He laughed carelessly over his humble origin; not, however, without feeling some justifiable pride in the success of his career. On one occasion, in the very height of his prosperity, he was entertaining a large company at his residence in Fermoy. Amongst the party were the late Earls of Kingston and Shannon, and the present Lord Riverdale. The conversation turned on Anderson's great success in life, and Lord Kingston asked him to what he chiefly attributed his rapid rise. "To education, my lord," replied Anderson: "every child in Scotland can easily get the means of learning to read and write. When I was a little boy, my parents sent me to school every day, and I had to walk three miles to the village school. Many a cold walk I had in the bitter winter mornings; and I assure you, my lords," he added smiling, "that shoes and stockings were extremely scarce in those days!"

He was not only quick in conception, but very rapid in explaining a difficulty. On one occasion he was very anxious to succeed in carrying a road-presentation for a new line, which he wished to carry on a level, so as to avoid a hill. The road was traversed at the assizes, and the matter came before a jury. The case was ill-managed, the lawyers only mystified it, and the jury were very thick-witted. The object and utility of the proposed road were not made apparent. Anderson, using patience, got upon the witness-table with his hat in hand, and said, addressing himself to the jury, "Gentlemen, I am *here* (pointing to the rim of his hat), and I want to go *there* (touching at the same time the other extremity of his hat). Whether is it better to go *thus* (describing the level circle of the hat), or go *this way* (making his finger traverse the crown of his hat)?" The jury at once understood his ideas in making the road.

The government so highly appreciated Mr Anderson, that a baronetcy was tendered him, which he declined. It was then offered to his son, and accepted for him, the present baronet, and well-known experimentalist in steam-coaching.

In his latter days, Mr Anderson suffered a serious reverse of fortune, in consequence of his unfortunate connection with a Welsh mining company; but 'he left behind him, in the handsome town of Fermoy, a noble monument of what can be accomplished by one man

possessed of energy and talent. The intellect of Mr Anderson was not very remarkable—it was probably inferior to many of his idle neighbours. His superiority lay in his moral qualities, in his determination to succeed, and his resolution never to be idle. He was no heartless adventurer bent on self-aggrandisement, no speculator upon the passions or follies of his fellow-men, using them as stepping-stones to power. He was a creator and a civiliser—a man who left behind him a splendid example of what industry and enterprise can achieve in a land where the vanity of the rich and high-born, and the slothfulness of the humble and the lowly, seek every possible excuse which their fond imaginations can invent for idleness and poverty. Ah, ye landlords! who are perpetually invoking government—and ye agitators! railing at Great Britain, why will you not take a lesson from an Anderson, and apply yourselves to the work before you of reclaiming not the land of Ireland from barrenness, but the people thereof from squalid indolence, beggarly dependance, disgusting poverty, and shameful waste of the powers and opportunities with which the God of nature has so plentifully endowed them? The value of a hundred landlords in Ireland, consuming rents, and careless of social development, I will not calculate; nor will I place the probable value upon a hundred agitators, bawling and bellowing from year's end to year's end. But when I look at the bright and cheerful town of Fermoy, so picturesquely seated on the Blackwater—when I think of its recent origin, and how one man, without the help of parliament or speech-makers, made that large and handsome town, I cannot help reflecting what a vast deal of good would result from the scattering of a hundred Andersons through Munster and Connaught—a hundred men, self-reliant, and enterprising—free from petty prejudice, and superior to the coarse passions of the time—a hundred strong men, too proud to look to parliament for alms, too pure to seek for gain in ministering to the delusions of the people!

Nor is that all which such a career as Anderson's should suggest. We are eternally told in Ireland of the evils of past times; of the cruelties of England at such a time; of the bigotry and of the tyranny of the Protestants in such a reign; of the tumult and rebellions of the Catholics at another time. All these past evils are pleaded to stop the censure of present apathy and of contemporary indolence. But what were these horrors to a man like Anderson? Did he turn aside from his work, to melt with "patriotic" sensibility over retrospective miseries and historical woes? He never troubled himself about these ideal evils; he treated Protestants and Catholics as he found them, with honesty and plain-dealing, and all due courtesies. He never canvassed for the applauses of the mob, nor courted by small arts the favour of the provincial gentry. Never cringing to the ruling powers, he was never their factious opponent. He never cried, like certain persons, "Do this for me, or else!"

Such are the men that Ireland wants. May her own sons, so rich in generous and noble qualities, waken up from idle dreams and fantastic designs, and manfully apply their energies in the beautiful country where God has placed them!

LOOK TO YOUR FEET.

Of all parts of the body, there is not one the clothing of which ought to be so carefully attended to as the feet. The most dependant part of the system, this is the part in which the circulation of the blood may be the most readily checked; the part most exposed to cold and wet, or to direct contact with good conducting surfaces, it is the part of the system where such a check is most likely to take place. Coldness of the feet is a very common attendant on a disordered state of the stomach; and yet disordered stomach is not more apt to produce coldness of the feet, than coldness of the feet is apt to produce dis-

order of the stomach; and this remark does not apply only to cases of indigestion, but to many other disorders to which man is liable. Yet do we see the feet of the young and the delicate clad in thin-soled shoes, and as thin stockings, no matter whether it is summer or winter-time—no matter whether the weather is dry or damp, or whether the temperature of the atmosphere is warm or cold. But this is not the whole of the evil. These same feet are frequently, at different times of the same day, differently covered as to the stoutness of the shoes and their soles, and very often likewise as to the thickness of the stockings. I have often found, on investigating into the origin of cases of disease, that it has been a common practice to go out of doors in the forenoon, the feet being protected with lambs'-wool stockings, and warm and thickly-soled boots; and to sit in the afternoon at home, only having the feet covered with silk stockings and thin satin shoes. I have so often found this to be the case, that it would hardly surprise me were the practice found to be almost universal among the females of the middle and upper ranks of society. To this common, and sufficiently inconsiderate practice, I have traced many cases of incurable disease. To this alone may be ascribed many a case of functional disturbance: this lays the foundation for many of those derangements by which the first inroad is made into the constitution, the first step taken in undermining the health; the first of that succession of changes brought about, by which the young, and the lovely, and the healthy, are converted into wasted victims of consumption, or become martyrs to other maladies as fatal, although less common. I am sufficient of a Goth to wish to see thin-soled shoes altogether disused as articles of dress; and I would have them replaced by shoes having a moderate thickness of sole, with a thin layer of cork or felt placed within the shoe, over the sole, or next to the foot. Cork is a very bad conductor of heat, and is therefore to be preferred; if it is not to be had, or is not liked, felt may be substituted for it. The extreme lightness of the cork, the remarkable thinness to which it may be cut—its usefulness as a non-conductor not being essentially impaired thereby—and the inappreciable effect it has on the appearance of the shoe—all seem to recommend its use for this purpose in the strongest manner. I think that neither boots nor shoes should be used without this admirable provision against cold feet. There is sufficient objection to all shoes made of waterproof or impervious materials: they are apt to prove much too heating and relaxing, interfering with the due escape of the cutaneous exhalations. Thin shoes ought only to be used for the purpose of dancing, and then they ought only to be worn while dancing. The invalid or dyspeptic ought assuredly never to wear thin shoes at other times. As to the common practice of changing thin shoes for warm boots, and *vice versa*, it is a practice that is replete with danger, and therefore rash, and almost culpable.—*Dr Robertson.*

GOD'S UNIVERSE AND THE POOR MAN'S HOME.

First, I would ask you just to contemplate for a moment in your minds the outward universe, so orderly, so beautiful, so richly replenished and adorned: the fields decked with flowers, as well as laden with fruits, the heavens glittering with countless stars. Remember how these things are spoken of in Scripture. 'Consider the lilies of the field how they grow,' and can you doubt that much more would God have done for man, the noblest of his creatures here below, fed, clothed, and lodged in comfort, to his own satisfaction, and to the glory of his Maker? Next, reflect what serious obstacles are presented by such poverty as I speak of, to the growth of almost every Christian grace. Let us leave the fields and flowers, the fresh air and pleasant skies, and let us enter some close tenement, some narrow lodging, perhaps a single chamber for a whole family, dark, dirty, noisome, pestilential, the occupiers in rage, and faint for want of food. I stay not to observe that the bird fares better in its nest, the bee in its hive: instead of contrasting mankind with the brute creation, I ask you to contrast this picture with the portrait of a Christian, as set before you in God's word. I ask you whether the beauties of the Christian character are likely to flourish in such an atmosphere as this? Will a man take no thought for the morrow who has no means of making provision for to-morrow's meal? Is cheerfulness or joyfulness easy of attainment under the pressure of cold and hunger? Can modesty bloom where common decency is impracticable?—*Rev. C. Girdlestone.*

BROTHERS! WE ARE MEN!

We are men—made in the image
Of the mighty One
Who hath crowned the earth with beauty,
'Neath the golden sun;
Children of a common Father,
Whose prevailing love
Is unbounded as the day-beams
Shining from above:
Highest rank in God's creation
Is our station, then;
Form divine is on our features;
Rulers o'er all meaner creatures—
Brothers! we are men!

In our souls the lamp of reason
Streams with hallowed light;
Intellectual glories round us
Shed their radiance bright.
Thus exalted in our being,
'Tis the will of Heaven
That we still go on improving
Gifts which He hath given;
Filling up our brief existence—
Threescore years and ten;
Loving virtue as a mother,
Doing good to one another—
Brothers! we are men!

We are men; but oh how often
Are our gifts despised,
And the dignity of manhood
Blindly sacrificed!
Oft is mercy's fountain frozen
In the human breast:
Millions sink beneath the tyrant,
Tearful and oppressed.
Cries of sorrow loudly echo
Over hill and glen;
Hapless thousands wildly grieving,
No kind hand their wrongs relieving—
Brothers! we are men!

Love's the lesson wisdom teaches,
Gentle are her words,
Sweeter than the brooklet's murmurs,
And the song of birds.
As we all are fellow-pilgrims
To a brighter sphere,
Why should strife attend the moments
Of our sojourn here?
For a higher purpose truly
Were we fashioned, when
Deity in fairest traces
Crowned our souls with heavenly graces—
Brothers! we are men!

Why should idle passions cheat us
Of our purest joy?
Why should pride the best emotions
Of the breast destroy?
In the heart, affection's fountain,
Sweetly welling up,
Seeks to mingle priceless blessing
Ever in life's cup:
Let its waters flow and mingle
Far as human ken,
Till with love's serene devotion
Earth be covered as the ocean—
Brothers! we are men!

Glasgow.

JAMES HENDERSON.

CHAMBERS'S LIBRARY FOR YOUNG PEOPLE.

Now issuing in small volumes, in fancy boards, at 1s. each.

Already Published,

ORLANDINO, & A TALE OF SELF-DENIAL. By MARIA EDGEWORTH.

LITTLE ROBINSON, AND OTHER TALES.

UNCLE SAM'S MONEY-BOX. By Mrs S. C. HALL.

JACOPO, AND OTHER TALES.

* * * To meet a very general wish, the volumes, during summer, will be issued every two months, instead of monthly. The next volume, therefore, will appear on the 1st of June.

EDINBURGH, April 1848.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. & ORR, 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 225. NEW SERIES.

SATURDAY, APRIL 22, 1848.

PRICE 1½d.

A WORD ON FUN.

SOME people might consider this as the age of great mechanical appliances, or great economical and political modifications—the age of steam, the age of free trade, the age of reform; and so forth. Perhaps it might be more distinctly characterised as the Age of Mirth or Comicality. Certainly joking is carried to a height which it was never known to attain in any former epoch. One may now enter a company, and never hear one word spoken in earnest during the whole evening, nothing but a rattle of 'quips, and cranks, and wanton wiles,' from beginning to end. I remark of one or two young friends of mine—chiefly barristers—that throughout many years I have had to interpret their meaning in the exact reverse of their language, as they are pleased to deliver themselves only in the manner of irony. Some whom I know to be worthy and kind-hearted, assume a biting, taunting tone of speech, as if very idleness, and the easy-chair state of all things in this too-favoured country, had utterly corrupted them. It is a very unfortunate state of things for those who, like myself, continue to think and speak of things pretty nearly as they appear, and strain in general to preserve a sober and equable spirit, for now the world is wholly out of harmony with us. If we enunciate a plain, simple truth, it is sure to be taken out of our mouth, and carried off in a whirlwind of ridicule. If we sit silent, we are treated only to comical and sarcastic observations on men and things, or to language purposely cast in a mould of exaggeration and distortion, in order to turn the things to which it refers into ridicule. A few hours spent in this way leaves us with the taste of cinereal fruit upon our lips, or the sense of having wandered through a tangled wilderness, where journeying gave neither pleasure nor instruction—only fatigue.

Thus your joking people are themselves, I fear, no joke. Had I not a partiality for mild terms, I should rather be disposed to describe them as social pests. Wherever they go, they spread their disease—the habit of ridicule: it flies about like the measles or the scarlet fever; and as with the measles and the scarlet fever, the young take the disorder more easily than the mature. Those who indulge the habit are generally supposed to be very witty; but this, I again fear, is a mistake: the greater part of them are merely reckless and ill-natured. Ill-natured fun causes much more laughter than the finest wit or richest humour. A delicate stroke of genuine wit will be appreciated by few in a company; while an ill-natured imitation, or a caricature of an absent acquaintance, will set a whole host of barren spectators in a roar. The greater part of the fun that is going is thus not only not amusing to a right-spirited person—it is positively tedious and disagreeable. No-

thing can be more annoying to an enlarged and rational mind, than to be compelled to remain in contact with one of these ridicule-loving natures, that persist in seeing something funny in everything. No reverence have they for high and solemn things—no enthusiastic admiration for noble and virtuous things—no love for good and beautiful things. High, solemn, noble, and beautiful, are qualities they only appreciate on account of their susceptibility of being turned, by means of their everlasting Harlequin's wand, into burlesque. Of men who are carried away by one small idea, a few may occasionally be met with in the *lowest* walks of science or art. Of such a one the poet says, with beautiful indignation, he

'Would peep and botanise
Upon his mother's grave.'

What would he say of the man who should go to his mother's grave and make a joke of the quaint wording of the epitaph? The regular lover of the ridiculous is quite capable of this: nothing is sacred to him; he would burlesque Homer, and travesty 'Paradise Lost.' He would see nothing to admire in the Elgin Marbles, but a great deal to laugh at; he would paint a caricature of Raphael's 'Transfiguration;' he would jest on skulls and coffins, on life, and death, and love, and immortality. Ridicule is a greater iconoclast than Mohammed or John Knox. It throws down the statues of great men, the saints and heroes of a past age; it shivers them with its iron Harlequin truncheon, and uses the fragments as missiles against the great men of the present day. Like many a deadly destroyer, it calls itself, and persuades others to believe that it is, a reformer. A pernicious falsehood, unjustly attributed to Lord Shaftesbury, once got current in the world, and is often acted upon even now: you will find many who make ridicule the test of truth.

Miss Landon said truly in one of her novels ('Francesca Carrara,' I believe), that 'too great love of the ridiculous is the dry-rot of all that is high and noble in youth.' It is painful to observe the mocking spirit, the *persiflage*, the satirical tone which pervades most of the youthful circles around us. Like a canker, it consumes the better part of their nature. They are incapable of deep affection for others. It has passed into a proverb that such persons 'would sacrifice their best friend for a *bon-mot*.' Vanity and frivolity of intellect must be about equal in such natures, whatever may be their cleverness in seizing and turning to account all that they observe around them. Those who seek the ridiculous in all things, can never, no, never, become artists, or appreciate art; those who are on the look-out for the ridiculous, will never discover the beautiful—they will not even see it when it is pointed out to them. They wear strange spectacles, which distort forms, and give a false colouring to objects.

They could look at the Venus de Medicis, and find something droll in it; but they could no more see its beauty than they could see it at all if they had been born blind. Neither can those who love the ridiculous before all things, love science, or search out her truths. Such love, and such seeking, demand serious and constant self-devotion to the pursuit of truth: self must be forgotten in strict investigation; and all the pomps and vanities, the pudding and the praise, the enjoyment and the fun which the world affords, must be matters of perfect indifference to the man of science. So far from loving science, the habitual ridiculer looks upon her votaries as amongst the most absurd and laughable sights under heaven.

And whence comes all this diseased love of the ridiculous? From ignorance, from idleness, from vanity. First, people are ignorant, and they laugh at what they do not understand; then they are idle, and go on laughing, because it is easier to laugh than to try to understand; lastly, they are vain, and keep on laughing, because others fancy they must be superior to all they laugh at, and because they half believe it themselves.

If, in what has been said above, I have not exaggerated this evil of our age, I shall rejoice to be the means of directing the reader's attention to it. Do not encourage in yourself a disposition to turn all things into a jest or a satire; resist as much as possible the influence of the surrounding spirit of mockery; keep your mind intent on high things; be earnest, be truthful, be loving, and you will never be a scoffer or an ill-natured satirist. You may, nevertheless, have a keener relish for true humour, and a finer perception of wit, than those who run wild after the ridiculous. The most delicate, the sharpest and most polished wit, does not raise a loud laugh; it awakes a bright smile of pleasure, as at the sight of a newly-created piece of beauty, and then the smile passes away into the expression of admiration. The richest, rarest, most exquisite humour, is more nearly connected with a tear than with a broad grin. These the most refined mind may intensely enjoy, without being in the least danger of falling into the slough over which I would here erect a ticket of warning.

A PASSAGE OF MEXICAN LIFE.

I HAD made up my mind, before returning to the sea-coast, to visit the presidio of Tubac, and bade my guide Anastasio to hold himself in readiness for the journey. Pressing matters of business, however, required his presence in a distant quarter; it was therefore agreed that he should conduct me to a place from which I might find my way alone, by adhering implicitly to the instructions he would give me as to the route. Having completed our preparations, we started the next morning before daybreak. Besides a small quantity of pinola in a valise, we each carried a goatskin filled with water, as the route lay across a region entirely devoid of the precious element. Believing this to be our whole stock of provisions, I was surprised when daylight came to see a sheep's head, newly cut from the carcase, hanging to Anastasio's saddle, and inquired what he intended to do with it.

'It is our hope for to-morrow's breakfast,' he answered: 'it will be the last meal we shall eat together, and I should like you to say whether you have ever eaten anything more juicy than a sheep's head (*tatemada*)—smothered—seasoned with pimento, and basted with brandy. I carry all that we shall want in one of my *mochilas*,' he added, pointing to the leathern pouches worn by travellers.

In proportion as we advanced, the country presented a new aspect. At first a few scarcely-beaten paths had guided us into the solitudes, but these tracks ended in immense prairies, without trees or bushes, but which, covered with tall grass, that bent at the least breath of air, presented the appearance of an agitated gulf surrounded by blue hills. So extensive were these plains, that the horizon seemed always to flee before us, notwithstanding the speed of our horses; and we were still in the interminable savannas as the sun went down. We kept on, however, steering our course by the pole-star, until we reached the borders of the sandy regions, where we halted under the shelter of a little wood.

As soon as our frugal repast was over, Anastasio thought of the next morning's breakfast; the preparations for which are worthy of record. With his knife he dug a hole in the loose soil, about a foot in depth and diameter, and filled the cavity with dried leaves, which he set on fire, and threw in a handful of light branches. On this a pile of thicker sticks was placed, and covered with a layer of pebbles. As the wood burnt away, the stones became hot, and with the decrease of the fire, sank to the bottom of the hole. The sheep's head, with its woolly covering, was then thrown into this oven, and the orifice closed with green branches, over which the operator trampled several layers of earth. When this was done, Anastasio announced that we had nothing to do but to sleep until morning.

The next day, as soon as the sun appeared, Anastasio saddled our horses for the last time; he then drew the skins of water from the bushes, where they had been placed to be kept cool, and put his brandy flask within reach. The hole in which the sheep's head was baking was next to be opened; the knife had scarcely touched the covering of earth, when a savoury odour arose from the cavity. The appearance of the *tatemada*, when first drawn out, was but slightly appetising: it looked like a burnt shapeless lump; but Anastasio, removing carefully the black crust, brought into view the juicy meat beneath; and it must be confessed that our parting meal was one of the most delicious. At last the moment of separation came; always respectful, my guide advanced to hold my stirrup: I pressed his hand as that of a friend; my course lay to the north, his to the south, and we soon lost sight of each other.

Anastasio's multiplied instructions relieved me of all inquietude as to the path I was to take, and I pushed resolutely forwards. So temperate are Mexican horses, that I could count upon my animal being able to traverse the distance that separated us from a small river without drinking. My goatskin was half full: it was scarcely eight in the morning, and I had ten hours of sun before me; but the sun which lighted me on my way, at the same time burnt up the desert. As it rose higher above the horizon, a scorching reflection rose from the sandy soil; the south wind dried my lips; it seemed that I was breathing fire instead of air. I went on thus for two hours, when a strange weakness seized me, a shudder ran through my whole body, and I shivered with cold on the scorching plain. After struggling with the malady for some time, I dismounted, hoping to warm myself upon the hot sand. A devouring heat, in fact, succeeded, during which I finished my last drop of water without thinking of the future. Meantime the sun rose higher, and increased the suffocating heat. I tried to remount my horse, but fell down again in extreme lassitude, while my thirst became more ardent than ever. New attempts only served to convince me more of my inability. I was yielding to the heavy effects of a drowsy languor, when a distant noise struck my ear, similar to that of a dragoon's sword rattling against his spurs. Shortly after a horseman, well armed and mounted, stopped before me: I opened my eyes.

'Holla! friend,' he cried in a rough voice, 'what are you doing there?' My long beard, and worn and dusty garments, were perhaps an excuse for this impe-

rious and familiar inquiry. I was, however, annoyed, and replied at first bluntly, 'Do you not see I am occupied—dying of thirst!'

The stranger smiled. A distended skin hung at his saddle-bow; the sight of it, while redoubling my thirst, dispelled my pride. I spoke again, and asked the unknown rider to lend me the precious object.

'Heaven forbid that I should refuse you!' he answered in a milder tone. I stretched out my hand greedily; but the horseman, seeing me disposed to empty the skin, filled a calabash, which he held out to me. I swallowed the contents at a draught. When I had somewhat recovered, my benefactor inquired where I was going.

'To the presidio of Tubac,' was my answer.

'To the presidio of Tubac!' he repeated in astonishment. 'By San Josef, your back is towards it!'

In the bewilderment caused by my fever I had forgotten Anastasio's instructions, and mistaken the route. The path I was following, as I could see by the sun, led to the west.

'Listen,' said the stranger, as he again gave me to drink, but as parsimoniously as the first time; 'by sundown you may reach the *hacienda de la Noria*. Take my advice, and go there; you will be well received.'

I alleged my extreme weakness. He reflected for a moment, and then continued—'I cannot wait to conduct you: imperious reasons compel me to be far from here by the close of the day, and motives not less powerful ought to prevent me from going to the hacienda; but as my road passes close by, I will call, and have some water and a spare horse sent to you; for exhausted as you and your beast appear to be, you cannot arrive to-day unassisted: and in these waterless solitudes, with such a sun as this, he who does not arrive to-day, will not arrive to-morrow. Try, however, to regain a little strength, and advance slowly. If you follow, step by step, the trace of my lasso, which I will let drag upon the sand, you will not be likely to go astray again.'

I thanked him warmly for his good intentions. 'A last caution,' he said: 'do not forget to say that chance alone takes you to the hacienda.' With these words he loosened the coil of his leathern rope, and rode off at a brisk trot, leaving a slight furrow upon the sand. The hope of soon arriving at an inhabited place, and the water I had drunk, gave me a slight renewal of strength. For the first time my position appeared to me such as it really was, and I remounted my horse; but the poor animal had not, as I, been able to appease his thirst: with drooping head and ears he crawled, rather than walked, notwithstanding the persuasion of the spur. From time to time I stopped, trying to discover the scarcely-visible traces of the lasso upon the sand, and hoping to hear the voices of those sent in quest of me; but all was silent; and I then continued my way, mechanically repeating the words, 'He who does not arrive to-day, will not arrive to-morrow.' The sun was already getting low, the sand sent up a scorching heat, and the hum of insects announced the coming darkness. Physical pain again began to heighten mental anguish: I felt my tongue swell, and my throat on fire. All at once my horse neighed; and as if some mysterious communication came to him upon the wind, set off at a more rapid pace; and I, just, as the sun was sinking behind a stripe of wood at the horizon, fancied that I heard the distant lowing of cattle. In another half hour I reached the trees behind which the sun had disappeared. An immense plain stretched before me, presenting a most radiant spectacle, only to be appreciated by those who have been tortured with thirst in deserts of unknown extent.

An immense carpet of bright green turf, intersected with numerous paths, covered the surface of the plain. Numerous gum-trees, thickly grouped, formed a pleasant shelter. The cool damp air which caressed my face, still inflamed with the heat of the scorching waste, announced the presence of water, fertilising the delightful oasis. In fact, a large cistern, supplied from

an abundant spring, stood under the shade of a few trees at a little distance. An enormous wheel, turned by four pairs of mules, poured a continual supply of water from the leathern buckets on its rim into the hollowed trunks of gigantic trees, where it sparkled gloriously in the beams of sunset. In these enormous troughs the numerous cattle came to drink, while at a distance a troop of horses were leaping and galloping in formidable tumult. Jackals, and other nocturnal depredators, driven by thirst, seemed to forget that the sun was yet shining, and the presence of man, and showed their lank muzzles at a distance, eager to drink of the spring, which poured out its streams for all. Such must have been the encampments of the Biblical ages, formed by the tents and dependents of the patriarchs.

In an instant, horse and rider, we began to drink as though we wished to drain the fountain. While stopping to take breath, I heard voices behind a little clump of trees, which I soon made out to be those of two men playing at cards. I learned, as they continued to converse, that one of them had been sent to my assistance; but meeting with a comrade here on the skirts of the hacienda, the unconquerable love of gaming, born with every Mexican, made him sit down to play, leaving me to take my chance. I rode round, to show that his services in my case would not now be required: the only remark he made was one of pleasure at being able to prolong his game. I left them at their cards, and leading my horse, walked down to the hacienda. It was yet at some distance, and twilight was darkening the landscape as I passed long rows of posts on either side of the path forming the cattle enclosures. One was deserted, but in the other thick clouds of dust were driven about. Approaching nearer to the fence, I saw a bull struggling furiously, with a man upon his back, armed with a knife, while another individual was holding a cord passed several times round the animal's legs. The rider seemed to be paring down the bull's horns, and sharpening their extremities; the beast, finding resistance vain, at last lay still, when the man dipped a thick bung into a calabash, and rubbed it several times up and down the horns, as though to coat them with some liquid preparation. As soon as the operation was over, the bull was released from his fastenings; and before his rage had time to vent itself, his two tormentors had reached the entrance to the enclosure, and barricaded it with strong beams on the side opposite to that where I was standing. In the rider of the animal I recognised the horseman who had relieved me in the desert some hours previously. What motive could have induced him to stay at the hacienda, fearful as he appeared to be of calling there? It was a mystery I could not explain, and my thoughts were still occupied with it as I walked into the courtyard of the building.

During my residence in this place I witnessed many remarkable incidents highly characteristic of the people and the country. The one, however, that made the most impression upon me is intimately connected with the circumstance above described. The day after my arrival was an anniversary, in which all the horsemen of the establishment vied with each other in showing their skill and dexterity in managing the half-wild animals beneath them. To a stranger, the sight was most interesting and exciting, so great appeared the hazard, and such the daring exhibited. After several hours passed in this way, one of the men came up with a bundle of short lances under his arm, and immediately a cry was raised for Cayetano, who, to my great surprise, was invested with the office of mayor-domo, or major-domo, of the establishment, and who had undertaken to break a weapon with the bull.

A single bull only remained in the spacious enclosure; it was the one I had seen thrown down the previous evening. Cayetano, whose features showed the traces of envious passion, took one of the *garrochas*, or short lances, and entered unaccompanied into the arena. The bull was released from the tether by which he had been fastened to a post, and needed no exciting to rush to

the attack. Cayetano made a few passes as an accomplished cavalier, to avoid the first assault, and waited a favourable moment for a thrust. The opportunity soon presented itself; the bull stooped to collect his strength for a new rush, and immediately the point of the garrocha was buried in his shoulder-joint, and his opponent's vigorous arm held him at bay; but as he looked round in triumph, the lance broke, and in the first moment of surprise, he was unable to escape the charge of the infuriated animal. With a sudden start Cayetano brought his hand to his thigh, where a few drops of blood stained his white linen drawers. An imprecation burst from his lips, more in rage at the humiliation than from pain; he asked for a new lance, and moved towards the opposite end of the lists.

A few minutes passed before the weapon was brought, when he again advanced to meet the bull. Cayetano's manner, however, betrayed a singular hesitation: I knew it could not arise from fear, as I had once before seen him cool and collected in more critical circumstances. An air of dejection that speedily followed the former uncertainty was still more inexplicable, for no blood had followed the first few drops upon his leg. At last, just as he was lifting his lance mechanically for another thrust at the bull, his horse reared, shrunk back, and to the general surprise, the rider offered no resistance, but suffered himself to be carried from the enclosure. Mingled yells, hisses, and hootings were lavished upon him in his flight. Cayetano, however, appeared to be insensible to the contumely; he reeled in the saddle like a drunken man, while his face assumed a death-like pallor.

'The chaplain! the chaplain!' cried several voices in an ironical tone: 'there goes a Christian in danger of death,' and another volley of hisses followed the major-domo, who appeared to be universally detested. But the chaplain, who had shown much interest in the spectacle, seemed unwilling to quit his seat, or to consider the call on his functions as serious, until at a sign from his chief he mounted his horse reluctantly, and rode after the fugitive.

The bull had profited by the tumult to make his escape to the forest, without any one offering resistance. This result was not at all to the taste of the numerous dependents of the hacienda, and they finished the day with new feats of horsemanship. Late in the evening, on returning to the house, I met the individual to whose passion for card-playing my life had nearly fallen a sacrifice the day before, and inquired what had become of Cayetano, when, to my astonishment, Juan, for that was the man's name, told me that the unlucky major-domo was dead. 'Dead!' I exclaimed; 'he was scarcely wounded.'

'True,' replied the other; 'but it appears that the bull's horns had been washed over with the juice of the *palo mulato*,* and the death of his antagonist was as horrible as it was rapid. You have not forgotten the stranger who relieved you in the desert, and called here to send you assistance; well, this man, Feliciano, is brother of one of Cayetano's former friends. This friend was acquainted with a secret, of which our major-domo would have liked to deprive him, and of his life at the same time, and had communicated it to his brother, together with his suspicions of Cayetano's character. These suspicions were but too well founded. One day Feliciano's brother went out in a boat with his treacherous enemy, and was never seen afterwards. Feliciano then suspected that his brother had been made away with, and commenced a search for the murderer. Having heard that Cayetano was living here, he started for the hacienda, and arrived just in time to see his enemy die—and without confessing.'

While we were speaking, the chaplain with another horseman came up: from their conversation, I learned that the poisoning of the bull's horns was regarded as an inexplicable mystery. The singular operation, how-

ever, of which I had been a spectator the previous evening, without being myself seen, left me no reason to doubt that Feliciano had adopted it as a ready and effectual means of satisfying his vengeance.

THE BATH POSTBOY.

It was in the early part of the last century, when the mail was transmitted from the principal towns of England in charge of a mounted postman, with holster-pistols and saddle-bags, and carried from the smaller ones by poor boys, who received a halfpenny a mile for serving the post-office in all weathers, that the postmaster of Bath informed all whom it might concern, by a printed bill in the window, that a smart active lad of fifteen or thereby was required to carry the mail between that town and Marlborough, at the above-mentioned rate of wages.

The road was long and rough; and three days had already passed, during which the mail was carried by the postmaster's own good boy, and man-of-all-work, much to his discomfort, and the manifest dissatisfaction of the good people of Marlborough, to whom their letters came several hours too late: but no candidate for the situation had yet presented himself. At length, on the fourth morning, which was that of a sultry July day, a thin, muscular, intelligent-looking boy, dressed in the habiliments of earlier years, which he had evidently outgrown, made his appearance, cap in hand, before Mr Burton the senior clerk, and inquired, 'Sir, if you please, would I be old enough to carry the Marlborough bag? I'm only fourteen yet, but I'll always be growing older and wiser I hope.'

'And maybe worse!' muttered the clerk, who happened to be out of temper that morning. 'But step in here,' he continued, pointing to another room, 'and Mr Leatham will see what you're fit for.'

Mr Leatham was a quiet elderly gentleman, who had kept the post-office for several years in the rich and gay city of Bath, which was, at the period of our story, the resort of all the fashionables of Britain, especially in the summer season, resembling in that respect what Brighton has since become. He spoke to the boy more civilly than his clerk had done; said he considered him tall enough for the business; and then inquired what was his name, where his parents lived, and if he knew any respectable person who would give him a character for honesty and sobriety, as without such a certificate the post-office could not employ him? The boy answered that his name was Ralph Allen; that his father had been a poor tradesman, but he was dead, and his mother supported herself by taking in washing; and 'I wasn't brought up here, sir; but my mother came in hopes of getting fine work from the gentry; and here's a certificate from a kind gentleman, the vicar of our parish: I used to run errands for him, and he said it might be useful to me.'

'This is to certify that Ralph Allen is a sensible, honest, industrious boy, and I hope will continue to be so.—William Warburton,' said the postmaster, reading aloud. 'Well, that's a good certificate, though the writer is unknown to me; but we will let it pass for this time, and take you on trial.'

After several exhortations to be careful of the mail, and walk fast, that he might arrive in time, Ralph Allen was duly equipped with a leathern bag, suspended by a strap over his shoulder, containing all the letters and newspapers in those days transmitted to Marlborough, and sent forth to earn the halfpenny per mile.

Day after day he performed that appointed journey, through sun and shower, going and coming to the entire satisfaction of the postmasters of Bath and Marlborough. Roads were not then so convenient for travellers, nor time so precious with the public, as at present; but Ralph was never known to loiter by the way, nor arrive an hour too late, which could seldom be said of other postboys. Travellers between the

* A species of poisonous sumach.

towns soon began to know him on the road, and remarked from stage-coach, wagon, or saddle—the only modes of conveyance in those days—that his conduct was always careful and steady; and people who did not travel trusted him with small messages in consequence of their reports. If a lady wanted a fashionable cap from Bath, or a notable housekeeper some trifle which could be bought cheaper in Marlborough, Ralph Allen was known to be a soberer and less exorbitant carrier than either the coachman or wagoner, and he was preferred accordingly. This was a source of additional gain, which increased every day, till the boy generally reached his destination in either town laden with parcels of all sorts and sizes, for the carriage of which he received from twopence to a farthing, as the case might be, or the liberality of his employers dictated. How the short time allowed between the close of his daily duty and his nightly rest was usually spent in his mother's poor but clean garret, nobody could tell; till Mr Leatham, who had by this time a high opinion of his postboy for general good conduct and correctness in his station, inquired one morning, while Ralph waited for the mail, what book was that protruding from his pocket?

'It's the "Universal Spelling-Book," sir,' said Ralph, reddening as he pulled out the well-worn volume. 'I try to learn at home in the little time I have, and can now nearly read.'

'That's well, my boy,' said Mr Leatham: 'I wish the rest of our boys would spend their leisure time so.'

'And, sir,' continued Ralph, now encouraged to speak out, 'I'm trying to write too, and have got the master of the Blue-Coat School to give me a lesson sometimes for doing his messages, sir.'

'You'll be a clerk yet, Ralph,' said the postmaster laughing. 'But it is a good endeavour, and I hope you'll succeed; but mind be careful of the mail.'

His employer's words turned out true, though spoken half in jest. Ralph continued to earn, by every honest though small way within his reach: his earnings were saved to purchase an old book when he could not borrow it, or supply himself with pens, ink, and paper; by which he at once amused and improved his few leisure hours in reading, or even spelling, to his mother, when her day's toil was also done, and practising the chance lessons he could obtain from the schoolmaster. Reading was at that period a rare thing in his class, and cheap books of instruction were equally so; but from the spelling-book, Ralph Allen advanced to the dictionary and grammar; from 'strokes,' to writing a good fair hand. His savings also increased by slow degrees, for both he and his mother were prudent; and Ralph only wished for the time when he might aspire to some better situation, and be enabled to add to her rest and comfort. Five years had thus passed away; Ralph Allen had grown almost a man, when all the message-senders of Bath, amongst whom he was well known, rejoiced, even amid their regrets that they must look out for another carrier, to hear that Ralph Allen had been promoted, through the kindness of Mr Leatham, to a clerkship in the Bath post-office, and was actually seen in a new suit of clothes performing his new duties at the post-office window. After this his mother washed nothing but lace and cambric, and Ralph was as steady and obliging in the post-office as he had been with the mail on his back. His salary was comparatively small, but his prudence was great; and in another year or two, people discovered that Ralph had something in the bank. His habits of reading and thought also gave him an ability to invent useful improvements in the post-office, which was then very imperfectly managed. These were modestly proposed; and as their necessity was seen, they soon obtained the sanction of the superior authorities, and raised the young clerk not only in their estimation, but in office also, as in three years after his entrance he succeeded the senior clerk, Mr Burton, by whom his application for the carriage of the Marlborough bag had been so ungraciously received, and who now retired to a

small property he had purchased in the country. Two years more, and Ralph himself began to think of purchasing property also. There was a large sterile farm called Coome Down in the neighbourhood of the city, which the last three tenants had successively left in disgust and weariness, declaring that their labour and money both were lost on such an unprofitable spot, and the landlord offered it for sheep-grazing on the very lowest terms. Great was the astonishment of all who knew him, when Ralph Allen became the purchaser of these poor and barren acres. Some said the young man's brain was turned with the books he read, and even his mother shook her head, and hoped it would turn out for the best; but Ralph gave up his situation in the post-office, collected round him workmen and tools, and commenced, not without creating much wonder and many surmises, to break up the ground in all directions, as if in search of a mine.

'Neighbour, do you expect to find a pot of gold in that farm?' said an old farmer to him over the fence one morning, where he and his men were delving at a rocky spot that never could be cultivated.

'No,' said Ralph; 'but I expected, and, thank Providence, I have found, a good stone quarry, which will repay me, and be useful to yon good town;' and he pointed to the spires of Bath.

'My stars!' cried the farmer, 'he's not mad after all!' And so thought all Ralph's neighbours, when buyers came and workmen thronged to the new quarry; and scarcely a gentleman's house or public building of any description could be commenced in Bath without a supply of stone from Mr Allen, as the Bath postboy was now deservedly called.

Mrs Allen had long given up washing, and gone to reside in a neat cottage which her son built out of the first produce of his quarry; and many of her former employers saluted the good woman as she passed to St Mary's church in her black sarsenet sac, high-heeled shoes, and velvet hood, like a respectable old lady of the period. About this time the works of the great Dr Warburton were attracting public attention, and much talked of in the best society of Bath. Ralph Allen brought the latest published volume home one day, and found his mother seated in the small parlour with his old friend Mr Leatham, who was about to retire from public business, and had called to see him. 'What books you do buy, Ralph!' said the old woman, who had always a suspicion of her son's extravagance on this point; and she pointed to a large book-case, where Dryden, Tillotson, and all the best authors of the preceding age might be seen in their works, closely ranged together. 'It was only last week,' continued the good dame, 'that you brought home that book about fame, written by one Mr Pope.'

'And don't you know, mother, who is the writer of this volume?' said Ralph. 'Don't you remember Mr Warburton, the parson of our own Greasley, in Nottinghamshire, who gave me the certificate which I presented to you, Mr Leatham, ten years ago, when I wished to be postboy to Marlborough?'

This was true; the vicar of Greasley became the celebrated Dr Warburton, afterwards Bishop of Gloucester; and it was said Mr Leatham's family kept that certificate like a sort of relic.

'Ralph Allen's making his fortune' was the usual remark of everybody about Bath when the quarry was mentioned; and it had now grown an important matter, as the whole property of Coome Down, which so many farmers had called a dead loss, was found to be one vast bed of the best building stone.

Ralph was making money fast, and his deposits in the bank increased every year; but his aims did not end there—the experience of his former situation in the post-office was at length employed to some purpose. Sundry useful arrangements and inventions had long ago made his name and abilities known to the authorities of that department. At the period of our story, the post-office in almost every county was farmed by

some wealthy or enterprising person, who took its whole revenue and expenses in his own hands, paying to the government a certain sum annually, according to his contract. Ralph, who had acquired a considerable acquaintance with all the details of the business, and had, besides, the good opinion of the most influential functionaries, proposed to vest the small fortune already gained by the Coome Down quarry in a post-office contract for all England; and his proposal was accepted. From this period the career of Ralph Allen was one of uninterrupted prosperity. Under his administration, the post-office revenue, even in that age of comparatively little letter-writing, was almost doubled in a few years, owing to the better arrangements introduced by him in the transmission of mails, and various postage regulations, which have made his name celebrated as one of the few who have conferred benefits of a lasting kind on their native country. But Ralph Allen was destined to become, if possible, still more honourably known to fame. From his earliest youth he had cultivated his mind, as well as improved his fortune; as without the former endeavour, the latter would have been but half success, though wealth had been gathered like the sand. His post-office contract in a short time realised such an income, as made the proprietor one of the richest men in the neighbourhood of Bath.

Mrs Allen had lived to see her son's prudent conduct and perseverance rewarded to an extent of which she had never dreamt; and the good dame closed her days in peace and comfort in the pleasant cottage at Coome Down, having nothing to regret, and no annoyance, but a shadowy fear, which at times slightly agitated the calm current of her latter-day thoughts, that Ralph was buying too many books. But having gained the summit of his early ambition—a well and honourably-won fortune—he determined to enjoy it agreeably to his own refined taste, in the munificent encouragement of arts and literature. He had acquired general respect as well as riches; and as his fortune raised him gradually in the scale of society, had won the esteem, and formed the acquaintance, of men celebrated for their talents, and still famous through their works. Pope, Fielding, Swift, and Goldsmith, were among the number of his friends; and the titled and fashionable paid a natural tribute to merit and success, by including Mr Allen in their most select society.

The country round Bath is one of the finest districts in England, being diversified with beautiful wood-crowned hills and broad green meadows: one property, in particular, popularly called Prior Park, had long attracted Ralph Allen's eye from the barren slopes of Coome Down, and there, he often said, he should wish, if fortune permitted him, to build a mansion worthy of the scene. This project was at last put in execution. The possessor of the estate ruined his affairs by carelessness and extravagance in London: it was, in consequence, offered for sale, and Ralph Allen, Esq. became the purchaser of Prior Park. Here, on the slope of one of those wood-covered hills which he had often admired, a splendid mansion was erected under his own superintendence, whose beautiful Corinthian portico and tasteful decorations were the theme of praise among all the lovers of art; the former especially being still regarded as unrivalled in English architecture. Here Ralph retired about middle life, leaving the field of active industry to younger and more needy aspirants: here also he gathered round him the most polished society of that fashionable neighbourhood, and many of the authors, the purchase of whose works had once astonished his mother. Mr Allen is well known to all conversant with the literature of those times as its judicious and munificent patron, and, in particular, as the attached friend of the somewhat irritable poet, Alexander Pope, and the philosophic Bishop Warburton.

The facts of his story, though not so generally known, belong to real life, and are verified by his contempo-

raries. Prior Park has now become a Catholic college; but its romantic situation and fine Corinthian columns are still reckoned among the attractions of the district; and they offer a lesson of how much may be achieved by well-directed energy and persevering prudence.

NATURAL HISTORY OF THE DRAGON.

THE fate of the dragon is curious. Used as a figure by the Jewish prophets, and by one of the evangelists; celebrated by the poets of profane antiquity; assumed by the mediæval romancers as their chief stock villain; condemned by the wisdom of the moderns to one grave with the 'Gorgons, and Hydras, and Chimeras dire'; then risen anew in the present day, out of the bowels of the earth, to vindicate his own existence, and verify the wildest nightmare of poetry! 'There was a time,' says the author of the Bridgewater Treatise, 'when reptiles not only constituted the chief tenants and most powerful possessors of the earth, but extended their dominion also over the waters of the seas; and the annals of their history may be traced back through thousands of years antecedent to that latest point in the progressive stages of animal creation, when the first parents of the human race were called into existence.' . . . 'Persons to whom this subject may now be presented for the first time, will receive with much surprise, perhaps almost with incredulity, such statements as are here advanced. It must be admitted that they at first seem much more like the dreams of fiction and romance, than the sober results of calm and deliberate investigation; but to those who will examine the evidence of facts upon which our conclusions rest, there can remain no more reasonable doubt of the former existence of these strange and curious creatures in the times and places we assign to them, than is felt by the antiquary, who, finding the catacombs of Egypt stored with the mummies of men, and apes, and crocodiles, concludes them to be remains of mammalia and reptiles that have formed part of an ancient population on the banks of the Nile.'

These strange and curious creatures might be called *dragons*. 'Yes, dragons,' says the author from whose quotation we take the above sentences of Dr Buckland: 'not such as the small, living, winged reptiles that skim from place to place in search of their insect food, relying on their natural parachutes, constructed upon a somewhat safer principle than that of poor Mr Cocking, and rejoicing in the generic name of *Draco*, but downright enormous dragons, with bellies as big as tuna, and bigger—creatures that would not have cared much for Bevis's sword "Morglaye," nor that of the Rhodian Draconicide, nor St George's "Askalon," no, nor the "nothing-at-all" of More of More Hall, even if those worthies could have existed in the pettiforous region in which the said dragons revelled. For in a slough where *calamites* and other gigantic marsh plants, now extinct also, rooted themselves at ease, and reared themselves into a damp jungle; in a dreary bog, to which the undrained Pontine marshes would have been the land of health, was their lair. In such a nauseous quag, wholesome to them, these monsters roared and wallowed: there they growled their horrid loves, and there they made war upon each other—the strong devouring the weak, and the carnivorous "chawing up" the herbivorous in the midst of the wildest convulsions of a nascent world. While this was going on upon what then passed for dry land, great sea-dragons rushed through the waves, or sported on the surface of an ocean, not unlike, as far as the waters were concerned, our own; while flying-dragons

hovered, like Shakespeare's *witches*, through the fog and the filthy air.*

Amongst dragons, those of the sea deserve the precedence, for in all probability they existed first. There are two types well known to geologists—the ichthyosaurus and plesiosaurus; the former of which was sometimes thirty feet in length, with an eye larger than a man's head. This creature must have presented the appearance of a large predatory abdominal fish, with a head occasionally six feet long, jaws of corresponding size, armed with shark-like teeth, a short neck, and a long lizard tail. The eye, by means of a movable circle of plates with which it was provided, became a telescope or a microscope, just as the animal desired, and lighted its career amidst tyrannies and dangers by night and by day. The plesiosaurus was a worthy comrade of this original. 'To the head of the lizard,' says Dr Buckland, 'it united the teeth of the crocodile; a neck of enormous length, resembling the body of a serpent; a trunk and tail having the proportions of an ordinary quadruped; the ribs of a chameleon; and the paddles of a whale.' The great length of the former dragon was in the tail: in this it was in the neck. 'That it was aquatic,' reasons the Rev. W. Conybeare, 'is evident from the form of its paddles; that it was marine, is almost equally so from the remains with which it is universally associated; that it may have occasionally visited the shore, the resemblance of its extremities to those of the turtle may lead us to conjecture: its motion, however, must have been very awkward on land; its long neck must have impeded its progress through the water; presenting a striking contrast to the organisation which so admirably fits the ichthyosaurus to cut through the waves. May it not, therefore, be concluded (since, in addition to these circumstances, its respiration must have required frequent access of air), that it swam upon, or near the surface, arching back its long neck like a swan, and occasionally darting it down at the fish which happened to float within its reach? It may perhaps have lurked in shoal water along the coast, concealed among the sea-weed; and raising its nostrils to a level with the surface from a considerable depth, may have found a secure retreat from the assault of dangerous enemies; while the length and flexibility of its neck may have compensated for the want of strength in its jaws, and its incapacity for swift motion through the water, by the suddenness and agility of the attack which they enabled it to make on every animal fitted for its prey which came within its reach.' Besides these denizens of the deep, there was the prototype of the *Monitor*, a gigantic lizard—sometimes five feet in length—which haunts the marshes and river-sides of warm countries. The marine ancestor of this creature must have reached the length of twenty-five feet, with a head four feet long. It was of the size of a grampus, with four paddles instead of legs, a great oar-like tail, and jaws and teeth entirely draconian.

Such were the sea-dragons in those ages of the world compared with which the antiquity of recorded time is but as yesterday. The dry land, or what passed for such, had quite as interesting a population. 'If, with the eyes of the imagination,' says Mr Broderip, 'aided by the lights afforded by the strata and the ancient inhabitants buried therein, we look back upon our earth when the forms of crocodilian reptiles first came upon it, we may picture to ourselves an oozy, spongy, reeky land, watered with wild rivers, and largely overspread by a vast expanse of lakes, on whose dreary, slimy banks gigantic crocodiles reposed amid enormous extinct bog-plants, or floated, log-like, in the fenny sunshine on their waters, while the silence of the desolate

scene was broken by the clank of their monstrous jaws, as they ever and anon closed upon the bygone generations of fishes, or by the growlings and explosions of the distant volcano.' Of the land monsters, the iguanodon was an elephantine reptile, twenty-eight feet long—a sort of innocent dragon, who made use of his grinders in the mere mastication of vegetable food; while his brother, the megalosaurus, a little larger, and a little more tun-like in form, crushed crocodiles and tortoises within his horrid jaws. The two tribes of herbivorous and carnivorous Titans must have fought bitterly for the championship.

While such creatures as these enjoyed the dominion of the land and sea, another class floated heavily through the foggy air. The fossil remains of the pterodactyle formed for some time a puzzle for geologists, who perhaps considered that the announcement of flying-dragons would be carrying their wonders a little too far. Cuvier, however, settled the question; and Dr Buckland accounts for the difference of opinion that prevailed by the presence of characters in the fossil, apparently belonging to each of the three classes to which it was referred. These characters are indicated by the bird-like head and neck—the wing like that of the bat—and the body and tail approaching to those of the mammal. 'These characters,' says Dr Buckland, 'connected with the small skull, as is usual among reptiles, and a beak furnished with not less than sixty pointed teeth, presented a combination of apparent anomalies, which it was reserved for the genius of Cuvier to reconcile. In his hands, this apparently monstrous production of the ancient world has been converted into one of the most beautiful examples ever afforded by comparative anatomy of the harmony that pervades all nature in the adaptation of the same parts of the animal frame to infinitely-varied conditions of existence.' Mr Broderip supposes this chimera to have shuffled along the ground after the manner of a bat, and scuttled through the water when it had occasion to swim. When rising into the heavy air, the membranous wing was expanded by the bones of the fore-foot; and when tired, it perhaps suspended itself by the hind-legs. 'The general hue of the body was probably lurid, and the texture of the skin shagreen-like, resembling in some degree the external tegument of a chameleon or guana, excepting the smooth membrane of the wing.'

Such were the dragons of the primeval world; and one could almost suppose that among the buried learning of the earlier nations there lurked some knowledge of geology, seeing how their ideas about dragons come to such a conformity in some respects with the realities of these pre-Adamite reptiles. It is strange that the poets, in their descriptions of the leviathan, which is concluded to have been the crocodile, should approach nearer to the real dragon-type than the crocodile itself! They have been ultra-liberal, it is true, in the articles of heads, crests, manes, and beards; but in all essential particulars they were as correct as a modern professor, who can not only number their bones, but measure their muscular development, describe their organs of sense and motion, and ascertain even the colour and quantity of their blood. The Lernean hydra, slain by Hercules, is placed by the ancients in its proper habitat—the mud and quagmires consequent on Deucalion's deluge: for the sake of this *fact*, its heads, varying in number, according to different authorities, from seven to a hundred, may be pardoned. These modern dragons are represented to have fed on vipers and scorpions, thus increasing their natural venom at every meal. A peculiar species of dragon kindled the air it breathed into flames; and the crowned basilisk, the terror of both men and dragons, destroyed animal life with a glance of its eye. The dragons of the marshes were said to be so large, that they killed elephants with ease. One that haunted the neighbourhood of Damascus was 140 feet long; and the intestines of another, 120 feet long, were preserved in the library of Constantinople, with the *Iliad* and *Odyssey* written upon it in letters of gold!

* Zoological Recreations. By W. J. Broderip, Esq., F.R.S. Colburn. 1847.

The scalds of the north, and romancers of the south, vied with each other in illustrating the popular idea; and in our own country more especially, 'nobody was anybody,' as Mr Broderip says, 'who had not slain his dragon.' The following is a portrait of the monster in Syr Bevis of Hampton:—

'When the dragon, that foule is,
Had a syght of Syr Bevis,
He cast up a loud cry,
As it had thundered in the sky:
He turned his body towards the son;
It was greater than any tonne;
His scales were brighter than the glas,
And harder they were than any bras:
Betwene his shoulder and his tayle,
Was forty fote without fayle.'

The combat of Syr Bevis and this wonderful wildfowl is supposed to be the prototype of that of St George and the Dragon.

Turning from the dragon of the old romance, we come to that of Spenser's Faery Queen, 'with its "wynges-like sayls, cruel-rending claws, yron teeth, and breath of smothering smoke and sulphur;" and then to that most striking passage in the Pilgrim's Progress, descriptive of the battle between Christian and Apollyon, who spake like a dragon, and when at last, says Bunyan in his dream, Christian gave him a deadly thrust, "spread forth his dragon's wings, and sped him away that I saw him no more."

Dragons, however, at length met the fate of the knights that slew them, and were put out of countenance by ridicule. The Dragon of Wantley was more fatal to them than the basilisk; and after the exploit of More of More Hall, the whole brood appears to sink into the earth, and disappear, like their ancestors of the pre-Adamite world.

'The Dragon of Wantley churches ate
(He used to come of a Sunday),
Whole congregations were to him
A dish of Salmagundi.
Parsons were his black puddings, and
Fat aldermen his capons,
And his tit-bit the collection plate,
Brimful of Birmingham halfpence.
The corporation worshipful
He valued not an ace;
But swallowed the mayor, asleep in his chair,
And picked his teeth with the mace!'

The pre-Adamite reptiles, although extinct in their species, are not wholly so in their genera. There is still a lizard called the *ambyrhynchus*, which may be said to represent, however poorly and inadequately, the sea-dragons of the primeval world. It is a hideous-looking creature, as described by Darwin, from three to four feet long, of a dirty black colour, stupid and sluggish in its movements. 'When in the water, the animal swims, with perfect ease and quickness, by a serpentine movement of its body and flattened tail, the legs, during this time, being motionless, and closely collapsed on its sides. A seaman on board sank one with a heavy weight attached to it, thinking thus to kill it directly; but when, an hour afterwards, he drew up the line, the lizard was quite active. Their limbs and strong claws are admirably adapted for crawling over the rugged and fissured masses of lava which everywhere form the coast. In such situations, a group of six or seven of these hideous reptiles may oftentimes be seen on the black rocks, a few feet above the surf, basking in the sun with out-stretched legs.'

We must not forget, however, another claimant—though Mr Broderip does—the sea-serpent—which grows more and more importunate every day. The last affidavit on the subject, given in the March number of the 'Zoologist,' is from a certain Joseph Woodward, captain of the Adamant schooner of Hingham, who states that he fired one of the ship's guns, loaded with a cannon-ball and musket-bullets, at the monster, himself and crew hearing the shot strike against his body, from which they rebounded as if it had been a rock. Cap-

tain Woodward reports the creature to have been about 130 feet in length, of a blackish colour, and with ear-holes about twelve feet from the extremity of his head. Another 'well-authenticated' report was made in 1833 by five gentlemen of Halifax, Nova Scotia, chiefly officers of the rifle brigade. The creature they saw was between 80 and 100 feet long; the neck was equal in girth to a moderate-sized tree; and that and the head of a dark-brown, or nearly black colour, streaked irregularly with white. In 1845 and 1846, the serpent-seers of the flocks of Norway describe the animal as being from 40 to 100 feet long; and what is very curious, he is invariably provided with a mane like a horse. This mane is a remarkable feature in the *fabulous* dragons of the middle ages! Dr Cogswell, in the 'Zoologist,' points out a strong resemblance between the extinct plesiosaurus, and the descriptions of the sea-serpent as given by unlettered persons; and he concludes that the argument *pro* and *contra* is satisfactory in favour of at least a suspension of judgment on the subject.

The great crocodile of the Ganges represents in some degree the amphibious dragons; but the iguanodon (the herbivorous dragon) has dwindled into the small iguana, five feet in length. 'The geographical distribution of the guanas extends over a great part of South America and the West India islands. Although they occasionally eat eggs and insects in a wild state, and in captivity have been known to feed on the entrails of fowls, their ordinary food consists of buds, leaves, flowers, and fruits, for the cropping of which their numerous teeth, which may be compared to small lancets, terminating in broad blades, with minutely-serrated edges, are admirably adapted. As this diet leads the guana to the trees, both form and colour conjoin to aid in securing its safety; the first enabling it to climb and stand firm on the branches, and the second going far towards concealing it in its leafy haunt. The long, slender, serrated, sharp-clawed toes, and lengthened flexible tail, here come into play; and the green, bluish, or slaty hue of the upper part of the body, together with the yellowish-green or brownish of the under parts, harmonise with its situation. Sometimes there are brown stripes or yellow-edged zig-zags on the sides of the body; sometimes there is an oblique yellow line on the forepart of the shoulder; some are dotted with brown, the limbs of others are mottled with brown on a blackish ground, and the tail is generally annulated with alternate large brown and green or yellowish rings. These variations are, however, in strict keeping with its sylvan habits. . . . These animals are oviparous: their eggs are round, with a thinner shell, or rather tegument—for it is tough, not brittle—than that of those of the common poultry, but with a white and yolk resembling that of a hen's egg in flavour. Nor is this the only delicacy supplied by the uncouth-looking guanas. They become very fat upon their wholesome diet, and are much sought after for their flesh, which is as white as that of a chicken, and equal, if not superior to it, when properly offered to the palate. The old authors confine their cookery to boiling and frying: thus Piso says that they love to feed on fruits and eggs, whence they derive much fat, and the whitish flesh "*qua elixa vel frigida inter delicias expetita, nec gallinaceis pullis cedit.*"' Dr Patrick Brown relates in his history of Jamaica, that he kept a guana about the house for two months without ever having observed it eat.

As for the flying-dragons, they have passed utterly away, for it can scarcely be said that they are represented in the little insect-eating parachuted reptile which bears this name. 'Pterodactyles have been succeeded by birds—ichthyosaurs, plesiosaurs, mosasaurs, and the like, by whales, dolphins, and great fishes. Where the herbivorous iguanodon revelled, the ox, the deer, and the sheep quietly crop the fragrant herbage; whilst in place of the destructive megalosaurus, the carnivorous mammalia keep down the excessive multiplication of the ruminants; and MAN has a dominion over all. In future ages, his remains will fill the bosom of

the earth; and the traveller in some far distant century will feel the full force of Byron's lines wherever he sets his foot:—

'Stop!—for thy tread is on an empire's dust!
An earthquake's spoil is sepulchred below!'

THE ENGLISH IN BORNEO.

SINCE the publication of Captain Keppel's late work, an outline of the contents of which we presented to our readers in Nos. 116 and 117, we have looked forward with much interest to the appearance of other portions of Mr Brooke's Journals. We have them now before us,* and a brief digest of the varied matter contained in the volumes may perhaps prove not uninteresting.

In January 1840, Mr Brooke visited the great and unexplored island of Celebes, for the purpose of collecting information concerning its strange laws, its almost everlasting internal dissensions, its populous and wealthy cities, its great rivers, its fertile and untraversed plains and unascended hills, and its huge natural caverns. He had much to contend with, but also much to gain. Rumours of his proceedings in another part of the Twelve Thousand Islands had no doubt reached the ears of the rulers, and the people of Celebes. It was a good thing, therefore, for him to show himself to them. A taste for European manners and European civilisation may hereafter spring up there; and if such prove to be the case, we shall attribute the sowing of the first seeds to the visit of the adventurous English traveller.

The Bugis or natives of Celebes are a strange race. Though those continually dwelling on shore are, on the whole, somewhat addicted to laziness, the traders are among the most adventurous and spirited of the inhabitants of the Archipelago. Their mercantile pursuits necessarily bring them into contact with almost all the other islanders; and while distributing the commodities of trade among the various islands, they must at the same time disseminate ideas; and if those ideas were the fruit of an intercourse with the civilised races of the West, the effect could not fail to prove beneficial. But treachery and avarice, those debasing qualities common to almost all nations in the dark stages of their existence, but more especially at the period when the first dim dawn of a better state of things is breaking upon them, are widely diffused. An instance of the atrocious extent to which kidnapping is carried in Celebes is related. 'A follower of the Rajah Kerain, who had assumed the character of a physician, came to the house of a relative of the nahodah; and after sitting some time in converse with the lady of the house, said, "I wish you would let some one carry my bundle to Nepoh, whither I am going." (Nepoh was three miles off.) The poor woman immediately said, "My nephew shall do it for you;" and the boy (about ten years of age) went with the pretended physician, as was thought, to Nepoh. Some days, however, elapsing, and the boy not coming back, his aunt grew uneasy; and setting some inquiries on foot, found that the man whom he had gone with was at Tempè. On being applied to, the miscreant coolly replied that the boy came back the same evening; the real fact being, that he had sold him as a slave, no one knew where. Under these circumstances, the nahodah applied to me to use my influence with the datu lampola, in order to recover the boy;

and I immediately applied to him, and received the fullest assurance that, if the boy was alive, he should be found. A week, however, passing, and no news being obtained, I renewed my instances more warmly; and urged that if the man would not disclose what he had done with the boy, he ought to be put in confinement. Such plain-dealing appeared, however, to be altogether out of the question, for he was a follower of the Arn Kerain! On farther inquiry, I learned that the *very rascal* who had stolen and sold the boy, had been sent to repurchase him with twenty-five reals of the datu's money.'

The boy was thus restored to his friends at the cost of L.4, 3s. 4d., which came out of the magistrate's pocket. The anecdote speaks expressively of the present state of affairs in Celebes, where a criminal must be bribed to make restitution for the wrongs he has done.

In an excursion which Mr Brooke undertook shortly after, in company with several rajahs and other important personages, he fell in with what he terms 'a cynical king, and his no less cynical mistress.' These were the king and queen of Akutaingan. Invested with all the power and dignity of royalty, his highness's fondness for the chase led him to despise all other occupations. He, therefore, abandoning his palace, delighted to dwell in forest or jungle, hunting the wild deer on horseback, with his young and beautiful wife constantly at his side. This lady appears to have been quite in her proper element when thus employed. Horses, dogs, and fighting cocks were her most familiar pets, and with them she loved to scour the woods and plains, along with her husband, whom Mr Brooke describes as partaking of the generosity of the horse and the sagacity of the dog. Our countryman says he is sure the pretty huntress of Akutaingan was intended for a better and a happier fate. We doubt whether she could have been happier. She had a kind lord, and was never in want of an agreeable pipe of opium. Furthermore, she had no idea of any other life, and therefore wished not for any change. How could her domestic felicity have been greater?

Here, in company with this hunting chief, Mr Brooke partook of the 'Feast of the Bloody Heart,' which to us seems, to say the least of it, a wild and barbarous custom, though the English traveller declares there is nothing revolting in it, not so much as in the practice of devouring oysters. Our readers shall judge. 'The game being killed, chillies, salt, and limes (always carried to the field) are brought, the heart taken out, and with portions of the liver and inside of the thigh, is minced and eaten raw with these ingredients, the sauce being blood!'

Having heard many extraordinary accounts of the great cave of Mampo, which the natives declared to have been the work of a dynasty of kings long in the grave, Mr Brooke underwent many fatigues in order to inspect it. As might have been foretold, however, it proved to be no artificial production. The first glimpse of the interior showed that time, and the accidents of nature, had been the only architects of the wonderful cavern of Mampo. It was not at all extraordinary, however, that the ignorant and credulous inhabitants should have believed it to have been the vestige of an ancient religion, since Mr Brooke compares it with the far-famed halls of Alhambra. On entering, a vast chamber, adorned with countless pillars of the most dazzling white material, presented itself to his gaze. The roof glittered with pendent stalactites of all shapes and sizes, sometimes connected by exquisitely delicate fretwork, while here and there, where crevices in the rocky flooring afforded earth and moisture, groups of young trees sprang up, and received on their heads the weight of innumerable green creepers falling in from holes in the roof, and twining in every direction

* Narrative of Events in Borneo, from the Private Journals of James Brooke, Esq., with a Narrative of Operations in H.M.S. *Iris*. By Captain Rodney Mundy, R.N. London: Murray.

about the cavern, which runs deep into the bowels of the mountain. We can scarcely imagine a more striking spectacle than that which must have presented itself at the time of Mr Brooke's visit. The hundreds of dusky figures with flaming torches, the mass of green creepers, whose dark, rich foliage contrasted admirably with the pure whiteness of the rest, and the varied and fantastic forms which the hand of nature had there moulded, combined to produce a picture in the highest degree exciting to the imagination.

On our countryman's return to Sarāwak, he found the province in so distracted a condition, with no probability of any termination of the period of anarchy, that thoughts of throwing up his schemes for the regeneration of the Archipelago, in utter despair, more than once occurred to his mind. The natural vigour of his character, however, triumphed over despondency, and he resolved to persevere. Soon after this, the rebellion occurred, which he assisted in putting down. The details, however, have been given to the public some months ago, and we have therefore no need to repeat them here.

Having seen much of the island of Borneo, its cities, its rivers, its productions, vegetable and mineral, its animals of all kinds, from the ponderous elephant to the creeping lizard; and hearing of its ancient trade in camphor, tortoiseshell, sandal-wood, cloves, bark, birds'-nests, and trepang, Mr Brooke determined at all hazards to make an effort to open its inestimable riches to the enterprise of the merchant. Convinced that every province, and Sarāwak in particular, might prove a mine of wealth, if properly worked, he thought no pains too great to be bestowed on the attempt, and therefore set about examining the materials with which he was to commence the gigantic labour.

He found the inhabitants uncivilised and ignorant. They had been accustomed, since time forgotten, to bloody and barbarous practices—murder, robbery, treachery, and almost every other vice. Yet they possess a religion, dark and imperfect though it be, founded on the original bases of all faith; one great God dwelling above the clouds, a future state of bliss for the good—the happy hunting-ground of the American Indians—and a place of punishment for the wicked.

Their religion, however, did not teach them to avoid the shedding of blood. Until very recently, the Dyaks of Sarāwak indulged in the propensity of head-taking, which depopulated the land, interfered with the cultivation of the soil, and precluded the possibility of the different tribes living in amity one with another. The custom, however, has withered before the breath of European civilisation. No one now thinks of appropriating the heads of his neighbours, since Mr Brooke has declared that life for life shall be the law of Sarāwak, and has caused it to be felt that he will be obeyed.

Piracy, however, has always been the greatest bane of progress in the Indian islands. Mr Brooke has devoted himself with unwearied energy to assist in its suppression, and we hope soon to see the fruits of his labours. The first active affair of very great consequence related in the present work, is the triumph over a notorious piratical chief, one Budrudeen. To prevent unnecessary loss of life, it was resolved to seize him by stratagem. He had long ago, by innumerable atrocities, repeated in the very teeth of warning, forfeited the right of being treated as an honourable enemy. Brooke's ally 'arrived at Singè; I found the patinge (Mr Brooke's ally) waiting till the pangeran (Budrudeen) and the Illanun panglima (his partner in crime) came to the beach; and to prevent suspicion, my party kept close in the boat, whence I could observe what was passing without. The pangeran and Illanun walked down, both well armed, and the latter dressed out with a variety of charms. Once on the beach, retreat was impossible; for our people surrounded them, though without committing any hostile act. The suspicion of the two was, however, roused; and it was curious to

observe their different demeanour. The Borneo pangeran remained quiet, silent, and motionless—a child might have taken him; the Magindanas Illanun lashed himself to desperation. Flourishing his spear in one hand, and with the other on the handle of his sword, he defied those collected about him. He danced his war-dance on the sand; his face became deadly pale; his wild eyes glared; he was ready to die, but not to die alone. His time was come, for he was dangerous, and to catch him was impossible; and accordingly Patrigiali, walking past, leaped forward, and struck a spear through his back far between his shoulders, half a foot out at his breast. I had no idea that, after such a thrust, a man could even for a few instants exert himself; but the Illanun, after receiving his mortal wound, dashed forward with his spear, and thrust it at the breast of another man; but strength and life failed, and the weapon did not enter.'

Among the varied and novel matters contained in this volume, we have a history of Borneo, a description of all its known provinces, towns, rivers, and natural peculiarities; its various tribes, piratical and peaceful; the extent of its capabilities of producing articles of commerce; its gold, diamond, antimony, silver, and other mines; the manners, customs, religion, &c. of its people; and indeed a collection of useful and interesting facts, such as seldom come within the scope of one work. If our readers would learn all that is told in Mr Brooke's Journals, they must read them in their complete form. It is, however, wonderful that the English rajah could have devoted so much time to the collecting of information, multifarious and fatiguing as must have been his duties. Here is a slight sketch of his routine of daily life when at Sarāwak:—'My spare hours are devoted to the studying of languages, reading, and chart-making; and my companions are constantly employed—some stuffing animals and birds, others in teaching our young Bugis and Dyak youths their letters, and instructing them in copying my vocabularies. Nine is the breakfast hour; four the time for dinner; after which we stroll out till dark, and drink tea at eight. Of wine and grog we have none, and I believe we are all the better without it, retiring happily to our beds about ten, ready for that repose which will fit us for the labour of to-morrow. I have also been engaged in watching some of the head men amusing themselves at chess, which is a favourite game among them.'

But Mr Brooke has also his country-house, situated on the border of a beautiful river, rattling through a stony channel, and overhung with the boughs of magnificent trees, whose dark foliage, meeting at top, only admits a few subdued sun-rays, thus preserving coolness and shade on the waters even in the heat of a tropical day. On every side extends a sweep of richly-cultivated country, across which the stream meanders, its course marked now by a barrier of low rocks, and now by banks covered with extra-luxuriant vegetation. Santah Cottage stands on a moderately-lofty eminence on the river's edge. It consists of two storeys built with logs, entwined with split bamboo. A small farm of three acres lies behind it, which Mr Brooke has cleared of wood and jungle, and planted with a thousand nutmeg-trees, with some figs, to which he intends to add the coffee-tree and the betel nut.

Half a mile from this beautiful retreat another cottage is to be built, on a spot called the Fairy Knoll. Here a diamond mine is to be worked, the Santah river abounding in these precious stones. 'The diamonds are found mixed in the gravelly substratum, and there is likewise a small quantity of gold to be obtained. The earth is washed at the water's edge in large, round, wooden pans, shaped like shields; the diamonds are picked out, and there remains a residue of black sand like gunpowder and gold particles; of course a good deal of neatness and attention is requisite, and the workers seem jealous and superstitious, dialike noise, particularly laughter or merriment, as it is highly

offensive to the spirit who presides over the diamonds; and what is perhaps more important in their eyes, the diamonds cannot be found if the abode of quiet is disturbed by unholy mirth. It is surprising to see people calling themselves Mohammedans yielding to Pagan rites of presenting offerings to the spirit of the mine—the gnome king: fowls, rice, curi, are weekly offered; but I was pleased to hear that they are sensible enough to eat up these good things after they have been offered. Hajji Ibrahim, with a solemn face, requested me to give him an old letter, and he engraved thereon some Chinese characters two inches long, which, being translated, signify, "Rajah Muda Hassim, James Brooke, and Hajji Ibrahim, present their compliments to the spirit, and request his permission to work at the mine."

Such are Mr Brooke's rural residences, whither he retires when weary of the bustle and activity of his capital. His bungalow at Sarawak* is of a more imposing character. Built upon piles in the native style, and thatched with nipa, with a large veranda embracing the four sides, its interior yet presents all the characteristic comforts of an English dwelling. Landing at a little boat-house on the bank, you proceed up a broad gravelled walk, bordered by dense hedgerows of jessamine, to the porch; you then ascend a short flight of steps, cross the broad veranda, and enter a spacious saloon, or hall of reception, forty feet long. Adjoining this is a library, stocked with a choice assortment of the literature of various countries, and supplied also from time to time with the latest publications, periodical and others, on geographical and scientific subjects. Two bedrooms complete the interior arrangements of this curious mansion—half European and half Eastern. A kitchen, various offices, and bath-rooms, constitute detached buildings, at a very few yards' distance, while in close proximity stands a neat cottage, devoted to the purposes of hospitality.

Sarawak town is situated on the river of the same name, in a picturesque and fertile country. The native houses are built on either side of two beautiful reaches, while the Chinese occupy a distinct quarter on the right bank, opposite the English residences, which stand on eminences on the left.

The military defences of Sarawak consist of a fort or battery mounting six guns, and garrisoned by twenty-five Malay soldiers! This formidable detachment is quartered in barracks adjoining the fort. Each man receives six Spanish dollars per month, with a certain ration of provisions per diem.

With this imposing force Mr Brooke reigns over an extensive territory, whose capital contains a population of 14,000 inhabitants. This might not appear so extraordinary, were the people a meek, submissive, and domestic race, nurtured for generations in the lap of peace, and accustomed to the varied arts of industry. On the contrary, anarchy has been for ages the normal state of the country; strife, and consequent bloodshed, have unremittently urged on the work of depopulation; every man's hand has been against every man; destruction and pillage were the constant employments of the people; and no one knew or thought of peace. But a change has been wrought in the condition of affairs—a change which we should have considered incredible, had it been prophesied five years ago. What the next five years may bring forth it is impossible to foresee. If events, however, advance as steadily as they have done, and in the same direction, we hope to see a colony flourishing at Sarawak, factories in busy operation, steam-engines in full play, houses and streets built, and gardens laid out, and also an English church for those Europeans and natives who are inclined to attend it. This may or may not happen. The future is the future, and none may read it. If, however, any colony founded by an individual possessed of the requisite energy and ability ever flourished, Sarawak ought to

flourish. Mr Brooke, we feel assured, will prove true to the task he has undertaken, and we therefore entertain brilliant hopes of the onward progress of the English in Sarawak.

THE OPPOSITE HOUSE.

A DWELLER in one of the prettiest districts of suburban London, but often yearning for the freedom and retirement of the country, I yet endeavour, as the common saying runs, 'to make the best of things in general'—that is, by living as much apart as propriety will admit from the gossiping society usually found to preponderate in such places, and also by being intimately acquainted with all the hidden nooks, odd corners, and green dells within reach, where the early primrose and violets hide, and where the latest acorn drops.

The changes which have taken place in the 'opposite house' have often afforded me matter for contemplation during the past seven years, the more so, perhaps, because I visited there a long time ago, when, as an only and spoiled child, I was taken about everywhere with one who is now a saint in heaven; for which reason the memories and ideas thus associated assume with me somewhat of a sad and touching character.

The two elderly maiden sisters who were then the occupants I shall designate as the Misses Ramsay. They were rather aristocratic in their connections and pretensions; and it was considered something desirable to be admitted into the exclusive, but exquisitely dull circle, occasionally assembled in their prim drawing-room. I believe nothing save old friendship and family ties would have induced them to tolerate me in this model sanctuary, 'children and dogs' being especially prohibited, and objects of their supreme dread and aversion.

There was nothing I disliked so much as a visit to the Misses Ramsay; yet rather than be left out, or separated from my mother's side, I preferred encountering the heavy penance; and truth to tell, they were very kind in their way, fondly stroked my flowing curls as I sat on the huge foot-stool at their feet, while in gentle whispers they courteously hinted that I must be careful not to run up against the tiny tables, with their spider legs, on which rested the antique fairy cups and saucers of peerless china. Their establishment consisted of five domestics, all old retainers, and as precise and orderly as their ladies. First in importance, as major-domo of the establishment, came Benjamin the footman, a tall, gaunt man, with gray hairs, and a long solemn visage, who always appeared habited in an immaculate black suit, with silver shoe-buckles. A thoroughly respectable, though stern-looking domestic was Benjamin; and when, with staid and important demeanour, he came from beneath the porch (where bowing clematis and honeysuckle were kept within strict bounds) to unlock the little green gate through which alone visitors were admitted, wo to the careless individuals who failed to duly scrape and brush their shoes if polluted by contact with mother earth! The vinegar aspect became sourer and harsher, and unquestionable demonstrations of displeasure peculiar to himself, but well understood by those who knew him, evinced the wrath of the worthy Benjamin, and rendered it no pleasant matter to provoke it. The housemaid was his sister, and distinguished by the same undeviating severity of attire and bearing; though certainly, to judge from the neatness and shining cleanliness of the house (which, however, was far too neat and minutely arranged to afford an idea of use or comfort), she was the perfection of good housemaids, not to be had now-a-days for love or money.

The ladies each kept her own peculiar attendant—fac-similes of themselves. The cook of this clockwork establishment was of course invisible; and I never knew more than one person who had dined there, the entertainment being always limited to what is vulgarly termed 'tea and turn-out.' The dinner-hour was at

* For a representation and description of this place, see 'Views in the Indian Archipelago,' by James Augustus St John.

four o'clock to a moment; and our poor friend, who came from a distance, and was unavoidably asked to remain and partake of the repast, whispered to my mother, at our hospitable though far rougher board, 'that if dining off silver and porcelain was enough for satisfaction, there was a profusion of *that* at the Misses Ramsay's, and to spare; but in other respects it was a Barmecide's feast.'

Tea was handed round at seven precisely—visitors being never waited for. *Tea* did I say? it was an anomaly in the state of things—old maids being proverbially famed for their renovating hyson; but with the Misses Ramsay it was literally *wash*—never made in the room, but handed about to the guests on massive silver salvers, together with a very small portion of delicately-sliced bread and butter. I never dared to partake of the untempting beverage; for Benjamin and his worthy sister, Mrs Deborah, looked down so awfully upon me, that I usually felt paralysed, sat demurely still, and was thankful to be pronounced 'a well-behaved young lady now.' Little did our entertainers guess the outrageous romp I was privately contemplating for the next morning, as an indemnification for present thralldom.

A card-table was then put out, and a whist party formed, the remainder of the guests being left to their own discretion. At half-past nine enter Benjamin and Mrs Deborah again, with the silver salvers now supporting tiny but superbly-cut wine-glasses, each containing a drop or two of wine, while a golden basket held the small modicum of rich cake, divided into minute portions. By this time I was perfectly ravenous, not daring to cast my eyes on the tempting mouthfuls, but eagerly listening for the welcome announcement, at ten minutes to ten, of 'Your chair is waiting, madam.'

Yet strange to say, people always went to the Misses Ramsay's when they were asked; and one redeeming point there was—at all seasons, and at all times, a small but rare collection of the fairest and daintiest flowers shed their perfumed loveliness over the inhospitable stiffness of that cold drawing-room: their scent still haunts me with the associations of my childhood.

The Misses Ramsay gave large sums unostentatiously away in charities both public and private; and many poor of the neighbourhood had cause to lament their decease, which took place within a few months of each other, and a year or two previously to our being domiciled in our present residence.

How changed the outward aspect now of the 'opposite house'—even as changed as its hidden domesticity! A merchant, reputed to be prosperous, had taken the lease, and brought thither his wife, a lady of Swiss extraction, and a large family of children, of all ages, from twelve downwards.

These children were singularly beautiful, though formed on a large scale of robust healthfulness; their free springing step, agile frames, and well-proportioned figures, betokened pure mountain descent; while their fanciful costume (the talk and wonder of the amazed neighbourhood), as Swiss peasant boys and girls, with fancy-looking caps and gay streamers, bright jackets, laced bodice, and such short petticoats, &c. all combined to make the illusion so perfect, that, as I watched them sporting under the old trees, I often fancied a scene in some theatrical representation was before me. I had never entered the interior of the house since the days of my childhood, when the Misses Ramsay occupied it; but if the exterior was a true index as to its condition, report spoke truly when it said, that on the departure of the Swiss family it was found to be literally torn to pieces. The clematis and honeysuckle have never been visible again; all the flowers were trampled down; for the children's little carriages, drawn by pet goats, completed their destruction.

Carpenters appeared to be in constant requisition; broken chairs and tables were observed to be carried out for repairs; dilapidated blinds and smashed panes of glass afforded continual employment to glaziers and Venetian shade manufacturers. The foreign mother

appeared to be entirely devoted to the whims and caprices of her offspring, to the utter shutting out of all other human sympathies; indeed the scandal-mongers of the neighbourhood hinted, that had his home been better regulated, and more comfortably managed, the merchant would not so frequently have absented himself from it: hence disagreements arose; misfortunes in business came; and at length there was a total 'break up.' The elder children were sent by their English relatives to school, prior to their mother's returning to Switzerland with the younger ones, until arrangements could be made, or unanimity restored. The parting appeared to be a terrific one, and finished at the gate, and outside of it, as the carriage stood ready to convey the weeping children from the home they were never to return to again. The girls were dressed in plain English habiliments, and their close cottage-bonnets scarcely permitted the ruddy cheeks, now bedewed with tears, to be visible; the large hands clasped their frantic mother's neck, and the huge feet fondly lingered on that beloved threshold where so many happy memories twined around their young hearts. I never heard what became of them; but a kind of desolation appeared to reign on the final departure of the family.

The shut-up house, its ruinous condition, and its garden cloaked with weeds, rendered it a melancholy object from our windows; and we were heartily wishing that some eligible housekeeper would take a fancy to it, ere the winter set in, when one morning an array of bricklayers, painters, and paper-hangers made their appearance, and in a short time the 'opposite house' looked habitable once more; but still its general aspect was not cheerful, for the blinds were all sad-coloured, the paint was dark and dingy-looking, and the fore-court was entirely covered with gravel, all intruding branches being mercilessly lopped. A lady and gentleman in sad-coloured garments became the owners; and though, altogether, things looked as cold and prim as they did in the Misses Ramsay's time, yet they wanted a certain relief and elegance which reigned *then*, and which is not definable.

The gentleman was a dissenting minister, who, having a handsome private fortune, conducted his ministrations from a sense of duty. He and his wife were benevolence personified. They were never done admonishing, instructing, cheering; they fed the hungry, clothed the naked, and they were never known to make any difference in their charities on the score of religious distinction. A time came when these excellent persons also removed from the 'opposite house,' much to the grief of the neighbourhood. They emigrated to New Zealand, possibly for the sake of labouring in a wider field of usefulness—carrying tidings of the blessed Gospel to scenes of heathen barbarism. If such really were their object, what an example of self-devotion! I wonder if their thoughts ever revert to the neat English cottage, with its suburban accessories!

Once again the 'opposite house' was inhabited, and this time by a perfect colony of busy bees. A rich and pious lady of the vicinity purchased it for her charity school; and thirty orphan girls, in their pretty uniforms, here found a refuge from the present ills of life, and help and instruction to enable them to combat with those in store for their maturer years. Buoy, clean, and happy creatures they appeared to be; and though it was pronounced, by many of the neighbours, to be shameful and impertinent of Lady M.—to put so genteel a cottage villa to such an unseemly use, yet there were some who deemed it far otherwise. The school-room was that which had formerly been the Misses Ramsay's drawing-room. Poor ladies! how impossible it would have been for them to have imagined that no less than thirty of their forbidden torments, in the guise of robust charity girls, would one day be daily assembled there—that battledoors and skipping-ropes would usurp the place of the delicate embroidery frame—while numberless torn and well-thumbed spelling-

books, and 'readings-made-easy,' would take the place of 'Harvey's Meditations' and 'Blair's Sermons,' in their richly-embossed morocco covers and untarnished gilt-edged brightness. For not quite twelve months did the orphan girls enjoy their pleasant home. Lady M— died suddenly, the school was broken up, and the house has been empty for more than a year.

Such are the chances and changes I have witnessed, up to the present moment, in the 'opposite house.' But all of us have opposite houses, in whose stones we may read sermons if we choose—and sometimes romances; for human nature, when properly viewed, is never uninteresting or uninteresting. Mere empty curiosity, no doubt, is either hateful or absurd; but it is good, for all that, to turn away sometimes from the interior of our hearts and homes, and inquire, in a kindly yet observant spirit, into what is going on in the 'opposite house.'

THE PRECIOUS METALS.

MONEY, in some form or other, has in all time been so intimately associated with the business and pleasure of the world, with the public and private policy of nations and of individuals, as to have engaged the attention of philosophers and legislators, poets and philanthropists, as well as the votaries of the giddy goddess who regard it merely as the vehicle of enjoyment. Whatever the material of which the circulating medium is composed, its potency has varied but little, if at all, from the universal standard. Some people have considered that there was 'nothing like leather,' and impressed a stamp upon bits of hide; others have declared in favour of iron, brass, bronze; in short, all the metals, as they were known, have been legitimatised into currency. In some countries yet unvisited by the schoolmaster, we are told that the natives use bullocks instead of bank-notes, with sheep by way of small change; others, again, recognise only lumps of salt, or shells. Still, as before observed, whatever the material, the conventional currency appears to be everywhere pretty much the same as among our day-book and ledger communities:

'The only power
That all mankind falls down before;
Money, that like the swords of kings,
Is the last reason of all things.'

By common consent of all nations who have been able to obtain the precious metals, gold and silver have superseded all other materials of currency—always excepting paper. These occupy so small a space, admitting of being conveniently hoarded and preserved, as to have commended themselves especially to popular instinct in remote and unsettled ages. At the time of the conquest of Persia by the Greeks, the gold accumulated by successive monarchs of that country amounted to about L.80,000,000 sterling. The whole or greater portion of this large sum was transferred to Greece by the victories of Alexander, besides which there were several mines of gold and silver within the Grecian territory. The influx of such enormous wealth would necessarily tell on the manners of the people, and on prices; and accordingly, in the days of Demosthenes, gold and silver were five times less valuable than under Solon. Whatever be the amount circulating in a country, there is a constant tendency towards diminution; the immense accumulations would be widely scattered in foreign wars or intestine convulsions. How great must have been the dispersion of precious metals on the downfall of Rome, and afterwards of Byzantium! From the date of the latter event, down through the middle ages, and even to the present century, large sums have been totally lost, from the practice of burying money for safe keeping, as in many instances the owners died, and carried the secret with them to the tomb. When to these causes is added the loss by shipwreck, and other casualties, the result appears in the magnitude of the diminution. Just before the discovery of America, gold

was at an enormous value, but subject to great and frequent fluctuations.

The amount of coined money circulating in the whole of Europe at the close of the fifteenth century has been estimated at L.34,000,000 sterling. The quantity coined in England in 237 years ending in 1509, was equal to nearly L.7000 annually, present value; but from 1603 to 1829, the average was L.819,415, or 122 times greater than before the supply from the mines of the new world. In addition to the causes of diminution above described, there is the mechanical wear of the money in passing from hand to hand. This loss has been variously estimated: according to Mr McCulloch, it is 1 per cent. per annum. If this be correct, L.40,000,000 coined at the beginning of a century, would be reduced to L.15,000,000 at the end; in two centuries, L.6,000,000 would remain; and in five centuries, about L.300,000 only. Taking Mr Jacob's estimate of the annual wear at 1-360th part, what was L.200,000,000 under Constantine, would be reduced to L.12,000,000 in the time of Edward I.

The discovery of the mines of Potosi, above all other acquisitions made by Europeans in South America, effected an important change in the commercial relations of the old world. Purchasers found it necessary to go to market with more and more money in their hand, such was the progressive increase of prices. To many persons the rise was a source of exultation, but the greater part regarded it with suspicion and discontent: they could not understand why wheat should be doubled, and in some instances quadrupled, in price in the course of a few years. The dissatisfaction was not confined to the poorer classes—it excited attention in higher quarters; and Latimer, in one of his sermons preached before Edward VI. and the court, animadverted upon the change in no very mild terms. In reality, mankind were benefited, not injured, by having more gold than they had before, just as they would be benefited by an increase in the amount of their wardrobes, or growing timber, or any other tangible possession.

The present importations of silver into Europe are about 40 to 1 compared to those of gold. According to all the accounts, we are to see greater changes in the course of a few years, from the influx of the precious metals, than any that have yet been produced. The application of European science and industry to the exploration of the hitherto imperfectly-worked mines of the South American States, will doubtless effect some notable difference in the proceeds. In those countries, wheelbarrows and vehicles for transport are scarcely known, and in most cases mule tracks are the only roads. The workmen generally employed in mining operations possess no other tools or machinery than their ten fingers, a lasso, and a knife. The loss and waste consequent upon such a state of things may be easily imagined. Mercury, as is well known, is an essential element in amalgamations of gold and silver, and in their separation from the ore; the quantity annually required for these purposes by the American mines is about 3,000,000 of pounds. Of this the greater portion is imported; and its transmission into the interior of the country is in the hands of monopolists, by whom the price is raised to so excessive an amount, as to leave but little room for profit to the miner. Various attempts have from time to time been made to effect the operations in which mercury is employed by other methods: at Freyberg, in Saxony, the amalgamation is accomplished in revolving cylinders, which complete the process in fewer hours than the days consumed in the operation in Mexico and Peru, with a much smaller consumption of the quicksilver. In Europe, mercury is used to recombine the silver after its separation from the ore, while the American miners employ it to effect the separation.

Recent and present researches in electro-chemistry render it certain that before long this resistless agency will supersede the use of quicksilver in the working of metals: its power over the elements of the most intimate combinations of metallic and other bodies is

well known. The experiments of M. Bœquerel in this branch of science have as yet been the most successful, and although not so effective as is to be desired, they have acquired an industrial character. Some of the experiments undertaken in Paris were tried upon nearly 10,000 pounds of silver ore from Mexico, and with a favourable result. A method of amalgamation has also been discovered, by means of which five-sixths of the mercury now considered essential to the process will be saved. About forty ounces of silver are obtained from 1000 pounds of ore; the pulverisation or trituration of the latter is effected in South America by the feet of men and mules, instead of water or other power. Human skill, in fact, seems to be deficient in proportion to the riches of nature. A machine somewhat similar to a mortar-crusher was introduced at Potosi to supply the place of animal labour by a European. With this instrument, one man and a mule, costing five shillings per day, could do as much work as twenty Indians, for whom the charge was three pounds. Although this machine was constructed more than twelve years ago, not one of the labourers or workmen employed at the mines has attempted to imitate it: they leave the owner in undisturbed possession of his advantage, and plod on in their old way. This fact alone will suffice to show the waste of capabilities in the search for metals, and the increased return that may be looked for under a more efficient system of management. The conquest of Mexico by the people of the United States may be regarded as a preliminary step in the development of those hitherto neglected resources. With their restless enterprising spirit, roads, canals, and railways will soon be constructed, and the mining returns will reach their maximum.

Baron Humboldt has expressed himself in most positive terms on the subject of the future production of the precious metals. Confining himself to the Mexican states alone, he says—'When we consider the vast extent of surface occupied by the Cordilleras, and the immense number of mineral deposits which have not yet been attacked, we shall understand that New Spain, when better governed, and inhabited by an industrious population, will yield for her own share the seven millions now furnished by the whole of America. In the space of one hundred years, the annual produce of the Mexican mines was raised from 1,000,000 to nearly 5,000,000 of pounds.' In another place he writes—'Europe would be inundated with precious metals if simultaneous labours were commenced, with all the improvements in mining machinery, upon the deposits at Balanos, Batopilas, Sombrerete, Rosario, Pachuca, Sultepec, Chihuahua, and many others long and justly celebrated. . . . There is no doubt that the produce of the mines of Mexico might be doubled or tripled in the space of a century. . . . In general, the abundance of silver is such in the chain of the Andes, that taking into consideration the beds yet left intact, or which have been but superficially worked, we should be tempted to believe that Europeans have scarcely begun to comprehend the inexhaustible fund of riches shut up in the new world.' With the proverbial celerity of the United States' population, much of the work here calculated for one hundred years is likely to be achieved in a quarter of that time: the effect on rates of exchange and prices all over the world will be very remarkable. Silver, it is calculated, will be reduced at least one-half in value; and those countries in which the greatest amount of this metal is in circulation will be most exposed to loss. The silver coin circulating in Europe is commonly estimated at £320,000,000, of which France holds three-eighths: according to some authorities, the contingency to be provided for is only a question of time.

'A phenomenon will be exhibited similar to that which complicated prices and transformed so many social positions three centuries ago. The crisis, however, will be much less rapid and less violent; because the mass of silver already acquired by the old continent being

enormous, the influence of even a considerable quantity thrown into the market will make itself felt more slowly. The level between different centres of commerce is more easily established than formerly; a glut upon one isolated point is therefore little to be feared. After some time, the value of silver would be regulated everywhere by the cost price; and if the expenses of production are reduced one half, any country at present in possession of a currency worth £30,000,000, would be the poorer to the amount of £15,000,000, since the quantity of labour and of profit which a shilling would then represent would be diminished by one half.'

Mines of gold and silver are, however, not exclusively confined to America: with the exception of England, there are several in nearly every other country of Europe, and the return from some of these is increasing every year, a cause which will naturally accelerate the effects contemplated. An accurate annual statement is published of the produce of the mines of Russia. In that empire, the metalliferous deposits extend over a region stretching from Kamchatka to Peru—one half of the earth's circle in length, with an average breadth of 8 degrees of latitude. The presence of gold under this portion of the world's surface was early known, and recorded by Herodotus, but was subsequently lost sight of for two thousand years. In 1774, the re-discovery of auriferous sand was made during some repairs to the machinery at the Klutchefsk mines; further discoveries followed, and in 1823, the present system of working was commenced. The richest deposits are found in the Ural and Altai mountains: in 1836, the produce of gold was 13,000 pounds weight; in 1845, it had increased to 45,000 pounds; and as far as ascertained, the returns for 1846 were still augmenting. The gold furnished by Russia is to that of America as 144 to 100. 'So great is the quantity of gold at present existing among civilised nations, that an annual addition of 45,000 pounds would not for a long time cause any sensible difference.'

For some of the facts and conclusions in the foregoing paper, we are indebted to an elaborate article on the subject in the '*Revue des Deux Mondes*,' by M. Chevalier.

NIMROD.*

A DRAMATIC poem entitled 'Nimrod' has been exciting some attention; but it is no easy matter for critic or common reader to give any account of it. The reason is, that 'Nimrod' is difficult to read, and the age of earnest laborious readers has gone by. When the men of the present day meet such a work, they peep at it. The critic may write 'a notice;' but it is such notice as a gentleman gives in passing to his unpaid tailor.

The reason why 'Nimrod' is difficult to read is, that its author's unquestionable power is unguided by tact. There are materials in the volume for a good, perhaps a great poem; but these are thrown together into a formless, inartificial heap, which shocks the tasteful, and appals the timid reader. The Greek tragedy, the mediæval mystery, and the melodrama of these last days, all contribute something to the plan, which is therefore alike unsatisfactory to the classical and romantic reader.

Still, even taken as a whole, there is something grand and majestic in the idea of 'Nimrod.' The hero, from a slayer of wild beasts, becomes, in quick gradation, a soldier—a conqueror—a king—the master of the world, and the adopted son of the god Baal. His love for the humble Nahmah lives throughout his exaltation, and he despatches envoys to bring her to be the companion of his throne, binding himself by an irrevocable oath to grant any request she may make. The pious, however, desire to convert the demigod into their tool, and contrive that Nimrod shall appear guilty of impious

* Nimrod, a Dramatic Poem. London: William Pickering, 1846.

neglect of his parents; and when Nahmah betakes herself to his capital, it is with a willing step but a foreboding heart. The prophecies of her spirit are realised. The priests, who have already brought about the death of his parents, have bound him in a tremendous vow to give what he prizes most to Baal; and Nahmah, exacting the equally binding promise he had made to her, acquires the right of perishing on the funeral pile, a sacrifice for her beloved. Such is the really fine conception of a poem the greatest want of which is—a little ordinary tact.

With regard to the execution, a favourable idea will be formed of it from the following dream of Nahmah:—

—— ‘Methought I stood

Waiting for Nimrod; the slow sinking sun
Made golden pillow of the glowing sword
Whereon his slant beams rested. Sudden a change—
The beams were gone, and yet there was no shade—
No light, and yet all visible. I raised
My wondering eyes, and, mother, there ‘mid cloud
Hiding the darkened west, yet glittering
With some dread foreign splendour, all unknown
To our mild rainbow’s tints, a woman stood:
I see her now—even now, with her white hands
Crossed, pressed upon a bosom which despair
Had made an aching void; her features wan,
As moonbeams on new snow, and fixed and sad.
Her gaze pierced through even to the inner soul,
Where thought in thought makes being, and finds there
Its essence—mingling there with thought and self—
Till she grew part of me, as I of her,
Our past, our present, knowing, sharing all:
I felt she loved and she despaired, yet clung
To love and peace refused; though endless were
The love despairing. Mother, I then was taught
Such love may linger through an endless woe,
Yet no repenting weakness e’er disturb
The calmness of the grief which love endears.’

A fine idea on a hackneyed subject:—

‘I know now whence it comes—yes, there is hope—
Not in this false and mocking world, not here,
But in hereafter—hope—ay, even for him:
The rainbow arches o’er all men alike,
But they alone who raise their swelling eyes
Feast on its wondrous beauty.’

The following is the death of the mother, struck down by the insulting neglect of the son on whom she had doted:—

—— ‘As Admah heard these bitter words,

She veiled with shivering hands her burning eyes;
Then fell the helpless hands back to her side,
One look intense at thee—but none at him:
The father outraged by unnatural son
The mother feared to gaze on; then erect,
Unbending, with a queenly step, as if
A towering port alone could bear the weight
Of grief, which else had crushed her to the earth,
She passed away. I followed, yet dared not
Approach that awful image of lone woe,
Till at yon height from whence the torrent comes,
Mad, eager rushing with a wild delight
To dash and churn itself among the rocks,
She stood—one long gaze gave the south—then, turning
To this dear home, she shuddered—raised her eyes
To the blue heaven (a lark was singing there,
With joyous trill piercing the water’s roar),
And tottering fell: it might be chance, not purpose,
But the fierce waters with an added shout
Closed round her shrieking not: all help was vain—
And I am here the miserable tale
To tell; more woe to heap on utmost woe.’

This is sufficient to show, that even setting aside the general conception, which we have shown to be fine, there is matter in this volume to repay the adventurous reader.

GOVERNESSES’ BENEVOLENT INSTITUTION.

In a former paper we described the nature of the benevolent institution which has been formed, and some time in operation, in London; and we again refer to the subject, for the purpose of mentioning that it is now proposed to add to the institution an Aylm or Permanent Home for Aged Governesses. The directors appear to be encouraged to carry out this object by the success which has attended the other departments of the establishment. Already there is a Provident Fund, by paying into which ladies

connected with education may secure annuities; and also an Annuity Fund, from which aged governesses in depressed circumstances may, by election, obtain annuities of small amount. It is distressing to read of the applications for the benefit of this fund. At the last election there were eighty-four candidates for three annuities of £15 each—‘Eighty-four ladies,’ says the Report before us, ‘many reared in affluence, and all accustomed to the comforts and luxuries of at least our middle ranks, seeking an annuity of £15! Of these, seventy were unmarried, and out of this number seven had incomes above £20—two derived from public institutions; sixteen had incomes varying from £1, 16s. to £14; and forty-seven had absolutely nothing! It will be recollected that all these ladies are above fifty years of age; and of the utterly destitute, eighteen were above sixty. It is sometimes asked, Could they not have averted this lamentable condition? The committee would fain hope that all who have received a polling-paper have read the cases to which they refer, to see that out of these seventy ladies no less than fifty-four had not provided for themselves, because they had devoted their salaries or their savings, legacies from relations, and all their earnings, more or less to their families; from the “support of one or both parents for many years,” to the educating younger sisters, helping brothers in their onward path, and protecting and educating orphan nephews and nieces.’

It is impossible to peruse this melancholy record without turning round on those to whose negligence and selfishness, in the first instance, governesses too frequently owe their destitution. With every proper allowance for the misfortunes which prevent parents from making provision for their daughters, we must speak emphatically of the injustice and cruelty of rearing them in affluence, and afterwards leaving them to struggle with the stern realities of the world. It would be interesting and useful to know in what condition the parents of the above eighty-four governesses lived, and whether it was absolutely beyond their power, at any time, to provide, by life-assurance, against utter destitution. In the present, as in many similar appeals, we fear that heedlessness, and some degree of selfishness, were concerned; and that to the public is left the performance of duties which it ought to have been the joy of private parties to fulfil. Be this, however, as it may, compassion cannot leave the unfortunate to perish. The efforts, therefore, now making to provide a home for poor and aged governesses, whose cases merit consideration, have our hearty commendation; and we unite with Mrs S. C. Hall—the friend of the friendless—in her eloquent appeal to the charitably-disposed in a late number of the ‘Art Union.’ ‘Are we to suffer those ladies, who, from the poverty of pocket, or poverty of mind of their employers, or from circumstances over which they have no control—who have laboured so honourably and so profitably for us—to find their last resting-place in a lonely garret, or the still more wretched workhouse? We appeal to mothers of families to look back to their own early days, and in reverence to those who taught them, who had patience with them, who made them what they are, to aid us in the erection of a shelter for aged governesses; we appeal to the young to devote their spare time, between this and May, in employments for them, so that if they have not money to bestow, their labour may be converted into money at the bazaar which is to be held early in June on behalf of this great object.’

The bazaar here alluded to is, we understand, to be a species of fancy fair, to be held in the Royal Hospital Grounds, Chelsea, in the first week in June. For every £150 realised by sale or donation, apartments will be found for two aged governesses.

HOW TO ACT IN A MOB.

A mob is a riotous assemblage of persons. Every individual, therefore, who remains in the neighbourhood of it, even from curiosity, helps to constitute that mob. Every one who goes away helps to dissipate it. If, therefore, you are a good citizen, and find yourself in the neighbourhood of persons destroying property, or acting riotously, you should at once range yourself on the side of those who are appointed to keep the peace; or, if there be none at hand, immediately get away from such dangerous and disreputable companions. If you do not, remember that, as a mob is made up of individuals, every respectable person who remains in it helps to encourage the disturbers of the

peace, and to discourage, as far as numbers is concerned, those who are bound to maintain it. The civil and military authorities cannot well discriminate idle onlookers in a mob from more guilty promoters. They are opposed by a riotous assemblage, which it is their duty to disperse; and if you will remain in bad company, you must take the consequences. To stand at the entry of narrow streets and closes is also dangerous. The civil and military authorities are frequently assaulted from such places, which they regard with jealousy, and for their own safety are obliged to clear them. In a free country like this, where the greatest possible liberty is given to the press, and where the right of peaceably meeting to petition our rulers on any subject is fully secured to the poor, all riotous assemblages are without excuse, and must, and will be put down by the lawful authorities, aided by all good citizens. In a sentence, then, the way to act in a mob is, to range yourself on the side of the peace authorities, or at least to get out of the company of riotous persons without delay.—*Industrial Magazine*. [We are glad of an opportunity of enforcing these useful and proper advices, and of deprecating the too common practice of swelling the numbers in a mob from motives of idle and silly curiosity.—*Ed. C. E. J.*]

INJUDICIOUS PATRONAGE.

It is very well to encourage young artists and young poets, provided that the encouragement be judiciously and temperately rendered; but knowingly to raise hopes which can never be realised is, at the best, wanton mockery. To extol beyond reason is often, in effect, to weaken the motives for improvement. How frequently are men spoiled by a false estimation of their own abilities! We could point out instances in the present day of persons refusing to work because they have been dubbed poets; we have known men who would never handle the hoe, nor wield the hammer, nor throw the shuttle, because they could spin rhymes; and we have seen the hand that could pen a sonnet withheld in contempt from the recording of a transaction in business. These individuals revile the world for troubles which they bring upon themselves; and their own drivelling conduct entirely hinders their advancement. They are not alone to blame for their unfortunate position; for they have each in turn been injured by adulation. To versify with facility is an elegant accomplishment; to try to be a true poet is a noble ambition; but the sweetest songs, and the loftiest imaginings, are not incompatible with hard work performed by either hands or brains. As a recreation, literature adds grace and dignity to honest, independent industry; and as a profession, it offers a career which may be successfully pursued by those who have the requisite intellectual aptitude and untiring perseverance. But to make the love of literature a pretext for eating the bread of idleness, is a moral wrong, which deserves unsparing censure.—*Sheffield and Rotherham Independent*.

PEDLARS AND POETS.

How vastly more strange and extravagant-looking truth is than fiction! Our Edinburgh reviewers deemed it one of the gravest among the many grave offences of Wordsworth, that he should have made the hero of the 'Excursion' a pedlar. 'What,' they ask, 'but the most wretched and provoking perversity of taste and judgment could induce any one to place his chosen advocate of wisdom and virtue in so absurd and fantastic a condition? Did Mr Wordsworth really imagine that his favourite doctrines were likely to gain anything in point of effect or authority by being put into the mouth of a person accustomed to higgly about tape or brass sleeve-buttons? Or is it not plain that, independent of the ridicule and disgust which such a personification must give to many of his readers, its adoption exposes his work throughout to the charge of revolting incongruity, and utter disregard of probability or nature?' If the critics be thus severe on the mere choice of so humble a hero, what would they not have said had the poet ventured to represent his pedlar not only as a wise and meditative man, but also as an accomplished writer, and a successful cultivator of natural science—the author of a great national work, eloquent as that of Buffon, and incomparably more true in its facts and observations? Nay, what would they have said if, rising to the extreme of extravagance, he had ventured to relate that the pedlar, having left the magnificent work unfinished at his death, an accomplished prince—the nephew of by far the most great monarch of modern times—took it up, and com-

pleted it in a volume, bearing honourable reference and testimony, in almost every page, to the ability and singular faithfulness of his humbler predecessor, the 'Wanderer.' And yet this strange story, so full of 'revolting incongruity and utter disregard of probability or nature,' would be exactly that of the Paisley pedlar, Alexander Wilson, the author of the 'American Ornithology'—a work completed by a fervent admirer of the pedlar's genius, Prince Charles Lucien Bonaparte.—*Bass Rock*.

DANCING AS AN EXERCISE.

A few words may be offered in this place in favour of dancing as an exercise, and as a school-room recreation. Exercising so many muscles otherwise little used—exercising them fully and duly, and without violence—exercising them to the cheering influence of music—exercising them in forms of grace and beauty—dancing may be made an important and valuable part of the physical education, and as such should be spoken of, and promoted by, the powerful voice of the medical public. The balanced action of the opposing muscles, the active use of the different articulations, the extensive and varied action of the spinal muscles, effected by dancing, and the degree to which the mental excitement produced by it enables the exercise to be made use of without undue fatigue, are strong reasons for so decided and favourable an opinion; and this, without obtrusive interference with opinions as to the propriety, or otherwise, of carrying the practice of dancing to an excess in the after-life, and making it the plea for late hours, &c. Let people think as they will of public balls, or even of private balls; with the conscientious opinions of others it is not my wish, nor intention, to interfere; but to dancing in the school-room, or among the members of the family circle, few will object; and it is not too much to say that if dancing could be made a daily, not nightly, exercise among the people of all classes, the healthiness and the expectation of life, as well as its happiness, would be increased.—*Robertson on Diet and Regimen*.

RAILWAYS.

The following table relative to the capital invested in railways is peculiarly interesting at the present period:—

	Capital and Loans Authorised.
1. Railways sanctioned during twenty years, from 1836 to 1845 inclusive, comprehending stock and loans authorised according to Mr Ker Porter's table. (See 'Progress of the Nation,' last edition, p. 332).	L.153,435,837
2. Railways begun or projected under acts passed in 1846 (272 acts), per parliamentary return of stock and loans authorised.	132,617,368
3. Ditto ditto under acts passed in 1847 (18 acts), stock and loans, enumerated in 'Companion to the Almanac' for 1848, p. 42, et seq., just published.	35,063,234
	L.321,126,529

These enormous sums exceed by *threefold* the amount of foreign loans and joint-stock bubbles which in 1826 brought the commercial and landed interest of this empire to the brink of ruin; and the railway projects for the last two years exceed our national expenditure in the years of Leipzig and Waterloo.

CHAMBERS'S EDUCATIONAL COURSE.

To this series of books, which now approaches its completion, has just been added the *HISTORY OF ROME*, in one volume, illustrated with a map of the Roman empire, price 2s. 6d. In the preparation of this work, advantage has been taken of all the lights recently thrown on the subject by Niebuhr, Arnold, Michelet, and others; while it has been a special object of the writer to present the narrative in that intelligible and attractive form desirable for interesting the minds of youth.

The work is sold by all booksellers.

* * * At the Depot of W. and R. CHAMBERS'S Publications, 147 Strand, London, may be seen or procured all the works in the EDUCATIONAL COURSE.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. & ONS, 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 226. NEW SERIES.

SATURDAY, APRIL 29, 1848.

PRICE 1½d.

THE NEW LAIRD OF BALDRIDDLE.

A few years ago, a lounge in the Outer-House—as our Scotch Westminster Hall is termed—might have heard, booming above the general din, the sonorous cry of 'Miss Peney Glendinning *versus* the Laird of Baldriddle,' at which certain gentlemen in gowns and wigs might have been seen hurrying away to attend 'a hearing' in an adjoining court-room. It is certainly, as Peter Peebles observed, a very grand thing to have a law-plea, but occasionally it is more grand than profitable; and in these degenerate days, when a shilling is looked at on both sides before it is parted with, people may be heard pensively and candidly confessing 'that they would put up with a good deal before they went to law'—the whole thing of course being looked upon very properly as a game of chance, all statutory enactments to the contrary notwithstanding.

Our old friend Miss Peney Glendinning was pretty much of this mind when, by a conjuncture of circumstances, she hauled her landlord before the Court of Session—a step, be it known, she did not adopt till she had been hauled up by the said landlord in the first instance; so that it was a kind of litigation vindictory in which she found herself engaged—an account per contra opened in favour of herself, and chargeable with interest to the Laird of Baldriddle. How Peney sped in this affair is now our business to relate.

Peney Glendinning, it will be remembered by the reader of these pages, was a rustic heroine; a farmer on her own account, who, by extraordinary energy of character, and unceasing industry, reclaimed a wretched piece of land in one of the northern counties of Scotland, and made it bloom like a garden—vastly to her own advantage. Peney's history we had thought was concluded when we dropped it,* but a new incident was added in the form of her law-plea, and without a proper notice of this, her biography would necessarily be incomplete. But how, in the name of wonder, did Peney provoke this stirring incident; for she was a miracle of sound sense, and desired to live at peace with all, her landlord included? Thereby hangs a tale.

It is very true that Peney lived at peace with her landlord, paid her rent regularly, and fulfilled all her other territorial obligations: but this was her first landlord—old Cacanny of Baldriddle, a worthy, decent man, who would not have harmed a fly, whose word was his bond, and who in all things did as he would be done by. It was sad news to Peney and the other tenants when old Cacanny found it necessary to dispose of the Baldriddle estate, and retire to a distant part of the country. It was acknowledged to be the

greatest loss the district had sustained for many a day. What the precise calamity was which brought the Cacanny family, in which the property had been for a hundred years, to this lamentable crisis, is of little consequence. Landlords are exposed to a number of vicissitudes. They are liable to build and improve themselves out of house and home. From spending over-much, and taking matters too easily, they occasionally have to sell all, or at least go under trust. Making a provision for daughters is another serious affair, which sometimes ends badly; though it is not generally half so bad as buying commissions for sons in the army, and paying their debts to keep them out of prison. What heart-rending tales could be told of sons—brilliant, dashing dogs!—ruining fathers, and getting them turned out of their ancestral domains!

In whichever way the thing happened, old Cacanny was obliged to part with Baldriddle, and a terrible parting it was. For a week previous to departure, he sat in an old arm-chair—the domestic throne of three generations—sunk in a stupor of grief; and not till in some measure soothed and exhilarated by the pious counsels of the clergyman of the parish, could he be persuaded to put his foot in the postchaise which was to drive him for ever from the halls of Baldriddle.

It was known that Baldriddle was sold; but nobody knew anything of the new laird, and his coming to the country was looked forward to with a reasonable degree of interest. The gentry wondered whether he would reside amongst them, and give dinners; the farmers wondered if he would turn out an exhibitor at agricultural shows; and the shopkeepers of the neighbouring town wondered whether he would encourage local trade, or import his groceries from the metropolis. One thing seemed of doubtful portent: his name, M'Cosh, sounded harshly, and indicated a plebeian origin. Besides, he had realised a fortune by commerce—a mode of getting rich which is not highly appreciated in rural districts. Yet M'Cosh was not a bad sort of man; he considered himself to be very sagacious, and had bought Baldriddle for two special reasons: first, because it was a good investment. Everybody declared it went far beyond its price when it was knocked down at Fraser's sale-rooms for £74,000. But Mr M'Cosh knew perfectly well what he was about. The property was improvable in the way of rent. This, however, was not the sole consideration. On the estate there were fourteen tenants, with *bonâ fide* votes, every one of which, as a matter of course, could be counted on. There could, besides, be fixed on the estate forty-five fictitious, yet valid claims—making altogether fifty-nine votes at the beck of the Laird of Baldriddle in the event of a county election. With such a weight of influence—the just and sacred influence of property—if Andrew M'Cosh could not screw places out of government for

* See Journal, No. 565, old series.

all his kith and kin, he would allow himself to be called ass.

So much as regards one reason for purchasing Bald-
riddle at so high a figure. Another, somewhat less
substantial, yet by no means illusory, was the sound
of the name. In Scotland, a man is usually called by
the name of his estate; and a purchaser therefore does
not like to saddle himself with the horrible appellation
for the remainder of his existence. 'How do you do,
Drunkie?'—Could anybody stand that? 'Skreigh, I'll
trouble you to hand me a leg of that fowl!'—Worse and
worse! 'I beg leave to propose the health of Glen-
yeukie!'—The thing is too ridiculous! M'Cosh, like a
wise man, thought over all this. He had been diligently
watching the advertisements of estates for several years,
with the view of snapping up the first that came into
the market of a proper size, and which had a finely-
sounding title.

'Baldriddle—Baldriddle! that will do,' said M'Cosh
to himself on looking over the North British Adver-
tiser one day in the Glasgow Exchange. 'Andrew
M'Cosh of Baldriddle, Esq. Yes, that will do. The
name is ancient. Bal is Celtic for town. I see how it is;
the town or seat on the Driddle—a fine trouting river
I daresay. And so many recommendations besides:—
"Vast extent of dry hill pasture—shooting over ten
thousand acres—grouse, blackcock, and deer—highly-
improvable rent-roll—can command nearly sixty votes
for the county—fine old mansion-house—genteel neigh-
bourhood—mail-coach passes the lodge daily," &c. Ad-
mirable! Baldriddle is mine: I would not lose it for
the world.' And true enough M'Cosh purchased Bald-
riddle, as we have intimated, for £74,000, cash down.
On the evening following the acquisition, what a
carouse at Carrick's to congratulate the new Laird of
Baldriddle!

But we must hurry through our preliminaries. The
delight of Mrs M'Cosh and the three Misses M'Cosh on
quitting the amenities of the Cowcaddens, and their
still greater delight in telling everybody they were
going to their country seat, need not be particularised.
It is enough to say that the family reached, and were
installed in, their new mansion without losing their
senses; that the neighbourhood—the scenery of the
Driddle—was pronounced charming; and that the view
from the drawing-room window was declared to be very
much superior in every way to any prospect on the
Saughieha road.

When all things were settled, and the new laird had
got his business-room in order, he began to look about
him. The time was come for seeing how the rent-roll
could be improved. 'No doubt things had been left in a
confused and backward state by that stupid, well-mean-
ing idiot, old Cacanny. But I shall set them to rights.'

Inspired with these high hopes, Baldriddle made a
round of calls on his tenantry, and at length alighted
at the door of our heroine.

'Happy to see you, Mrs Glendinning. I have taken
the liberty of calling to ask for you, and make a few
inquiries about your farm.'

'I am much obliged to you for calling, sir, and beg
to wish you happiness in the property. Please to step
in and take some refreshment after your ride.'

'Thank you,' replied Baldriddle, entering the dwell-
ing; 'I would rather be excused eating anything at
present. My chief object in calling was to ask how
long you have been in the occupation of your farm.'

'I have a lease for nineteen years, and I am now in
the eighth year.'

'You mean seven years have run?'

'Yes.'

'And what is your yearly rent?'

'Two pounds an acre.'

Baldriddle knew this fact previously, but he affected
surprise.

'Two pounds an acre only; and such crops! I have
seen nothing like them north of the Carse of Gowrie.'

'I would be bauld to complain: the crops are no that
bad; but I should tell you that when I entered into pos-
session, the farm was little better than a wilderness, not
worth five shillings an acre. I have drained it, manured
it, sheltered it, and made it what it is.'

'That may be all true; and yet I think you have
too good a bargain of the farm. Would you show me
your lease?'

Peney candidly acknowledged that she had no formal
lease. Baldriddle then requested to see her minute of
lease, or missive; but neither had she anything of that
kind. All she possessed was a scrap of paper on which
old Cacanny had noted the proposed rent until the
lease could be extended.'

'Mrs Glendinning, I am very sorry, but this will not
do. You have positively no lease; you are a tenant
at will.'

In vain Peney remonstrated against this cruel su-
pposition. She said she could easily get a certificate
from the late landlord avowing the nature of the
lease.'

'That would serve nothing,' said Baldriddle; 'the
former proprietor is what the lawyers call *functus*: he
is no longer clothed with any authority in the matter.'

'Weel, weel,' replied Peney; 'functus here, functus
there, a' I ken about it, is that I will maintain my rights
if there be justice in Britain.'

The new laird withdrew. War had been as good as
declared between the parties.

'A pretty thing truly,' said Baldriddle to himself as
he rode home; 'a pretty thing that this jade should do
me out of a pound an acre per annum. The land is
worth three pounds if it's worth a farthing. And now
that I think on't, she is not a voter. This comes of
having female tenants. I must get rid of her, and so
not only raise the rent, but make up the voters on the
estate to the neat sixty.'

Animated with these brilliant ideas, Baldriddle sent a
letter to Peney next morning to intimate that she
would require to vacate at Martinmas.

The blood went and came repeatedly in Peney's face
as she read and reflected upon this document; and
though she sat down to breakfast as usual, she cer-
tainly did not breakfast that day. She could only read
and re-read that letter. With her usual good sense and
decision, she resolved, as a first measure, to see some
professional man; and of all men, she thought the
likeliest to serve her would be an old friend, Sandy
M'Turk. Dressing herself, therefore, as for an ordi-
nary journey—that is to say, in silence, and with all
the composure she could assume—she had her currier
brought to the door, and set out to visit this rural
attorney. She fortunately found him at home, scrawl-
ing away at a great rate, a sheriff's officer being closeted
with him, and two concurrents at the door. Having
dismissed them, and for some time exercised the re-
mainder of a poker in clearing the ribs of a diminutive
grate, as if to get time to clear up his own thoughts at
the same time, he said, 'Now, ma'am, what may be
your commands?'

Peney told her story, apologising with great humility
for her excessive stupidity in not having obtained a
lease from her late landlord, whose situation he now
knew.

'Stupidity, ma'am!' said Sandy, who was a dry
humorist, and possessed considerable versatility of
talent; 'don't abuse stupidity: there is nothing so
useful as a certain degree of stupidity. The stupidity
of one half of the world makes the other half live.
It is only when stupidity is so excessive as to render
the possessor useless, that it becomes offensive; fur

then it can do nothing for itself or anybody else. But a decent degree of stupidity is an absolute necessity of society. Without a certain amount of it in the world, I don't know how many might shut their shops. The end of stupidity would be the end of society, as at present constituted; therefore speak respectfully of stupidity. But stupidity is not your failing; it is too much trust, and that came into the world with original sin. Women *will* trust to the end of the chapter! But you'll have a *missive* of lease?' 'No.'

'Nor an offer followed by possession?'

'No.'

'What have you then?'

'Nothing!'

'Nothing like doing a thing out and out when you are at it! Have you a receipt for your rent?'

'Yes.'

'It's a mercy! Let's ha'e a look o't.'

Peney gave the paper, and while he was perusing it, watched every look, as if he had been a physician reading her case, and making up his opinion for life or death; soundly rating herself at the same time internally that she had been so foolish as to place herself in such a predicament.

'This says nothing good,' said Sandy; 'but fortunately it says nothing ill. But how you contrived to settle such a transaction without some scrap of writing or other'—

'There was a trifling note,' said Peney; 'but it says nothing; merely states the rent I was to pay.'

'And is that nothing, you taupie?' and he eagerly seized the note.

He looked at the note on both sides, and endwise also, lest there might be in any corner a latent word; and placing his foot against the chimney-jamb, looked to the ceiling for some time.

'This is in the handwriting of the landlord of course, or of his clerk, or factor?'

'It is in the handwriting of the landlord.'

'And there was no other writing?'

'Nothing else whatever; except, I think, his copying that into his book when he again returned it to me; and giving his hand, wished me prosperity, and we parted.'

'Oh,' said the legal adviser, 'in *that* case, and under all these *circumstances*, if they could be proved, you have as good a lease as need be, at least I think so: only, to do you justice, it is through no merit of yours: all pure accident: but no matter. And now, do you wish to punish the scamp? Because, if you do, I'm your man.'

'He certainly has not been very kind to me,' said Peney.

'You don't know half the kindness he intends you,' said Sandy. 'If you wish to see it, I will show it you; and if you don't then punish him, the world will owe you a grudge, particularly as it will be necessary to do so merely to do yourself justice. Therefore I'll tell you what you are to do—that is, if you are to be guided by me.'

Peney declared she would be guided wholly and solely by him, and by him only.

'You had better,' said Sandy, 'or I sincerely believe that in a very few months you'll be a beggar, as surely as the king's a gentleman.'

Peney repeated her vows of obedience, only begging he would say what she was to do.

'Then here are my directions: Go home as if nothing had happened; say nothing of your having been here; take no notice of your landlord's letter, nor of anything he may do, but keep me advised; and don't do that openly, but slip a letter into the post-office with your own hand, and not sealed with your thimble, if you please, for anybody has a thimble; and though I am a lawyer, I have a character.'

Peney bowed assent.

'Above all, no gossiping on the subject with your

neighbours, either male or female; nor even with your sweetheart, if you have one; for they would *burst* if they could not tell how you mean to tickle the laird. Ah how nicely I shall wind him a pirl!'

Peney again bowed in token of obedience.

'Now I'll tell you what you are to expect,' said the oracle. 'You'll see your farm let over your head, if any one be bad enough to take it; absolutely, if you do not frighten your landlord, that will be pickle the first; but if you do anything to alarm him, he will take care to preserve a loophole, and so you will miss fire. In due time he'll eject you!'

'Eject me!' said Peney. 'What is that?'

'Turn you out of house and home to be sure, without mercy and without remorse; at least I'll try that he shall!'

Peney looked bewildered.

'Because,' added Sandy, slapping the table, 'that's the cream of the jest!'

Peney still looked ignorant.

'That's to be the foundation of our action of damages!'

But Peney didn't want any damages; only the possession of her farm, or at least payment for the improvement of the land and fences, and for her drain-tiles, as had been promised: all her toil and anxiety she expected to see go for nothing.

'You shall lose nothing,' said Sandy firmly; 'that is, if you can keep your own counsel, and be guided by me: and by the bye, you are to remember this as a first thing: they'll be coming about you with papers—*sign nothing*, and *say nothing*. They may ask you to acknowledge that you have received a summons, and turn it into an agreement to remove, without legal proceedings; in which case you are done for, if you were the only woman on earth.' Peney promised she would neither write nor speak in reference to this matter.

'You had better not,' said the lawyer, 'or don't come near me: your life would not be safe. But in the hope that you are not to be an idiot, but a good and obedient client, I'll give you a glass of wine, and give it you with my own hand, in case the servants even of this house might blab, and spoil as good-a-looking case as a gentleman need wish to have.' With this he did as he proposed, and having joined in drinking confusion to all bad landlords, Peney returned home much comforted.

Everything happened as Sandy had predicted, which, though but in the usual course, raised him almost into a prophet in his client's eyes. The lands were let to a Mr Snoove, who had become rich by a legacy, and, having purchased Mount-Hooly for his heir, wanted this comfortable farm for a younger son. They came and looked over everything, and even arranged their plans of improvement in Peney's sight and hearing. She considered it prudent to show *some* feeling upon the occasion, and observed that they were about to receive the benefit of all her labours for years, while she might be turned upon the world penniless. Mr Snoove knew nothing about that, but observed what a pity it was that she had not had a lease. 'With honest men and gentlemen,' Peney was beginning, and meant to conclude by saying the justice of her case would have been sufficient, when Mr Snoove asked his son if he thought the house would suit, or if it must be wholly pulled down. This was a sore trial to Peney's spleen. She could have said something very edifying upon the ups and downs of life, upon the circumstances that had made him for the present great, and her for the present small, and particularly as to the excellence of the precept, 'not to gut fish till one gets them;' but she restrained herself, and merely said that she would permit no alterations while she remained there; and they parted with no very kindly feelings.

At last the day for removal or ejectment came; and though Peney had been comforted the very night before by an assurance that her agent would be with her in due time, she arose and dressed herself that morning with something of the feelings of one dressing for exe-

cution, and mainly comforting herself indeed with the reflection that it was not so.

Just as the hour was up, a person made his appearance, but seemingly so stricken in drink, that Peney plainly told him she could not then hear anything he might have to say, as she was very anxiously expecting some gentlemen upon business.

'No,' said the other, 'not gentlemen, only a gen'laman; and I am from that individual;' and taking out a great vulgar mull, he finished with an enormous pinch of snuff. The man's clothes were coarse, and all puckered, as if by sitting on them while wet; they were ill made, and seemed too small. He wore a brown wig, which was awry. His nose was red and fiery, as if it had lived for years on snuff and whisky; and his thumb-nail was never tired of tapping, with drunken gravity, against the lid of his mull, from which he perseveringly regaled himself. He was more like a drover's servant than any one acquainted with business, and Peney was quite appalled.

At that moment the messengers made their appearance coming to dispossess her. She was almost heart-broken while she asked if Mr M'Turk would not be there himself.

'Nobody but me, ma'am,' said the inveterate snuffer; 'but you'll see how I'll—I'll tickle the villains. Remain you to receive the gen'lmen; and do it with all civility: no deforming—deforming is dangerous. But before they have quite completed their business, call me!' and he staggered off, as if to lie down to sleep. Peney almost inclined to go also, and he saw it, when, patting her on the shoulder, and almost missing the shoulder occasionally in the operation, he said as she was so overcome, he would stand by her—he would stay and receive the gen'lmen himself; and he did so accordingly.

They came, and after some civil words, to which Peney made no answer, they read the warrant for ejectment, which our drunken friend pronounced all right, quite right, nothing could be more so; but he added that he had a little bit of a paper about him somewhere; and with that he contrived to draw from his pocket a letter, which he opened with some difficulty, it being very much crumpled, and handing it to the officer, asked him to 'read that: quite a simple thing, only it does the business; and I suppose when you have duly considered it, you'll pack up your traps and toddle.'

The officer said it seemed to be a copy of a *sist*; but it was in noway authenticated, nor notoriously intimated, and so they must proceed.

'Seems a *sist*!' said the apparent drunkard; 'and not intimated! Have you no eyes: can you not hear? Have you no ears: can you not read? But, however, you, Joseph Jaap, and Charles Scowther, Esquires! listen to what I shall read:—"To see and answer within fourteen days, and in the meantime sists procedure"—signed "Caleb Maunder," whom everybody knows to be a senator of the College of Justice, under the style and title of Lord Balcrabbit, and an excellent judge he is; and attested, as a true copy, by Cosmo Balderstone, S.S.C. As to the person that intimates the *sist*, that is of no consequence; that is the document, and any one contravening it proceeds at his peril—in my opinion.'

The officers proceeded, however, to the seeming astonishment of our drunken friend, who informed his hearers, that as the document he had had the honour to intimate proceeded *ex deliberatione dorum concilii et sessi*!* they, in his person, defied the whole Court of Session, and through that the king and all his forces! Still they proceeded, and took a pot from the kitchen fire and placed it on the green, as a symbol of the furniture being ejected.

'I take instruments in your hands, Joseph Jaap,' quoth the tipsey man, 'that here has been a violent

intromitting with one of his majesty's kail-pots! or at least with the kail-pot of a lady under his majesty's protection.'

They next removed the fire from the hearth, led poor Peney from her domicile, her servants accompanying her; our drunken friend all the time exhibiting an immensity of Bardolphian astonishment, and snuffing violently; and finally the officer locked the door, and put the key in his pocket.

'Well, that's complete anyway,' said the drunken envoy; 'very. Will you favour me with the name of the gen'lman who has done all these fine things, and a schedule of your execution as soon as may be?'

'Presently,' said the officer, and immediately drew it out.

'Insert—I say, insert—that a *sist* was intimated; will you?'

But the officer declined, as it had not been regularly intimated.

'Then I must preserve the fact in my own way. What is your exact profession if you please, for I am not sure what these hieroglyphics may mean?'

'I am a messenger-at-arms,' said the officer, drawing himself up with dignity, 'as my signature clearly shows.'

'And I,' said our friend, 'am Alexander M'Turk, solicitor at law, as that signature more clearly shows,' and with that he handed him a copy schedule of protest.

'Mr M'Turk,' said Peney, seizing him with both her hands, 'how could you torment one so?'

'All for your good, as the Spaniard said when he went to hang the prince.'

'Mr M'Turk,' said the officer, stammering, and looking very pale, 'you'll remember that, in intimating that *sist*, you did not announce yourself as an official person.'

'Neither do I now,' said the audacious Sandy, quite recovered from his pretended drunkenness. 'I wish to try the point whether the orders of the Court of Session may not be intimated by a colley dog!'

'And so you mean to oppose this removal?'

'Yes—everything. I'll floor this fellow, and I'll floor you! I'll have your very concurrents up for meddling with this lady's kail-pot, for they at least held no warrant for their impudence. A sheriff's officer has no right to act in such a matter by another hand.'

'I am willing to restore possession upon caution,' said the officer.

'But we won't accept it,' said the lawyer, 'even without caution. You will be glad to give it upon any terms; and in the meantime, you are answerable for this property, and for all damages and expenses; and Miss Glendinning and her family must go and live at an inn.' So saying, he made his bow, and walked off arm in arm with his client, the servants bringing up the rear, and those left behind looking very disconsolate upon their ejected kail-pot.

We may pause to mention that a *sist* is an order issuing from a judge of the Supreme Court to stay proceedings in a cause upon allegation of error, until there is time to inquire into the truth and effect of the allegations; and though it often vexes an eager or vindictive litigant to be stopped in mid-volley, and within sight of his prey, it as often serves the ends of justice, and even betters the position of the pursuer; for if the grounds of *sist* appear at all doubtful, security to abide all consequences must be found, and still the suspension may be quashed at the end of the fourteen days.

In consequence of having proceeded to eject in the face of this important injunction, Baldriddle was placed in a most unpleasant dilemma; for his agent had committed an illegal act, and exposed him to an action of damages. A somewhat complicated law-plea now ensued, in which the whole question as to the validity of the lease was debated. With the *per contra* plea for wrongous ejectment, it was considered one of the prettiest cases that had for some years been before the courts. Sandy M'Turk's prognostications proved to be

* The abbreviates of *ex deliberatione dominorum concilii et sessionis*, but spoken by ignorant persons as written.

well-founded. It was finally decided that the slip declaring the rent of the farm, in the handwriting of the landlord (and it would have been the same if by any one authorised by him), followed as it had been by possession, and the payment and receipt of rent, was evidence sufficient of 'an agreement for a lease'—the usual and therefore legal period of lease being nineteen years.

Peney therefore triumphed in the question as to the lease, and not being vindictive, she accepted a compromise for the indignity of ejection, all her expenses of course being paid. The result added much to the fame of Peney's solicitor, and in like proportion damaged the character of her landlord. Baldriddle was thenceforth a marked man; other landlords were shy of his acquaintance; and to increase his humiliation, his wife and daughters, notwithstanding many efforts, were unable to cultivate a visiting acquaintance with the ladies of the county. All heartily wished themselves back to the Cowcaddens; and Andrew was heard to confess that he had never anywhere been so happy as when 'makin' siller in his small office in Miller Street.'

The object of Baldriddle's oppressive measures was, on the contrary, quite at her ease. She might have continued in the possession of her greatly-improved farm till the end of her period; but from what had passed, she was anxious to cede possession; and fortunately, her proposed successor remained anxious to obtain it. Peney therefore retired on an agreement to receive the surplus rent for the remainder of the lease.

This true story is not without its moral. It has shown that the law of landlord and tenant in Scotland is mixed up with justice, and 'leans to virtue's side.' It constantly sides with honesty of intention against attempted roguery; and aims at substantial justice in disregard of pure law; and though the safety of this may be questioned by sticklers, it is only by at the same time questioning human integrity. It is the only species of law by which society can be made happy or prosperous; and Scotland is an example of its efficacy, as countries not far remote are of the miseries flowing from a different system. In these countries triumph would have crowned the miserable doings of the NEW LAIRD OF BALDRIDDLE.

NEW DISCOVERIES IN AUSTRALIA.

NOTWITHSTANDING all that has been written on the subject of Australia, public attention is still called to the subject from time to time by the reports of new enterprises or new discoveries in that remarkable country. A further contribution to our stock of information on the subject has just been made by Sir T. L. Mitchell, surveyor-general of the southern colony, in a work which presents several claims to notice.* This gentleman is already favourably known as an active explorer. The object of the late expedition was to discover, if possible, a direct overland route from Sydney to the Gulf of Carpentaria; a route the more necessary, in consequence of the increasing trade with India, for which the only channel at present is the dangerous passage of Torres' Straits. A glance at the map of Australia will show the extent of this journey—from twelve to fifteen hundred miles—the greater portion over a country never previously visited by civilised man. Such an expedition, combining the promise of a beneficial commercial result with the excitement of adventure, commends itself especially to the feelings of Englishmen; and it is not surprising that the convicts on good be-

haviour, twenty-three of whom were selected for the working division, should have volunteered to join the expedition. The expenses of the journey were provided for by a grant of £2000 from the colonial legislature; provisions were laid in for a year, with drays and bullocks for transport, and 250 sheep, besides carts and horses. The party left Sydney in November 1845.

Approaching the confines of the settled districts, Sir T. Mitchell draws a very unfavourable picture of the squatters, the outliers of civilisation, but possessing apparently none of its virtues. To their brutal recklessness much of the hostility of the natives is to be attributed. As soon as the white man makes his appearance with his herds of cattle, the beauty of the grassy plains and valleys disappears, and the clear ponds, which have long supplied the tribes with water, are trampled into mud-holes. It is easy to conceive the effect of such an intrusion on the mind of the aborigines.

The condition of some of these pioneers of colonisation does not appear to be promising. Sir T. Mitchell gives us a specimen:—'Calling,' he writes, 'at a shepherd's hut to ask the way, an Irishwoman appeared, with a child at her breast, and another by her side: she was hut-keeper. She had been there two years, and only complained that they had never been able to get any potatoes to plant. She and her husband were about to leave the place next day, and they seemed uncertain as to where they should go. Two miles further on, a shoemaker came to the door of a hut, and accompanied me to set me on the right road. I inquired how he found work in these wild parts. He said he could get plenty of work, but very little money; that it was chiefly contract work he lived by: he supplied sheep-owners with shoes for their men, at so much per pair. His conversation was about the difficulty a poor man had in providing for his family. He had once possessed about forty cows, which he had been obliged to intrust to the care of another man at 5s. per head. This man neglected them: they were impounded, and sold as unlicensed cattle under the new regulations.

"So you saw no more of them?"

"Oh yes, your honour, I saw some of them *after they had been sold at the pound*! I wanted to have had something provided for a small family of children; and if I had only had a few acres of ground, I could have kept my cows."

'This was merely a passing remark, made with a laugh, as we walked along. But the fate of a poor man's family was a serious subject. Such was the hopeless condition of a useful mechanic, ready for work even in the desolate forests skirting the haunts of the savage. So fares it with the *dijecta membra* of towns and villages, when such arrangements are left to the people themselves in a new colony.'

The great difficulty in penetrating into the interior of Australia is want of water, aggravated by intense heat. We read of 'hot winds that blew like a furnace,' with a temperature of 129 degrees, and inside the tent 117 degrees. At times, the party, after toiling in the fierce heat all day, were compelled to pass the night without water; the distress and anxiety on such occasions are indescribable. Cattle died, and men were nearly going mad for want of water; in addition to which, several of the number, including the leader, were attacked by ophthalmia. It was after crossing the Bogan, and while traversing the arid district between that river and the Macquarrie, that the worst of these disastrous effects were experienced. Near the dry bed

* Journal of an Expedition into the Interior of Tropical Australia, in Search of a Route from Sydney to the Gulf of Carpentaria. By Lieutenant-Colonel Sir T. L. Mitchell, &c. London: Longmans. 1848.

of the latter stream, a halt of some days was made, to enable the party to recruit and repair the vehicles. Here they heard from some passing horsemen of a flood coming down from the eastward, caused by rain having fallen in the Turon mountains; and towards the close of the day, two of the men, who had been walking several miles up the dry channel, came in and reported their surprise and narrow escape from the descending stream. Night came on, and still it had not made its appearance; but a few hours later, a distant crashing roar drew many of the party from their repose in the camp to the bank. Not one among them had ever witnessed such a sight before. 'At length,' pursues the narrative, 'it rushed into our sight, glittering in the moonbeams, a moving cataract, tossing before it ancient trees, and snapping them against its banks. It was preceded by a point of meandering water, picking its way, like a thing of life, through the deepest parts of the dark, dry, and shady bed, of what thus again became a flowing river. By my party, situated as we were at that time, beating about the country, and impeding in our journey solely by the almost total absence of water—suffering excessively from thirst and extreme heat—I am convinced the scene can never be forgotten. Here came at once abundance, the product of storms in the far-off mountains that overlooked our homes. My first impulse was to have welcomed this flood on my knees, for the scene was sublime in itself, while the subject—an abundance of water sent to us in a desert—greatly heightened the effect to our eyes. Suffice it to say, I had witnessed nothing of such interest in all my Australian travels.' A fortnight afterwards, the travellers reached the final outlet of the Macquarrie, which stream, in common with other Australian rivers, and contrary to what takes place in other parts of the world, diminishes in volume the farther it extends from its source. In this place the Macquarrie had dwindled down to a muddy ditch, which any one might step across. 'The flood had gone to fill thousands of lagoons, without which supply, those vast regions had been unfit for animal existence. Here,' adds Sir T. Mitchell, 'we discover another instance of that wonderful wisdom which becomes more and more apparent to man, when he either looks as far as he can into space, or attentively examines the arrangement of any matter more accessible to him. The very slight inclination of the surface of these extensive plains seems finely adapted to the extremely dry and warm climate over this part of the earth. The slope is so gentle, that the waters spread into a network of reservoirs, that serve to irrigate vast plains, and fill lagoons with those floods that, when confined in any one continuous channel, would at once run off into the ocean.' As the party advance, the fertility of the soil appears in the luxuriant vegetation. A species of grass, *Panicum laevinode*, is described as reaching up to the saddle-girths during many miles of the route. The seeds of this plant, when pounded, are made into a sort of bread, and eaten by the natives; in some places the grass was found pulled up over a large extent of ground, and laid in heaps to dry. In connection with this part of the subject, we may mention that wherever a sheep or cattle station is established, the hoarhound plant is sure to spring up in great abundance; and no sooner does the white man take up his quarters in any part of the country, than the couch, or dog's-tooth grass, although previously unknown, immediately makes its appearance. These phenomena, which are difficult of explanation, have a parallel in the animal kingdom in the appearance of the turnip-fly, in whatever part of the world English turnip seed may be sown.

A division took place on arrival at the Balonne river. Sir T. Mitchell pushed forward with a detachment, leaving the heavy baggage to follow, under charge of the second in command. They were now approaching what is comparatively rare in Australia—a hilly district, on the northern slopes of which they hoped to find a water-shed and river flowing towards the gulf. Height

after height was ascended by the indefatigable leader with his theodolite, so as to be able to lay down a correct map of the route by trigonometrical survey. These eminences commanded a broad expanse of country; 'but the most interesting sight to me,' he observes, 'was that of "blue pics" at a great distance to the north-west—the object of all my dreams of discovery for years. No white man had ever before seen these. There we might hope to find the *divisio aquarum* still undiscovered, the pass to Carpentaria still unexplored.'

In June 1846, an encampment was made on the banks of the Maranoa, where the majority of the party were to remain, while Sir T. Mitchell and a few men advanced rapidly towards the point on which all their hopes were fixed. This part of the journey, which occupied several months, embraced a region of great natural beauty and amazing fertility. Among the hills all apprehensions were removed as to finding water; the blue pics were successively passed, and named after the first living savans of England; and the party were rewarded by the sight of scenery whose sublime features will one day inspire the painters of the southern hemisphere. In fact, the author's expression of his feelings, the unbounded sense of freedom and delight awakened by the limitless landscape, can hardly be appreciated by those who dwell in a land laid out by acts of parliament. Something new met the explorers at almost every step—new birds, new plants. Bees were found scarcely larger in size than gnats or mosquitoes, whose deposits of honey in hollow trees often furnished the travellers with an agreeable regale. The honey is described as transparent and slightly acid; but the wax in which it is enclosed, 'in appearance and taste much resembled fine gingerbread.' There were trees, too, 'of a very droll form. . . . The trunk bulged out in the middle like a barrel to nearly twice the diameter at the ground, or of that at the first springing of the branches above.' A huge pear growing out of the ground, with the small end downwards, and a head of graceful branches spreading from the top, would convey a fair idea of one of these singular objects. Sir T. Mitchell saw one which was thirty feet girth in the swell, and not more than sixteen at the base; he named the tree *Delabechea*, in honour of an eminent geologist. 'Of its quality,' he writes, 'much remains to be said when it becomes better known; the wood being so light, moist, and full of gum, that a man, having a knife or tomahawk, might live by the side of one without other food or water; as if nature, in pity for the most distressed of mortals, hiding in solitary places, had planted even there this tree of abundance. The wood must contain a great portion of mucilage, for on chewing it, it seems to contain as much nutritious matter as fibre.' As these trees throw out seed pods, we doubt not that ere long some of our enterprising collectors will have specimens growing in their nurseries.

Unfortunately, the main object of the expedition was not realised: on the 25th September the party, through want of provisions, were compelled to retrace their steps, just at the time that the prospect of success was most promising; for they had discovered a magnificent river, four hundred yards wide, which they named the Victoria, running to all appearance in a direct line for the head of the gulf. By the end of the year the band of explorers had returned to Sydney, when the remainder of the cattle and vehicles, &c. was sold for £500. With this sum a second expedition was equipped, and placed in charge of Mr Kennedy, Sir T. Mitchell's second. The fatal encumbrance of drays and oxen in this case will present no obstacle; the party consists of eight men mounted, and the baggage is conveyed in light carts. They started in January 1847, to resume the exploration at the point where it had been left off on the former journey, and follow down the Victoria, which in all probability will bring them to Carpentaria. Looking at the benefits, immediate and prospective,

likely to result from this new attempt to solve the problem of an overland route to meet a line of steamers from Singapore, it is impossible not to wish prosperity and complete success to the enterprise.

CHEMISTRY OF SUMMER.

THE seed, weighing only a few grains, which we threw into the earth in spring, has now become a plant of several ounces weight. Whence comes the additional bulk, and of what does it consist? The pale vernal flowers of a month or two ago have now given place to others of rich and glowing hue. What causes the change? Has the flushed petal some mystic sympathy with the ruddy cheek? And if so, on what principle do men and plants alike draw health and beauty from the influences of summer? Such questions cannot fail to suggest themselves at the present season; and they are answered in a very agreeable manner in a volume to which we wish to draw our readers' attention, treating of those natural phenomena of the year which admit of interpretation by chemical science.*

A vegetable, and the generality of vegetable products, such as lignin or woody fibre, sugar, and starch, are found, on analysis, to be composed, one-half of carbon, and one-half of the constituents of water—oxygen and hydrogen. An average-sized oak, therefore, weighing about sixty tons, contains thirty tons of carbon; and the half million tons of sugar consumed annually by the population of Europe, contain a quarter of a million tons of carbon. One's first idea is, that this enormous quantity of a solid element must be derived from the solid earth; but chemistry demonstrates that the earth loses no considerable weight through the growth of plants. The following experiment is conclusive:—'Two hundred pounds of earth were dried in an oven, and afterwards put into a large earthenware vessel; the earth was then moistened with rain-water, and a willow tree, weighing five pounds, was planted therein. During the space of five years, the earth was carefully watered with rain-water, or pure water; the willow grew and flourished; and to prevent the earth from being mixed with fresh earth, or dust blown upon it by the winds, it was covered with a metal plate, perforated with a great number of small holes, suitable for the free admission of air only. After growing in the earth for five years, the willow-tree was removed, and found to weigh one hundred and sixty-nine pounds, and about three ounces; the leaves which fell from the tree every autumn were not included in this weight. The earth was then removed from the vessel, again dried in the oven, and afterwards weighed; it was discovered to have lost only about two ounces of its original weight; thus one hundred and sixty-four pounds of lignin or woody fibre, bark, roots, &c. were certainly produced—but from what source?'

Ay, from what source? The chemist who made this remarkable experiment concluded, almost as a matter of course, that the tree derived the increase in its contents from water, the only obvious source; and it was left to succeeding inquirers to ascertain that it is from the thin air we breathe that the solid element is obtained which enters into the structure of the vegetable kingdom. That this element exists in the atmosphere, the chemist knows, because he is able to decompose its carbonic acid, and produce the solid carbon; but he likewise knows that the same process is performed by the leaves of the trees, in so admirably perfect a manner, as to shame his highest skill.

The enormous supply of carbon existing in the air is constantly kept up by the respiration of man and animals, and various other processes. 'The volume or bulk of carbonic acid produced by a healthy adult individual in twenty-four hours, amounts to about 15,000

cubic inches, containing about 2600 grains of carbon, or about six ounces, or to between 37 and 38 pounds, from every hundred persons; so that assuming 37 pounds as the average, one million of human beings would thus exhale into the surrounding air a compound containing no less than 370,000 pounds, or upwards of 165 tons of carbon!' The carbonic acid so exhaled is in itself poisonous, but its bad effects are neutralised to a certain extent by its diffusion through the atmosphere (constituting not more than 1-2000th part of any given amount of atmospheric air), while it is continually decomposed by the plants, which absorb it into their systems as food, retaining the carbon, and emitting again the oxygen, so as to purify the atmosphere while sustaining themselves. This was demonstrated long ago by experiment. Insert a lighted wax taper in a bottle, and keep it there till the flame dies for want of nourishment; withdraw the extinguished taper, introducing instantly in its stead a sprig or two of growing mint, and putting the stopper in the bottle, place it in the sunshine. 'The combustion of the taper in the confined portion of the air has withdrawn the greater portion of its oxygen, and formed carbonic acid, and liberated nitrogen; the rays of the sun will excite the leaves of the mint to decompose the carbonic acid, to secrete its carbon, and to liberate oxygen, which, blending with the unaltered nitrogen, will restore the contents of the bottle to their original condition: this fact is proved by removing the stopper after a few days, and again introducing the lighted taper; it will then burn, as it did at the outset of the experiment.' Thus it appears to be the task of the vegetable kingdom to sustain the uniform balance of the constituents of the atmosphere. 'From these discoveries, we are assured that no vegetable grows in vain; but that, from the oak of the forest to the grass of the field, every individual plant is serviceable to mankind; if not always distinguished by some private virtue, yet making a part of the whole which cleanses and purifies the atmosphere. In this the fragrant rose and deadly nightshade co-operate; nor is the herbage nor the woods that flourish in the most remote and unpeopled regions unprofitable to us, nor we to them, considering how constantly the winds convey to them our vitiated air for our relief and their nourishment.'

We have said that the bottle must be placed in the sunshine; and without this, the mint could not receive the necessary stimulus for the performance of its functions. Shut up a plant in darkness for a few days, and although enjoying its usual share of heat, air, and water, it becomes languid and pale; restore it to the sunshine, and in a few hours it will regain health and verdancy. But the nature of the agency of solar light is not understood. 'Thus some leaves are acid in the morning, tasteless at noon, and bitter at night; some flowers are white or blue, according to the intensity of the light; many fruits are more acid in the morning than in the evening; some flowers expand their petals to meet the sunshine, others close them against its power.' The portion of a peach which is fully exposed to the light is of a crimson hue, while the rest is pale-green and yellow. The taste of the former is the more luscious, because light has there stimulated the elaboration of most sugar; and on this principle we can account for the extreme sweetness of the fruits of a southern climate.

Some plants, however, are rendered less fit for food by having too much light when growing. The stem of celery, for instance, must be covered with earth, in order to become blanched and aromatic; and lettuces must be tied, to insure a white and wholesome heart. The portion of the celery that remains above ground, and the exterior leaves of the lettuce, are green, bitter, and unwholesome.

A striking analogy, as regards the influence of light, may be traced between the animal and vegetable kingdoms. A ruddy mountaineer, if immured in a dungeon, becomes pale and sickly even with a proper supply of food; while the usual pallor of the miner is partially

* Chemistry of the Four Seasons, Spring, Summer, Autumn, and Winter. By T. Griffiths, Professor of Chemistry in the Medical College of St Bartholomew's Hospital, &c. Churchill, London.

removed by occasional excursions into the light of day. Neither men nor plants flourish in murky situations or impure air: in the immediate neighbourhood of large cities, we find more commonly than otherwise pale faces and withered leaves. The analogy between animal and vegetable life goes still farther; for the poisons that destroy a man will destroy a plant. If we take white arsenic, corrosive sublimate, blue vitriol, prussic acid, or opium, and dissolve them in water, the solution applied to the roots of a plant will cause it to droop and die. Beans so treated with white arsenic faded in a few hours, then became yellow, and were dead in three days. A lilac was killed by the introduction of some of the solid poison into a cut made in one of its branches. Prussic acid was fatal to a succulent plant in a single day, and spirits of wine in a few hours. That these substances really act as poisons, by entering into the circulation of the plant, is demonstrable in the case of blue vitriol. Cut through the stem of the plant that has been killed by this sulphate of copper with a clean steel knife, and you will see bright metallic copper revived on the blade.

The circulation of vegetable blood, termed sap, is involved in obscurity; and the substance itself cannot be accurately analysed, as it seems impossible to obtain it in its normal state. Its evaporation from the leaves, after it has traversed the stem and branches, is enormous. A large sun-flower was discovered to have lost one pound four ounces, and a cabbage one pound three ounces, in twenty-four hours. The drooping of a plant in a hot day is caused by this evaporation from the leaves being greater in proportion than the suction of water by the roots. Supply the moisture for which it faints, and the patient will revive.

The radicles which drink from the earth that vivifying water which is to be elaborated into sap are so minute in their terminal fibres, as to be difficult of detection, even by a microscope. If injured in transplanting, their functions are proportionably impaired. It might be supposed that, on a very dry dusty day, these functions would be completely suspended; but in fact the earth is so bad a conductor of heat, that extreme aridity prevails only on the surface. On the hottest day, if you remove a few inches of the dry and sandy soil, you arrive at moisture. In like manner the atmosphere is never anhydrous, or entirely devoid of watery vapour; although occasionally it may be dry enough to have a distressing effect both upon animals and vegetables. The vapour, partially withdrawn from particular localities, is collected elsewhere in clouds, which, floating between the sun and the earth, prevent the direct transmission of solar heat. When these aggregates complete the genial work by falling in showers, it is curious to remark the burst of perfume that comes from the fainting plants.

That the earth is a bad conductor of heat, is shown by the comparative coolness of a draught of water drawn from a deep spring in summer, and the comparative warmth of water from the same source in winter. The temperature of the water, in point of fact, is nearly the same at both seasons; and at a depth of 100 feet, that of the earth is the average temperature of the climate, differing of course with the latitude. At Wadso, in Lapland, the average is 36°, at St Petersburg 40°, in England 52°, at Paris 54°, at Rome 61°, and at Cairo 70°. The reception of heat by the earth is the cause of a phenomenon which is often regarded with surprise. This is the tremulous motion of objects regarded across a tract of dark-coloured land on a hot summer day. 'The land becomes exceedingly hot by absorbing the solar rays, and imparts heat to the air incumbent on its surface; the air so heated becomes lighter, and ascends, whilst a colder and heavier portion descends, so that the solar light, in traversing a medium of such unequal density, does not pass through with steadiness, but is distorted, or broken, or refracted, and the rays coming to the eye of the observer with irregularity, the objects consequently appear distorted.'

The formation of clouds, and the fall of rain, have not been explained; but chemistry comes to the conclusion that rain does not consist of solid globules, but of myriads of hollow vesicles of water, like soap-bubbles. Were it otherwise, the clouds could not hover above our heads as they do; for a drop with a diameter of a thousandth part of an inch would acquire, from attraction of gravitation, a velocity of nine or ten feet per second. And the clouds, we know, do not merely hover, but are carried from the lake or sea which gives them birth into the inland country, or to the tops of mountains.

The air, however, always contains the vapour of water in suspension; and this invisible vapour, when its temperature falls, either by sudden local rarefaction, or by contact with cold surfaces of the earth and waters, becomes visible in the minute drops of water termed mist. The heat requisite to raise and sustain this vapour is not equally dense throughout the atmosphere, because the atmosphere becomes thinner as its distance from the earth increases. 'Suppose a cubic foot of air contain a certain amount of heat, equally diffused throughout its elementary and compound constituents, and capable of affecting the thermometer to a given degree; if this volume of air be compressed to one-tenth of a cubic foot, of course there will be ten times as much heat concentrated into that tenth as there was, and the thermometer would indicate a rise of temperature. On the other hand, suppose the cubic foot of air to be expanded to ten cubic feet, the heat would be so diffused throughout such volume, that the thermometer would indicate depression of temperature, or, in other words, the air would feel cold.' The cause of the air being denser, and therefore warmer, as it approaches the earth, is simply that it bears the superincumbent load of the rest of the atmosphere, and is pressed, as it were, into smaller compass.

This explains the diminution of heat as we ascend a lofty mountain; the air becoming rarer and rarer, or, in other words, more expanded, till not unfrequently the watery vapour it contains condenses in mist, or congeals as snow. 'Air, in rising from the level of the sea, becomes nearly 1 degree colder for the first two hundred feet of ascent, and altogether about 50 degrees colder in rising fifteen thousand feet; thus water would freeze at this elevation even near the equator, where the temperature of the low plains is at least 80 degrees. This is the reason why the summits of lofty mountains are covered with perpetual snow, and the height at which it occurs is called the "snow line," or "line of perpetual congelation."'

The conversion of water into vapour—that is to say, the process of evaporation—requires heat; and the substances by which this heat is imparted of course become cold. Thus in India they have sometimes curtains instead of windows; and these being sprinkled with water, a rapid evaporation reduces the temperature ten or even fifteen degrees. Even in England, in very hot weather, relief is sought and obtained by sprinkling water on the pavement before our houses. Porous earthenware vessels are used for wine-coolers on the same principle. Being dipped in water, they imbibe a considerable quantity by capillary attraction; and as this gradually evaporates on the vessel being removed into the air, the wine-bottle within contributes a portion of heat towards the process, and becomes cool itself in the same ratio. For the same reason, it is dangerous to remain in wet clothes, the evaporation lowering the animal heat of the body below its natural standard. Exercise, on the other hand, by inciting the evolution of animal heat, supplies the unusual demand, and diminishes the risk in proportion. When too much heat is produced by exercise, the evaporation from the body is condensed in sweat; and when this is checked by a cold draught of air, waterproof clothing, or other causes, the most serious consequences ensue. A fine cambric handkerchief applied to the brow gives great relief, because its fine fibres are at once a good conductor of heat, and

have a strong capillary attraction for moisture; whereas a cotton handkerchief, having neither of these advantages, produces rather a sensation of heat. 'Accurate experiments appear to justify the conclusion, that the annual evaporation of water averages thirty inches; meaning that the vapour, if reconverted into water, would cover the surface from which it ascended to a depth of thirty inches; then the surface of all the waters of the globe being assumed at one hundred and twenty-eight millions of geographical miles, nearly sixty thousand cubic miles of water would be annually changed into vapour.'

The winds, which are so important to our comfort in summer, are caused by the incessant disturbance of the equilibrium of the atmosphere by heat. The phenomena of land and sea-breezes are thus explained by the chemist. 'The solar beams are incapable of elevating the temperature of the transparent water of the ocean, or the transparent volume of the atmosphere, but they heat the surface of the opaque earth with great facility; therefore an island exposed to the tropical sun has its soil greatly elevated in temperature, and communicating heat to the air, a strong ascending current is produced, whilst other portions of air from the cooler surface of the ocean immediately glide inland to restore the equilibrium, and this constitutes the sea-breeze. During the night, the surface of the island, no longer subject to the direct influence of the sun, becomes much cooler than the superincumbent air, and causes it to contract in volume, to become heavier, therefore it sinks down, and spreads on all sides, producing the land-breeze; this is frequently loaded with unhealthy exhalations from decomposing vegetation, whilst the sea-breeze is salubrious and fresh.'

Such are only a few of the inquiries prompted by the beautiful season on which we are entering; but they are sufficient to show that the laborious chemist is introduced by his ceaseless experiments into at least some acquaintance with the sublime laboratory of nature; and that he is led, by this examination, on a minor scale, of the properties of bodies, to reason upon the phenomena of the seasons, and to act in some degree as an expounder to mankind of the physical plan and government of the earth. There is no department of science better adapted than chemistry to plant in the mind a firm belief in the power, wisdom, and goodness of the Creator.

SUMMER EXCURSION IN GERMANY.

LINZ TO VIENNA.

On opening the jalousies of our windows on the morning after our arrival at Linz, we observed that in the long and handsome street below all business was suspended; and although still early, long processions of little girls, dressed in white frocks, and with ribbons and wreaths of flowers in their hair, were seen pouring to the churches. Occasionally, also, a school of boys, in their best attire, was seen parading along the street, too happy in the prospect of a holiday, to be kept perfectly in order by the preceptor. Countrymen in red waistcoats were also coming pretty thickly into town; and in the crowds which passed might be noticed gaily-attired females, with head-dresses of cloth of gold, and rosaries of less or more value in their hands. It was evident they were going to make a day of it; and so we hurried over breakfast, and got down to the streets just as matters were waxing to a crisis.

The day was the 3d of June—this year, Corpus Christi, but better known on the continent as the *fête Dieu*. Fortunately, the weather was beautiful, and when that is the case, a holiday is acceptable on any pretence. I was delighted to see the people enjoying themselves, albeit the affair which called them together was somewhat unintelligible. Hurrying to

the great central Platz, we found it crammed, a part in the middle, however, being kept clear by soldiers; and we had scarcely procured a good point of sight, when a grand procession of clergy of all orders, nobility, gentry, and others, commenced, every one carrying an unlighted candle in his hand about six feet in length. At the head of the long line of dignitaries walked an aged priest with long white hair, and by this venerable personage mass was performed at several places in the open street—the altars for the occasion, gorgeously overhung with crimson velvet and gold, and embellished with the richest plate, being erected against the face of a house. Each mass occupied about a quarter of an hour, and at its conclusion, the whole troops fired a volley in the air, which was replied to by the firing of cannon from one of the forts in the neighbourhood. The last mass was performed at a high altar erected in the centre of the Platz; and when all was over, the procession was dissolved in an adjoining church. The devotion manifested by the vast crowds of persons of all ranks was apparently sincere; and one thing seemed to me praiseworthy beyond controversy, that when the religious duties of the day were finished, there was no disorderliness, no drunkenness, nor any of the other abominations which usually shock propriety in the streets of Scottish cities on holiday evenings. At Vienna, the *fête Dieu* is conducted with great magnificence, the emperor in his robes not disdaining to carry a candle; yet I was not sorry to have seen the spectacle on a smaller scale, for I was afterwards told that we could not possibly have obtained accommodation in the capital.

In the after-part of the day I walked through the town in all directions, and then ascended to the higher ground in the environs, whence a good view is to be obtained of the valley of the Danube and surrounding country. Linz is large and well built, and occupies a pleasant situation on the left bank of the Danube, which is here a stream of a very different size from what I had seen at Ulm. Augmented by the Iser, the Inn, the Salza, and other considerable rivers, it rolls past Linz a mighty flood, the volume of water being apparently equal in bulk to that of the Rhine. By going round by Salzburg, I had unfortunately lost some of the best bits of scenery on the Danube—the very best being near Passau; but there was consolation in thinking that we had enjoyed an equivalent, and that a day's steaming, which still awaited us, was better than nothing. Neither in Linz nor its neighbourhood is there a single thing to detain travellers, unless, indeed, they have a fancy for inspecting fortifications. At different salient points around the town, on both sides of the Danube, are erected thirty-two detached forts, each looking like a low martello tower, and mounted with guns; they have been planted in this quarter with the design of retarding and vexing the progress of any future Napoleon who may think of visiting Vienna via the vale of the Danube. These forts, which are new, and untried in strategy, and therefore not militarily orthodox, are the invention of Prince Maximilian of Este. I did deem them worthy of a visit.

Before a traveller can leave any town in Austria, he must not only have his passport *visé*, but procure a bit of badly-printed paper from the police, called a *Passer Shien*, and this he is called on to give up to a sentinel when he departs. Not till going to bed did I remember I had not got my *shien*; and it was only after a good deal of trouble that it could be negotiated so late at night. When this giant was slain, another appeared. The hotel was full of guests, and, as usual, our room was separated only by a thin door from the adjoining apartment in the suite. Our neighbours were Germans, and their noisy talking was intolerable. They spoke as

loudly as if they had been hailing each other across the street. Repose was out of the question. It was no use our talking in a moderate key, in the hope of shaming them into silence. A severe malady requires a severe remedy. Lighting a candle, I took up Mrs C.'s crotchet book, and gave them an example of reading in English which astonished them. The effect was magical. My harangue on crotchet working in an instant drowned their horrible jargon, and their voices sunk to a whisper. They listened, and whispered again. The phenomenon of English was dumfounding—perhaps I was an English maniac? Whatever were their conjectures, the reading settled them; for we were no more troubled with their screeching, and gladly went to sleep, preparatory to an early start for Vienna. As daylight came in, our loquacious neighbours broke out, as if from a moment's forgetfulness; but a few sentences from the crotchet book, as we made our toilet, brought them to their senses, and we heard them no more. Our own aristocracy—the real as well as the vulgar counterfeit—affect loud talking, to the annoyance of all who are near them: might not some plan, such as I happily thought of, be tried in order to teach them good manners?

The morning was beautiful, and at seven o'clock we were on board the steamer, which lay hissing at the quay. The vessel was large and commodious, seemingly under careful management, and on the deck there mustered nearly a hundred passengers of various nations—artists in mustaches and gray fancy hats from Munich; Hungarians returning from a distant excursion; no English but ourselves; one or two French; and a good many Germans of miscellaneous ages and appearance—a vastly respectable company, as the steward most likely thought, in making his calculations as to how many were likely to figure at the table-d'hôte. Off we went down the broad bosom of the Danube, all looking forward to a pleasant run of nine or ten hours. At first there was little to excite interest. The banks were generally level, and here and there muddy islands, covered with willows, divided the channel, and closed up the scene. By and by the hills approached the stream, and villages nestling at their base, and castles or monasteries crowning their summits, reminded us somewhat of the Rhine; but with a few exceptions, the main features of the landscape were totally different. On the Rhine all is ancient; the universal ruin of the castles, which are perched on the tops of the crags, speaks of a bygone age—a period of rapine and insecurity. On the Danube, almost every building is comparatively modern and inhabited. The grandest edifices are the monasteries. Half way between Linz and Vienna, on our right, we came to a short passage below the loftily-perched and palace-like convent of Molk. Good times, it may be said, for the monks; but the monks are Benedictines, which is equivalent to saying they are scholars and gentlemen; and their spacious mansion is as much an educational as a religious establishment; in this respect, the social condition of Austria being analogous to what it was in our own country previous to the convulsions of the sixteenth century.

About and below Molk, the banks of the Danube increase in picturesque beauty; and on the left side the vine makes its appearance, though on a scale not to be compared with what is seen on the Rhine. Austria is not a wine-producing country to an extent worth mentioning; yet some of the Hungarian wines are good. In descending the river from Molk, we soon came in sight of a spot of more than ordinary interest. The banks, which here rise to a considerable height, and are covered with wood, press close upon the stream, which seems to have cut its way through the ridges that strive to intercept its passage. On the summit of the lofty crags on the right bank stand the remains of Aggstein, a feudal fortress long since dismantled; and on the face of the arid cliffs on the left is seen the ruined castle of Durrenstein, which had been of con-

siderable size. Within these walls, now shattered, and open to the gaze of the passing tourist, Richard Cœur-de-Lion was confined for upwards of twelve months (1192-3) by Leopold, Duke of Austria, the unfortunate king having been treacherously seized at Vienna, in returning homewards as a pilgrim from the Holy Land. Immediately on passing the ridge on which Durrenstein is placed, the scenery altogether changes: the river, emerging from its lofty banks, rolls through a great plain, dotted over with woods; here and there a large and elegant building is observed; and beyond all, the hills far distant bounding the horizon. We have, in short, left the mountainous region, and entered on the plains of the lower Danube. From the midst of the green plain which first meets the eye rise the spires of Vienna; and landing at Nussdorf, a village on the right, where a number of carriages are in attendance, we reach in a quarter of an hour the capital of the Austrian empire.

In approaching Vienna, we lose sight of the Danube, which disappears from view between willow-clad banks and islands, the city proper being built on a small tributary—the Wien—which, from anything I saw, is little better than a foul and stagnant drain. Advancing towards the town, we pass through extensive suburbs, and finally emerge into an open space, grassy, and ornamented with trees, of the third of a mile in width; and on the opposite side of which stands Vienna, seemingly squeezed so hard within a high wall, that the houses look as if they were engaged in a desperate elbowing of each other, and about to burst their too tightly-drawn boundary. By a cavernous tunnel, which perforates the lofty wall and rampart, we reach the interior, and then find ourselves in streets narrow and winding, and lined with stone houses as high and spacious as those of Paris. We procured accommodation at the 'Archduke Charles'—a first-class hotel, according to the guide-books, but deficient in various accommodations. However, we had no great reason to complain, and remained in the town about a week; not time enough to do the sights justice, but as much as I could spare.

I have never been so fairly baffled by any city as I was by Vienna: such is its extraordinary jumble of streets, and so like are they to each other, that, till the last, I had considerable difficulty in finding my way. And yet there is a sort of plan by which the main thoroughfares are arranged. At the centre of the town stands the cathedral of St Stephens, an ancient and imposing edifice, with a lofty spire; and from this point the principal streets radiate to different portals in the bastions, whence they stretch far into the suburbs. There are, however, many cross and circuitous streets, a number of open places, and many closely-packed lanes and passages, forming short cuts from one great thoroughfare to another. The houses in the best streets are of enormous dimensions, all with inner courtyards, and of handsome and solid architecture. Excepting first-class mansions, the houses are occupied in floors by different families, the access being usually by common-stairs from the courtyards. A nobleman and man of literary distinction on whom I called lived on a second floor in a building of this kind; and a banking company with whom I did some business had their office on a floor higher up. The number of separate dwellings in some of these huge edifices astonishes those who are unacquainted with the common-stair system. From four to five hundred inhabitants, occupying floors, or parts of floors, in one building, is not unusual—a number, however, which can be matched in the more ancient parts of Edinburgh. Like all ancient cities, Vienna is ill provided with sewerage; and yet, strange to say, it is a remarkably cleanly town in external appearance—the generally light colour of the houses, and the absence of smoke, imparting a lively effect. That which is most seriously defective is the general want of side pavement for foot-passengers. The streets are well paved with square stones from side to side, the part near the houses and shops being very slightly in-

clined upwards, so that there is nothing to prevent carriages from crushing you up to the wall, or running you down—a misfortune the more likely to occur from the excessive narrowness of the thoroughfares. All this of course suggests that Vienna was built for that portion of mankind who ride in carriages, not for those whose inclination or means lead them to walk on foot. Nevertheless, much seems to be done to render the streets comfortable to poor as well as rich. Great expense is incurred for the stones with which they are laid. These stones are brought from the rocky banks of the Danube, below Linz, and I was informed that each costs a swanziger, or twentypence.

Whatever be the general incommodiousness of the streets, neither that nor anything else prevents them from being a scene of bustle and gaiety from morning till night. Well-dressed people are seen pouring along to enjoy themselves in the restaurants, or in the public gardens; equipages of the most splendid set-out dash past on airing excursions; and to add to the liveliness of the thoroughfares, many of the shops are distinguished by paintings outside representing some eminent personage—as the Queen of England, Prince Metternich, or the Archduke Charles. These portraits, which are full length, and well executed, are painted on shutters, which are open only during the day. No city is better provided with gardens, pleasure-grounds, and walks open to the people. Around the glacis, or rampart, there is a delightful promenade with seats, commanding fine views of the Vorstädte, or suburban new town, which rivals in elegance of architecture the best houses in Paris. The Volksgarten, situated close upon the city, is a spacious piece of ground, decorated with trees, shrubs, and flowers, laid out in agreeable walks, and furnished with coffee-houses, and arenas for bands of music. This garden was given to the people by the late emperor; and here, in the fine summer evenings, Strauss's band performs for hours. Nothing is paid for admittance. For lengthened promenading and driving there are the roads environing the suburbs; but besides these, and the cross paths leading to them, the Viennese have the Prater, a park on the north-east, which is several square miles in extent, richly wooded, and partly tenanted by deer. Parties of pleasure who desire a still wider range proceed to Schönbrunn, the seat of the emperor, at two or three miles distance. We spent a day in rambling through the grounds, and seeing the gaieties and curiosities of Schönbrunn, every place, the palace excepted, being open for the inspection and recreation of all comers. From a lofty ornamental structure on an eminence within the grounds, we had an excellent view of Vienna and its environs, and had the satisfaction of having pointed out by our guide the spots rendered historically interesting in the last siege of Vienna by the Turks (1683), when not alone Austria, but Christendom, was saved by the gallant John Sobieski. The spot occupied by the tent of Kara Mustapha, the Turkish general, is now marked by a church. Next day, in a large collection of antiquities in Vienna, we were shown the horse-tail standard and tent apparatus of Mustapha, who, it will be remembered, was strangled, by orders of the sultan, for not winning the battle.

In the course of our stay we visited a number of collections of pictures, museums, and other public show-places; but any notice of these would only tire the patience of the reader; and in truth the sight of them was tiring to myself, for one may be surfeited with pictures as with anything else. On Sunday we went to the chapel connected with the imperial palace, not to hear the music, finely as that was performed by a vocal and instrumental band, but to have a glimpse of the great nominal ruler of the nation: nor were we disappointed. The emperor entered about the middle of the service, and took his place in a small gallery without any fuss. He is a little man, with an unnaturally large forehead, diffident and mild in demeanour, and with the reputation of being one of the kindest-disposed

creatures in the world. He is generally in bad health, and takes little or no part in public affairs. The actual government, as is well known, has for many years been in the hands of Prince Metternich, a man of consummate abilities, though, like many statesmen, ignorant of the true foundations on which power can alone safely repose. The next place we visited was that to which the imperial family, after the splendours of the giddy and false world have passed away, are pompously carried to 'rot in state.' It is a spacious vault, situated beneath the church of a convent of capuchin friars; and under the guidance of one of the brotherhood, clothed in a brown tunic, with a rope round his waist, and a lamp in his hand, we descended a long flight of steps to this remarkable mausoleum. The apartment, which receives a little light and air from gratings, consists of several vaulted chambers, dry, and not unpleasant to the senses. What a melancholy spectacle! Rows of large sarcophagi of lead or zinc are ranged along the paved floor, and by the lamp of the monk we are enabled to read the inscriptions, which tell us that within repose the bodies of kings, queens, archdukes, emperors, and empresses. The largest and handsomest of these metal boxes is that which contains the remains of Maria Theresa, the greatest of all the Austrian rulers; but it is surpassed in value by the sarcophagus of Joseph I., which is of pure silver. We noticed also some small sarcophagi containing the remains of baby archdukes; and for a few moments, the lamp of the capuchin was held over the plain and unnoticeable sarcophagus in which reposes the body of the youthful and unfortunate Duke of Reichstadt, son of Napoleon. What an end to the hopes of a dynasty which was to rule half the world! The being ushered into existence with the firing of a hundred cannons successively at the Invalids, at the sound of which all Paris was frantic with joy—or pretended to be so—lies decomposing in a metal chest at Vienna, the groom of his chamber a nameless capuchin monk! We had better not ask what France now thinks of the Bonaparte family!

I did not quit Vienna without making some inquiries into the state of elementary instruction. In this matter it is but justice to say that Austria, with all its religious and political intolerance, is much in advance of nations possessing greater freedom. Education in its primary branches is universally established, and as far as I saw, is conducted on a liberal footing. I visited an academy which serves as a model for provincial seminaries. It is accommodated in a building of considerable size, each floor being divided into several spacious halls, opening on corridors. The resident director, an aged gentleman, to whom I introduced myself, politely conducted me through the establishment, explaining everything as it occurred. The method of teaching is explanatory, with the use of the black board. The number of children attending this school was fifteen hundred, all boys, divided into juvenile and advanced classes, each class under one master, and occupying a separate apartment. The routine of instruction embraced reading, writing, arithmetic, drawing, and mathematics. It was pleasing to observe the decorum and quietness which prevailed throughout the establishment. On our entering and retiring from each class-room, all the pupils rose and bowed: and this was no sham reverence. On the dismissal of one of the classes, the pupils crowded around my venerable conductor, and with terms of endearment covered his hand with kisses.

It is absurd and presumptuous for a traveller who rushes through a country to philosophise very deeply on its social condition; yet a man is entitled to at least use his eyes and ears wherever his destiny carries him, and to form his impressions accordingly. My notion, then, from all I saw in Vienna and elsewhere, is, that Austria, though under a pure despotism, is not uncared for morally, physically, or intellectually. I saw, however, only the best part of the empire—that in which the land is owned in portions of reasonable extent, and below which portions it is not allowed to be

divided. In Hungary, the form of society and territorial possession is very different. Admitting much that was presented to our view to be far from unpleasant, I felt that the entire system was hollow and unnatural, and could not last. Mankind are not destined to be for ever managed as if they were children. Passing circumstances prove that Austria has been under a gross mistake in imagining that it is either safe or just to keep its people in tutelage an instant beyond the time they can think and act for themselves. For the military and police oppressions in the conquered provinces—for the heartless proscriptions and imprisonments at Venice and Spielberg—the day of reckoning has already to all appearance arrived.*

W. C.

L'HOMME CHARMANT.

So accessible were the ancient Greeks to visual impressions, and so enthusiastic in their admiration of beauty, as well as of gracefulness of form and movement, that even the sage Areopagites were obliged to listen in obscurity to the pleadings of their celebrated orators, lest, unwittingly, their judgments might receive a favourable bias towards some handsome speaker; or, on the other hand, lest they might prejudice the cause of one less happily endowed with personal attractions.

The love of the beautiful is not less instinctive in humanity than the appreciation of goodness, or the reverence for truth; and when found in harmonious combination with these—its kindred faculties—we can scarcely estimate too highly the blessing of having an eye and a heart open to delight in all that is graceful and lovely, whether in animate or inanimate creation. Even where this admiration of Beauty seems to exist a little out of its due proportion, we would gladly excuse the error, knowing how mighty and how magic is its sway; and also how vain it is to expect a perfect development of every good and noble faculty in the same human soul.

Among no modern people is the homage rendered to beauty more enthusiastic than among the Parisians, who have often been compared in this and other respects to the Athenians of old; and truly in many points the resemblance seems complete, though we stay not here to trace it out: we have at present to do only with their admiration of beauty, which they are wont to express by a single word—*charmant*—a dissyllable significant not only of beauty, but of a thousand nameless attractions, which, clustering around personal grace of form, make it tenfold more lovely and beloved. It is a word not altogether unknown to our own language, although in its insular rendering it is perhaps less refined in its shade of popular meaning than in the French language. It is somewhat singular, too, that among us the word is more frequently applied to man than to the gentler sex. Which of us have not known among the circle of our acquaintance a 'charming man?' Whether it be the literary coterie, the fashionable world, or the professedly-religious circle, each society can boast of its charming man—one who is handsome, clever, and agreeable; who is usually more plausible than profound; more commonly the admired acquaintance of all, than the tried and trusted friend of any. The career of the charming man is not always a satisfactory one, inasmuch as popularity has its appointed limits; and the idol of to-day is too often the outcast of to-morrow. Nor is dame Fortune less capricious in her favours than the giddy multitude; for occasionally she delights to snap asunder the golden threads of some brilliant destiny, and show how frail at best are the bonds by which happiness and humanity are linked together in this our lower world.

Such was the case with a personage whom we are about to introduce to our readers as a most perfect spe-

cimen—not of a 'charming man,' but of '*un homme charmant*;' one who, about seventy years ago, was idolised in that character by the fastidious people of the French capital.

Although Monsieur de Létorières (the person of whom we speak) was simply a French gentleman of Xaintonge, whose only wealth on setting out in life was his trusty sword, yet in the eyes of an English reader his history may derive additional interest from the circumstance of his relationship with the House of Hanover, through the marriage of his aunt, Mademoiselle D'Olbreuse, with George William, Duke of Brunswick, whose only daughter became the unhappy wife of George, Elector of Hanover, and was thus the ancestress of our present royal family.

The early youth of Lancelot-Joseph de Létorières was passed at the college of Plessis, where he had been placed by his uncle, the Abbé du Vighan; but finding his vacations too short, and his studies too long, the impatient youth escaped from college, and hastened to the capital, where he found himself as free as air, but dwelling in an empty garret. Whenever he suffered from cold or hunger, he left his solitary apartment, and descending into the gay and crowded streets of Paris, forgot his wants, and thought himself, for a while, the happiest being in existence.

One of his early friends used to relate that M. de Létorières having left his lodging one cold winter's day, to recreate himself among the busy haunts of men, he was overtaken by a pelting shower of rain, and took refuge from the storm beneath an archway. Meanwhile a hackney-coach passes slowly along, and the driver looking earnestly at him, inquires—'Shall I drive you, sir, across this stream of water?'

'No, thank you,' replies the handsome youth, looking somewhat sad.

'If you want to go farther, sir, I can take you to any part of the city you please.'

'I was only going to walk in the Galleries of the Palais de Justice, but I mean to wait here until the rain is over.'

'What! under that cold archway?'

'I have no money to throw away in coach-hire, so go away, and leave me in peace.'

'Sir,' replied the coachman, jumping off his box, and opening the carriage door, 'it shall never be said that I allowed so handsome a young gentleman as you are to *enoyer* yourself here, and to catch cold into the bargain, for the sake of twenty-four sous. It is all on my way to pass by the Palais Marchand, so, if you please, I will set you down there, close to the image of St Pierre.' The gracious offer was accepted.

On opening the carriage door at the entrance to this celebrated *traiteur's*, the coachman respectfully took off his felt hat, and begging of the youth to accept a *louisd'or* from him, said, 'You may have occasion for it in there, sir, and you can find me out any time you please, and repay me at your convenience. The number of my coach is 144.'

The name of this good-natured man was Sicard. He was an honest, worthy fellow, and through the recommendation of M. de Létorières, ended by being coachman to the Princess Sophia of France. Whenever any one alluded to his liberal conduct towards M. de Létorières, he was wont to answer, that any one else in his place would have done just the same; 'for,' added he, 'he was so charming a young gentleman, that one might almost have mistaken him for an angel.'

Another time his tailor's wife, growing impatient about a debt of four hundred francs, which he had owed for a considerable time, rated her husband soundly for not insisting on his rights. 'What a chicken-hearted being thou art!' exclaimed she, 'and all, forsooth, out of complaisance to Monsieur le Charmant!' (for so was he nicknamed in the family). 'As for thee, thou hast not courage to show him thy teeth; but I will soon settle the matter with him. I am going forthwith to his lodging, and you shall see if I come away empty-

* This article was written some weeks previous to the late overthrow of affairs in Vienna.

handed. Charming as he is, I will manage him properly. Let me alone for that.'

No sooner had this resolute woman returned home, than her husband, perceiving that she looked rather crestfallen, inquired where was the money which had been paid to her by M. de Létorières.

'Come, come, you must not worry me; but the truth of the matter is, that on going into his room, I found him playing the guitar, and he looked so sweet and gentle, that I could not find it in my heart to annoy him in any way.'

'And the four hundred francs?' resumed the tailor, looking at her rather sarcastically.

'My good friend,' replied his imperious spouse in the meekest tone imaginable, 'you must only enter them on your books; and you may as well at the same time add three hundred more to the account, for there was something so melancholy, so—I don't know what to call it—about him, that I could not help taking one hundred crowns out of my pocket, and in spite of his refusal, I left them on his chimney-piece.'

As soon as M. de Létorières had completed his twenty-first year, he brought his family papers to M. Chérin,* from whom he speedily obtained the certificate necessary for his presentation at court. When walking one day in the gardens at Versailles, the king took notice of him, and having learned from his courtiers who the handsome gentleman was, he inquired of his counsellor Chérin, 'Of what family, pray, is the Poitou gentleman, named Létorières, whom I see about here?'

Chérin replied that the young man's pedigree, although noble, was not such as to entitle him to ride in the king's carriages, for his proofs were not altogether—

'But,' interrupted the king, 'he is *charmant; vraiment charmant*; and I desire that he may be presented to me with the title of vicomte.'

So Chérin inscribed him on his register as having a certificate *by command*; and the Vicomte de Létorières shared at once all the honours of the court.

Whenever he was concerned in any appeals to the tribunal of the point of honour,† his adversaries were sure to be obliged to offer their apology to him, and to make exorbitant reparations, which was attributed to the gracious and fascinating manner in which he had solicited *Nosseigneurs les Maréchaux*. He gained every lawsuit in which he was interested, among others an important one against the Dukes of Brunswick-Oëls, on the subject of some property which had belonged to his grandaunt and their grandmother D'Oibreuse, to whom we have already made allusion.

'He is like the serpent of Paradise,' observed Monsieur de Beaumont, the archbishop of Paris; 'and if ever he has an affair with the officiality‡ of Paris, I will take care to have him masked with a monk's cowl and frock, lest he should beguile his judges.'

The feeling of admiration and interest excited by M. de Létorières became at length so universal, that sometimes on his appearing in public he was greeted with acclamations by the multitude. An eye-witness thus describes his reception at a sacred concert which was given in the theatre on Shrove Tuesday 1772:—'M. de Létorières was only just recovering from a sword-wound received in a duel with the Comte de Melun. When he heard the popular acclamations, he rose in his box, and looked around him on the house with an air

of perplexity and surprise, as if it were impossible for him to suppose that he could be the object of applause, which is usually reserved for favourite actors or for royal personages. This inquiring gaze was full of the easy and simple gracefulness which characterised his every movement, and it drew forth still livelier demonstrations of pleasure from the multitude. He wore on that evening a suit of rich *moiré* straw-coloured silk, with facings of golden tissue, shot with emerald green. The knotted band on his shoulder was green and gold, and his Steinkerque belt was clasped with emeralds. The buttons of his coat were formed of opals set in brilliants, and the handle of his sword was similarly ornamented. Moreover, his coiffure consisted of two tufts of waving curls, sprinkled with light-coloured powder, and falling gracefully upon the collar of his dress. A soft and humid brilliancy sparkled in his eyes, which were a thousand times brighter than the costly jewels which he wore. In short, I was obliged to confess that I had never before seen a being who was so truly charming.'

It is almost needless to say that M. de Létorières, so popular among all classes and conditions of people, was a favourite with the *beaux sexe*. Among the court beauties was one, however, who more especially won his attentions, and who returned his love with all the ardour of youthful enthusiasm. Victoire-Julie de Savoie-Carignan was a naïve and lovely young creature, whose princely family being suspicious of her attachment to the charming vicomte, and conceiving that an alliance with him would be unsuitable to her rank, obliged her to become an inmate of the Abbaye de Montmartre, where she was virtually a prisoner; for although treated with the utmost deference and respect, all her movements were under the surveillance of a guard of the provost-marshal's office. In spite of these precautions, she attempted to maintain a correspondence with her lover; but their communications were discovered, and the result was a challenge to the vicomte from one of her relations, the Baron d'Ugeon. Just at this time Louis XV. was attacked by the smallpox in its most virulent form, and our Gaius of Xaintonge had obtained leave to shut himself up with his royal master, and tend him during his illness. The permission thus granted gave great offence to the courtiers, who carried their absurd passion for etiquette even to the very gates of the grave, and were displeased at this close attendance upon royalty by one who had not previously enjoyed the *entrée* into the king's chamber. Louis XV. died, and M. de Létorières came out of the infected palace only to meet his challenger in single combat. The Baron d'Ugeon inflicted on him two severe wounds in the right side, and he was carried home in a precarious state. He was, however, carefully tended by a friendly surgeon, who gave out that his patient was suffering from smallpox, and could not therefore receive any visits. After a while, there seemed to be every prospect of M. de Létorières's recovery, when through his impatience to seek an interview with Mademoiselle de Soissons, he left his house before his wounds were thoroughly healed; and having, by means of liberal bribes, obtained admittance within the walls of Montmartre, he met his betrothed under the arched arcade which led from the cloister to the cemetery. Their interview was brief. She hastened back to her honourable prison, little dreaming that she had for the last time beheld her charming friend, who was found a few hours afterwards, stiff and cold, upon the pavement of the cloister. It seems that the emotion excited by meeting Mademoiselle de Soissons after so long a separation had opened his wounds afresh, and he died alone on this gloomy spot, unaccompanied and unseen by any human being.

Thus perished, in the prime of life, he who was confessedly the most exquisite model of *un homme charmant* that had ever been beheld in the Parisian world. Already had he not only won the good graces of a fastidious public, and subdued the heart of a high-born

* Monsieur Bernard Chérin was a very important personage at the French court, as it belonged to him, in his capacity of genealogist of the king's house and of the court of France, to investigate the proofs of nobility of all those who desired to be presented at court, and also the higher pretensions of others, whose ancient and exalted ancestry entitled them to the honour of a seat in the king's carriages.

† In the reign of Louis XIV., duels had become so prevalent among the young nobles of Paris, that a special tribunal was appointed to take cognizance of offences which did not fall under the rule of ordinary courts of law, and for a time it was effectual in restraining the rage for this species of single combat.

‡ An ecclesiastical tribunal.

beauty, but he had likewise acquired, with almost unparalleled rapidity, wealth and honours which might have satisfied his utmost cupidity and ambition.

Just before the demise of Louis XV., he had been created by that monarch Marquis de Létorières and D'Olbreuse. He was also appointed *Mestre de camp* of cavalry, Commander of the united orders of Saint Lazarus and N. D. du Mont Carmel, Grand Sénéchal d'Aunis, &c. &c. He had, moreover, become the proprietor of millions of francs. But his titles perished with him; his wealth was swallowed up by creditors and lawyers; and the princess, whose favour had proved so fatal to him, before the expiration of many years, had wedded into the ducal House of Cobourg.

Thus brief and evanescent was the brilliant career of this fascinating Parisian.

MUSIC AS A BRANCH OF EDUCATION.

THE Chinese tell us that the heart, after trying in vain to express its emotions, first by words, and then by sighs, bursts at length into song. This is not only poetical, but likewise philosophically true. Music undoubtedly is, in its elements, a natural means of expressing feelings, and even ideas—in short, a kind of language. Yet, while springing essentially from inherent powers of the mind, it quickly becomes an art, and one capable of exercising no small influence over human beings. As an art, it ranks with rhetoric and painting, and it is thus identified with civilising and refining agencies. It is nevertheless remarkable that, in certain stages of society, these processes are balked of their true purpose and effect. Artists become enervated as they advance; musicians, poets, painters, sink into idleness and dissipation; and their divine art, through the weakness of its professors, falls into reprobation or contempt. This is not confined to our country. In China, India, Persia, the very same revolution has occurred that we have ourselves witnessed in northern Europe. In England and Scotland, the resulting prejudice appears to have continued after the cause has given way before the general advancement of civilisation; but in the latter country, it is strengthened by the sectarianism which was engendered amid the struggles of the Reformation, and which retains to this day a portion of the old iconoclastic spirit. Here all kinds of music but psalm tunes are regarded by a considerable class of the people with coldness, if not suspicion; and the art has consequently sunk into a state of degradation not known at a much earlier period of our history. A change, however, appears now to be in progress; and it begins where it ought—among the young; who will grow up, it is to be supposed, not worse Christians for having imbibed in their early years a taste for music, and a feeling of its beauty and power. In Edinburgh, many hundred children, under the direction of Dr Mainzer, are daily familiarised with the choral strains of the best masters of the art; and these children will operate like so many ducts, spreading the holy influence of music throughout the whole bosom of society.

We are led into this train of reflection by a work just published by the gentleman whose name we have mentioned, and which we think is deserving of the attention of our readers. It is an examination of the merits of music as a branch of education, and contains an interesting sketch of the history of the art.*

Dr Mainzer repeats various stories of the effect of musical sounds, such as that of the lady known by Rousseau, who could not hear any kind of music without involuntary and convulsive laughter. This, however, was probably owing to nothing more than a morbid condition of the nerves; such as made Mozart, when a violent blast of a trumpet struck upon his delicate ear, fall senseless to the ground. The effect on animals is popularly known; although we may mention the dog referred to in the *Musical Gazette* of Leipzig, who was so much excited by a composition in E major, that on

an occasion when the experiment was continued too long, he became furious, and died in convulsions. Inanimate objects are likewise moved, in some mysterious way, by sound. Glasses, mirrors, china, are said to vibrate and break at certain notes of the flute, or of the human voice; and some pipes of the organ make the windows, walls, and pillars of a cathedral shake.

The most powerful effect of music, however, is due to its adjuncts and associations. The call which accompanies the heaving of the lead is extremely simple; but when heard at midnight on the sea, it is indescribably solemn. The bell of a village church is laden with beautiful and touching recollections. A melody familiar to us in childhood, is for ever after linked in our imagination with the things and persons most dear to our memory. The 'Ranz des Vaches' is little more than a signal played by a shepherd on a cow's horn; and 'Erin go bragh,' and 'Lochaber no more,' would have but slight effect upon the ear, if their associations did not touch the heart. Still, the air being born of the feeling, must be adapted for its expression; and hence the simplicity of national songs as music, and their powerful influence upon the affections. 'If we examine,' says Dr Mainzer, 'all those melodies which have produced extraordinary effects upon individuals, upon multitudes or nations, and thus have acquired historical importance, we shall find that their power is not derived from science or artistical combination, but is founded in truth, nature, and simplicity. These are the great engines of influence in musical composition and performance. It is a power more frequently found in melodies of popular and instinctive origin than in works of art; or, if met with in the latter, it is because those same qualities are predominant. In the scientific and difficult, the musician, the composer, as well as the performer, will be admired; but it is by his simplest strains that he will captivate and subdue his hearer, that he will reach his deeper affections. Whenever we find a melody in the mouth of a whole nation, whenever an air is heard that produces strong feelings of excitement or dependency, we may be certain that it stands away from the refinements of art, and is powerful in its effects in proportion to its simplicity.'

To this he adds the association of the two sister arts; poetry giving vigour and distinctness to the language of music. 'What music wanted in thought, it received from the poet; what to poetry was unattainable in feeling, charm, and transport, the musician supplied in his turn.' This association was constant among the ancients, whose earlier bards were likewise musicians and singers. The later bards and scalds, the troubadours and minstrels, likewise united the two arts; and 'sacred were those songs,' as Herder says, 'in which the people learnt the history, the traditions, and, with them, the language and manners of their nation.' This appears to be everywhere characteristic of a particular stage of society; and our ingenious author would be interested to read in Colonel Tod's 'Annals of Rajasthan,' that the Rajpoot chiefs of the present day learn, like the European lords of the middle ages, the deeds and genealogies of their ancestors from the songs of their family bards. In the middle ages, the British islands were more especially celebrated for the harp; and seven hundred years ago, Scotland is described by Geraldus the Cambrian as 'the fountain of the art.'

We have no room to follow Dr Mainzer in the curious erudition with which he has adorned his subject. He shows clearly the connection of music with education, both classical and popular; and combats successfully the notion, that its cultivation has 'no native soil in the British islands.' As for the vulgar objection to the art on account of the disoluteness of some of its professors, he expends far too much trouble on so paltry a subject. It is sufficient to say that he attributes the low character of musicians to the fact of their being mere musicians—that is to say, to their deficiency in general education. On the usual musical education of young ladies he is especially severe. 'To study music

* Music and Education. By Dr Mainzer. Longmans, London.

is to them nothing but to learn to play the *piano*. You may have talent, or you may have none, you must learn it, under penalty of being taxed with having received but an indifferent education. In what, then, consists this study of the piano? In sitting so many hours daily before the instrument, having the fingers curved, and stretched, and trained; and after having thus passed, in the most tedious and thoughtless of all studies, the most precious and invaluable hours of life, what knowledge has been acquired? Have they become musicians for their pains? Has the science of music been revealed to them? Have they learned to understand, to judge, to analyse a musical composition in its technical construction and poetical essence? Or have they learned to produce, after their own impulse, a musical thought, to develop it, and, in a momentaneous inspiration, to make the heart speak in joyful or plaintive strains, according to their mood of mind? Nothing of the kind. A few have learned to play a sonata, perhaps a concerto; a greater number have reached variations, but by far the greatest majority only quadrilles! This playing of quadrilles, this training of the fingers, mothers complacently call accomplishment, a refined education; and musicians who look with contempt upon musical study and musical works of this description, can they be surprised when the art to which they have devoted themselves is not appreciated, not understood? What can we expect, when its whole destiny is left in the hands of matrons of boarding-schools, who generally are clear-sighted enough to make it an important item of their business, withdraw the lion's part from what is due to the teacher, but are ignorant of its very alphabet? Parents, however, share with the matrons the reprobation of our enthusiast; and he declares to the former that it will be impossible to change so degrading a system, unless they themselves show a better understanding and a higher appreciation of the art. At present, we are in our musical infancy, with variations, songs, duets, and trios dinning for ever in our ears. 'What sacrifices, what hours, what precious years are wasted in the acquisition and practice of a kind of composition, which, in reality, belongs only to what we might call the musical infirmities and excrescences! Such compositions are the productions of musical merchants, written for the market, and calculated upon the ignorance of the customers. The distance of such a musician to a Palestrina, a Handel, a Mozart, can only be measured by that from an *ignis fatuus* to one of the luminaries of the ether above us. In them is spirit, enthusiasm, and poetry. Whoever approaches the sphere in which they breathe, feels himself elevated, and upon the wings of genius carried away into other zones, other climes, more congenial with the spiritual, the immortal man. There he lives with a Raphael, a Schiller, a Mozart, in the regions of the ideal; and tastes, in those moments of light and purity, joys which the world can neither grant nor take away, which no recollection can either darken or efface.' But how can the great choral and orchestral compositions—ranking with historical works in painting, and temples and cathedrals in architecture—be brought within our reach? The elements, it is answered, for raising music from its lowest to its highest station are around us, in every school, and every institution; and if we only make use of these elements, we might be able to say with Zelter, 'our chorus is now nothing less than a vast organ, which I can set a-playing or stop with one movement of my hand, and can make it, like a telegraph, denote and express great thoughts; an organ, every pipe of which is a rational voluntary agent, and which may realise our highest conception. Our choir is a school, whose end is wisdom, whose means poetry, harmony, and song.'

This brings us to the most practically important part of the volume—the consideration of vocal music. That the exercise of the voice in singing is conducive to health, no one now doubts; but our author asserts that it develops and cultivates the sense of hearing, and thus produces, so to speak, a musical ear. Childhood he

considers the fittest period for this education of the faculties, when all the organs of the voice are soft and flexible, and when the ear receives and conveys sound with facility. 'The earliest age—that of six or seven years—is the most appropriate for learning to sing; voice and ear, so obedient to external impressions, are rapidly developed and improved, defects corrected, and musical capabilities awakened. Experience of many years, and observation of every-day's occurrence, have taught us that a considerable proportion of the numerous children with whom we have met could at first neither sound a single note, nor distinguish one from another; yet all, without exception, have acquired ear and voice, and some of them have even become superior in both to their apparently more gifted companions; in others, the very weak or indifferent voices have in a short time become pleasing, strong, clear, and extended. Children from five to six years of age, some of them unacquainted with the letters of the alphabet, have learnt to read music, to a considerable extent, in unison and parts, and to sing, with astonishing precision, imitations and fugues of Hiller, Rink, Fuchs, Telemann, and other great masters. So thoroughly acquainted have they become with the pitch of sound, that, without the least hesitation, they name the notes of which melodious phrases are composed, as soon as sung or played; and it is remarkable that in this exercise the youngest, and those who had at first to contend with the greatest difficulties, appeared the most acute and ready.' Some children, destitute of ear, acquire the faculty in a few days, while others take weeks or months.

If the time is allowed to pass proper for forming an ear, calling forth a voice, and inspiring a love for music, the teacher's difficulties are surmountable only by zeal, perseverance, and natural talent in the pupil. 'Throughout life, the difference between a musician from infancy, and one from more mature age, will be visible at a glance. The latter may possess musical knowledge and taste; the former will possess both, with deeper musical feeling, more power, and greater certainty of judgment. In the one, music will be an acquirement; in the other, a feeling, a new sense interwoven with the constitution, a second nature. With children, the teacher has a power of creation; with adults, he is dependent on circumstances; he educates in the one case, in the other he has to amend the defects of education.' It is likewise dangerous to the health to strain the voice of an adult unaccustomed to the exertion; but besides this physical difficulty, there is the still more formidable one arising from the mechanical habits of mind induced by the soulless drudgery of the piano. Here the pupils do not learn music, but mechanical brilliance. They do not feel or understand what they play any more than a musical snuff-box, and yet for this barren accomplishment they sacrifice the best years of their life. With them, 'the principal object of the teacher must be to draw the attention to the more poetical part of music; to explain the variety of form, the difference of character and style, and the consequent expression in the performance of solo compositions. Thus he may still succeed in imparting, as far as practicable, a thorough knowledge of its theory and practice, and at the same time cultivate the taste and judgment that are so indispensable for understanding and enjoying works of art.'

But to the poorer classes music is of far greater importance than to any other, as an elevating and noble substitute for grosser pleasures; since dissipation in such classes arises commonly, as has been stated before parliament, from the want of rational enjoyments, and especially from the intellectual destitution of the female part of the population.

The musical education, Dr Mainzer thinks, should commence in infant schools, where children should learn little melodies, in poetry and music, and sing only by heart. In schools of children, again, from seven to twelve years of age, 'singing at sight must become as general as reading the mother tongue.' When this is

the case, the style of music will grow with the child till it reaches that which gives it its lofty destiny—domestic or family music. 'In a country where dramatic works have so long and so exclusively occupied the field, it is difficult to make it understood what family, what domestic music is. In the expectation that this style of composition would soon find poets and musicians, we might mention as such, the smaller pieces of Handel and Mozart, the psalms of Marcellus; or, should we name the work of a more modern master, those beautiful duets of Rinck, called, in the English translation, "The Sabbath Eve." In the character of these simple musical dialogues, of which the English poet has unfortunately too much contracted the thought, is our idea of one kind of family music best personified. They have that sublime cast, that lofty tone and sentiment, which mark this kind of music as the most cheering, the most elevating. Who once has been a witness of the magic charm thrown over a family by the true and expressive interpretation of such simple compositions; who has seen what a little paradise rises, as by enchantment, out of the few inspired strains of the poet-musician, will ever forget what an endless ocean rolls its waves between the every-day compositions, and works, such as we understand them, and as we would fain see them domesticated under every roof, at every fireside?'

But Dr Mainzer does not dogmatise as to schools and methods. 'Teach! teach!' that is his cry. Let the labourers work as they please; give full scope to competition; encourage talent; and throw wide open the gates of instruction. 'The educational and family music, scarcely known as yet by name, will, in the midst of an ocean, in all its various changes and tempests, stand in its simplicity, purity, and grandeur like a rock, and bear unshaken the sway of all the surrounding tides of style and fashion. There will be a music which appears neither upon the stage nor the market-place, neither in concerts nor drawing-rooms, but which modestly enlivens the school and the cottage, and helps to instruct the people, to embellish the hour of toil and that of rest. Thus music will again be looked at with reverence. In churches she will fill, like a stream, the hearts of the multitude; she will again appear as the minstrel and the harp of old in our dwelling; be our guardian angel, a heavenly messenger, our teacher, friend, and comforter; and from her deepest dejection, from a state of servitude, corruption, and degeneracy, rise, a new Phoenix out of ashes, higher and higher to a glorious apotheosis.'

Such is our author's *finale*; and in closing the volume, we feel that, during its perusal, we have been drawn into the vortex of its amiable enthusiasm. The work is dedicated to the members of the Educational Institute of Scotland; but we hope its circulation will go far beyond even that extensive body, and that, as a treatise introductory to family music, it will become a family book.

CHANGE OF AIR.

An occasional change of air may be said to be almost necessary to the perfect wellbeing of every man. The workman must leave his workshop, the student his library, and the lawyer his office, or sooner or later his health will pay the penalty; and this, no matter how great his temperance in eating and drinking—no matter how vigorously and regularly he uses his limbs—no matter how open, and dry, and free from sources of impurity may be the air of the place in which he is employed. In the slightest cases of impaired health, the sleeping in the suburbs of the town in which the life is chiefly spent, or even the spending a few hours of detached days in some accessible rural district, at a few miles' distance from the dwelling, may suffice to restore the healthy balance of the bodily functions, and maintain the bodily machine in a fit state for its duties; or in cases of somewhat more urgency, or of somewhat more aggravated character, a more decided change of air, for even a few days, once or twice a year, may suffice to adjust or restore the due economy of the system.—*Robertson on Diet and Regimen.*

THE ROBIN REDBREASTS' CHORUS.

[There is an old English belief, that when a sick person is about to depart, a chorus of Robin Redbreasts raise their plaintive songs near the house of death.]

THE summer sweets had passed away, with many a heart-throb sore,

For warning voices said that *she* would ne'er see summer more;
But still I hoped—'gainst hope itself—and at the autumn tide,
With joy I marked returning strength, while watching by her side.

But dreary winter and his blasts came with redoubled gloom,
With trembling hands the Christmas boughs I hung around the room;

For gone the warmth of autumn days—her life was on the wane;
Those Christmas boughs at Candlemas I took not down again!

One day a Robin Redbreast came unto the casement near,
She loved its soft and plaintive note, which few unmoved can hear;
But on each and successive day this redbreast ceased not bringing
Other Robins, till a chorus full and rich was singing.

Then, then I knew that death was nigh, and slowly stalking on;
I gazed with speechless agony on our beloved one;
No tearful eye, no fluttering mien, such sorrow durst betray—
We tried to soothe each parting pang of nature's last decay.

The blessed Sabbath morning came, the last *she* ever saw;
And I had read of Jesus' love, of God's eternal law,
Amid the distant silver chime of Sunday bells sweet ringing—
Amid a chorus rich and full of Robin Redbreasts singing!

The grass waves high, the fields are green, which skirt the church-
yard side,
Where charnel vaults with massive walls their slumbering inmates
hide;

The ancient trees cast shadows broad, the sparkling waters leap,
And still the Redbreast sings around *her* long and dreamless sleep.

C. A. M. W.

* Evergreens hung about on Christmas eve, ought to be taken down on the 3d February—Candlemas-day—according to old usage.

AN EXEMPLARY LANDED PROPRIETOR.

The following account of the improvement and thorough change of character of the estate of Bogbain, near Tain, lately appeared in the *Ross-shire 'Advertiser'*; and shows what vast changes for the better may be made on waste lands by the application of capital guided by enterprise and skill. When the proprietor, Mr Kennedy, purchased Bogbain in 1836, it might be said to be almost in a state of nature. The yield of corn that year amounted to five small stacks, while this year we counted in the corn-yard nearly 100 large stacks of wheat, barley, and oats, besides an immense stack of hay. There are 80 acres under turnips, 25 of which are Swedish, and each acre of the latter will, it is expected, produce from 35 to 40 tons. The arable land is now subdivided, and enclosed with thriving hedges and wire fences into parks of from 28 to 30 acres each—all in one beautiful sheet—comprising about 340 acres, trenched 22 inches deep, all tile-drained 15 feet asunder. The main drains are built with stone, with covers of freestone 3 inches thick. A large space of from 40 to 50 acres, which formerly was a lake of from 5 to 8 feet deep, is now the most fertile and productive spot on the estate. The canals (one of which is 4000 yards long, and from 5 to 9 feet deep) carry the whole water off the property, are covered so far as the arable land extends, and afterwards merge through the plantations, which are also all thorough drained, and are emptied in the romantic Loch Oigh. The soil of Bogbain is of a fine sharp loam and clayey nature, with a southern exposure, well sheltered, and mostly level, the highest part not being above 80 feet above the level of the sea. There are no public roads passing through the estate, except the approach to the residence. The farm-steading are of the first class, the greater part of which have been erected by the proprietor. The trenching, draining, roads, and fencing at Bogbain, with other improvements, have cost Mr Kennedy upwards of £16,000, who, till lately (when the improvements were so far completed), annually employed from 100 to 150 labourers. The plantations on the estate extended from 350 to 400 acres, consisting of hardwood, fir, and larch. There is a regular nursery, in which are reared all sorts of forest trees.

YOUTH AND AGE.

HUMAN life is a series of developments, and at each new period some new power is unfolded; new experiences are likewise added: by which means not only are old prejudices frequently corrected, but the errors of our former conduct exposed, condemned, and punished. During the earlier epochs of our existence, we are impelled by dim instincts with such impetuosity as permits small opportunity for reflection—a time, however, at length arrives when the man comes to a pause, and reverts his contemplation on the path which he has so far traversed. How much, in the haste of the transit, has been overlooked and neglected—how much injured and defaced—how many mistakes have been committed—how many wrongs inflicted and suffered! Then follows the usual exclamation—'If my time were to come over again, how differently would I have acted! But ah! it is too late now!' And so the man commences again his swift career, hurrying afresh onward, and still onward, pursued by remorse and fear, until he reaches the goal—the grave.

Meditating these facts, we are sometimes tempted to believe, that if the prudence of age could be added to the impulse of youth, a great advantage might be gained for the individual. But a difficulty exists against blending them in one and the same person. Happy, however, is the man who benefits by the dear-bought experience of his elders; who, duly influenced by the example of those who are not only aged, but also good and wise, has learned, without suffering, what to avoid, and what to pursue. The counsel of a sage mentor in a parent, grandfather, or great-uncle, cannot fail of being advantageous in many important respects; but on the other hand, there are many counterbalancing disadvantages: the young are enterprising—the old prefer safety to victory, peace to anxiety. In advising youth, old persons accordingly regard rather the dangers to be escaped than the object to be attained. This, in the way of caution, may, must be well; but if it amounts to coercion, even in the slightest degree, it cannot fail to have evil consequences. If, instead of persuading or guiding the judgment, it should substitute a control upon the volition of the young, it will fatally preclude action, stopping it at its very source. We have not, in such a case, combination, but mere displacement: young impulse is altogether put aside, and antique prudence takes exclusive possession.

The caution of age should be used for the regulation, not for the annihilation, of the impulsive instincts of the ardent and juvenile. Another danger, too, arises. Antique prudence may be *obsolete* prudence; circumstances may so have changed, as to make it the reverse of prudence at all. The world of commerce affords

abundant instances of this, particularly in firms of long standing. A young man of good abilities, full of vigour, becomes, for instance, by right of birth, a junior partner in an old-established business, and deems his fortune made. But in a few years, the concern, to the surprise of all, sinks and perishes. The surprise is the greater, because, in the world's estimation, the house was always considered particularly safe. It meddled not with modern speculations, it relied on an exceedingly old connection, it did no business that it was not sure of—yet it failed. In fact, though it risked no losses, it achieved no gains; and thus in the end suffered more than it would have done from bad debts or mistaken speculations. Meanwhile let us imagine, or rather simply state—for we record facts—the position of the junior in the firm. What was it? Anything more distressing could scarcely be conceived. From the first he was powerless. He found an established method—a system of routine to which he was compelled to adhere. Of an enlightened understanding, and an enterprising spirit, he at first attempted innovation, and aimed at those sources of profit of which more youthful firms availed themselves; but was met so uniformly by the fixed habits and rooted prejudices of the older partners, that at length he succumbed to necessity, and fell himself, for the sake of peace, into the customary channels. Had he commenced business on his own account—thrown himself entirely on his own energies and resources, and been at once inspired by hope, and controlled by prudence, he would in all probability have achieved brilliant success.

Youth is proverbially rash, but the aged may show an equally dangerous rashness in holding doggedly to old and worn-out notions. Accustomed to venerate what has existed for generations without challenge, the older class of persons are prone to oppose the slightest attempt at modification, and they suffer accordingly. Many a warning, in the course of events, is received; yet age is obstinate, and persists in the old course—not because it is right, but because it is old. The association of ideas, sympathy, determination of character, a sense of pride, while it recognises the peril, and other like motives, induce age to disregard the symptoms, and inspire it with courage to endure martyrdom, rather than incur the shame of a submission to change. Thus the inveterate controversialist will not confess a proven truth though convinced; falsely apprehending as a defeat what, if candidly acknowledged, would be really a triumph, he wins a ruinous conquest, and wears a counterfeit laurel. Can we take up a newspaper without being made conscious of the hideous train of disasters which have ensued in various European countries from a rash and unphilosophic persistency in what ought to have been long since modified and accommodated to the spirit of the

age? The energies of France, outgrowing the routine of old dynasties, require a new electoral system: being refused, the nation indignantly dissolves the partnership between her and the sovereign. Such are the evils which flow from the substitution of the merely regulative for the dynamic forces themselves.

The last illustration presents the topic under a graver aspect than it was our intention to have considered. Thus drawn, however, to the subject, we cannot refrain from remarking how often we hear that said with pride regarding institutions and systems, which, rightly regarded, should be otherwise spoken of. 'Thus long has stood this system without one iota of change—here, as we stood centuries ago, do we yet stand—what was thought and professed then, is still thought and professed. Change has often been called for, but never granted; so that here, at least, we have one monument of the past that has never bent to the inconstant wind of human caprice.' If such a thing really exist in the world—which is gravely to be doubted—assuredly this is a questionable boast. The minds of masses of men being liable to a continual, though it may be slow and imperceptible change, it is impossible for any institution to go on unchangingly, without falling out of relation with the world. Its vital is changed for a nominal existence; and so far from deriving strength from its antiquity, it derives weakness and danger. Institutions of this kind may be flattered, up to the last day of their existence, with the external homage which they have been accustomed to receive, and ere four-and-twenty hours pass, they may be trampled on as noxious weeds, or quietly consigned to universal forgetfulness. Such catastrophes are clearly traceable to the error of setting up persistency as the law of the world, the real law being change. Man continually changes, and everything that would wish to live with him must consent to change too: everything must partake of his eternal rejuvenescence, or take the consequences of becoming too old.

It is the instinct and tendency of youth to transcend the limits of its actual experience. It presumes, assumes, idealises, colours from its own rich heart the outlines and forms of things, and anticipates results with a prophetic power that sometimes induces their realisation, but more frequently clothes the distant prospect with those enchantments which Hope pictures as belonging to the future. Youth is the season of æreal castle-building—of countless projects—of boundless aspirations—of infinite possibilities. But a period of limitation at length arrives—of aims more and more positive, objects more definite, an arena more contracted, and labours more special. The man has become the class-man—the cosmopolite, or the patriot—the general lover, or an attached husband and father—the acquaintance of all, or the friend of a few—the wanderer of the clubs, or the domestic man, whom nothing can tempt from his chimney-corner on a winter's evening. Much has been gained, but evidently much has been lost. While the difficulty of blending in one individuality the advantages of both conditions is freely acknowledged to be great, we are far from holding it to be insuperable. There is much needless waste of wealth, much extravagance of anticipation, much borrowing on the credit of the future, much excess of all kinds, on which it would be well that youth should be timeously admonished. With all the regulations of experience, however, it is of equal importance, individually, and for social wellbeing, that the middle-aged and old should cultivate as far as possible youthful feelings. Let not 'the glory and the freshness of the dream' of youth depart with the dream

itself, some glimpses of the vision may surely survive in memory. 'Once more,' exclaims Byron, 'who would not be a boy?' To 'carry the feelings of childhood into the powers of manhood is,' says Coleridge, 'the prerogative of genius.' And what a prerogative it is! Yet it is not one so exclusively that all men may not share in it, each in his degree. We would warn, therefore, the man of middle age from becoming the victim of fixed habits and acquired routine, to the exclusion of new impulses, and the pleasure that constantly attends them. Every day is a new day, every hour a new hour: the world is always becoming new, and creation is renewed every moment, so that nature is still in travail with fresh generations. Nothing, if we rightly consider it, is really old—not even age itself. To insist on guiding ourselves by the prejudices of yesterday, is merely to resist the progress of growth. Judgment, in its maturity, has nothing to dread from concession to increased knowledge. Its tendency is to deliberate—to move slowly—to stand still; and it indeed needs the agitation of new ideas, interests, and opinions, to preserve it in a healthy state of life and action. An old man of our acquaintance, who as solicitously sought the instruction of new impressions, as others are anxious to reject them, declared to us that, as his understanding became more and more illuminated, he felt as if he was growing younger every day: it was, moreover, evident to all that his intellect, owing to the freedom with which he had permitted it still to operate, was constantly to the last receiving fresh development and expansion. Happy the man thus united to an aged body, who yet owns a young mind! His are at once the security of discretion and the rapture of imagination—this sobered in its tone, and that vivified—and both coexisting in beauty, like light and shade in the picture of a great master.

THE CORAL-FISHERS OF TORRE DEL GRECO.

A STORY.

I AM a man who has the rare faculty of 'walking with his eyes open.' I believe I learned it in my youth from a little story entitled 'Eyes or no Eyes.' The author's name has escaped my memory; but that matters little, since the influence of his or her writings has rested there ever since, probably influencing my character to a degree of which I am myself unconscious. After all, is not this an author's best immortality? Thus always looking beneath the surface of things, I peer into a man's face for his character; examine his general mien for his fortunes or occupation; amuse myself in the most incongruously-mingled crowd by framing little fanciful histories for each member of it; and pry into life and its curiosities something after the fashion of a geologist. At times I turn up only rugged stones, but now and then a precious jewel, thanking Heaven which sent me among the rocks and crannies of life—a moral geologist.

Following my usual fantasy—I can hardly call it a pursuit—I stood on the shore at Torre del Greco one bright morning in March, when the *tramontana** had 'crept into its cave,' and the beautiful Bay of Naples lay, all peace and sunshine, beneath the cloudless Italian sky. I was watching a little fleet of boats that seemed about to depart; they were just trying their sails, after the manner of a flock of young goslings, when first dipping into their native element. I was stranger enough in the land to wonder why so many fishing-boats were making sail at once, and asked the question of a lazy sunburnt lad, half sailor half beggar, who lolled beside me.

'*Santa bergine!* does not the signor know? The coral-fishery begins to-day; these are the boats; the fishermen are just coming down from Torre.'

'How gay they look!' I said, as a troop of mariners, all dressed in their best, and fluttering with ribbons, came down to the beach. Most of them were young;

* A stormy periodical wind.

many had the striking peasant-beauty which seems natural to an Italian clime. 'The coral-fishery must be a merry life,' I continued.

'It is the life of a dog!' observed the young lazzarone, stretching himself, as if exulting in his own laziness.

'Then why do those young fellows seem so merry?'

'Oh, signor, it is their first season: they do not know what is before them. I tried it once; but the man who goes two seasons to the coral-fishery is mad or a fool—that is, if he lives through the first. I had rather starve on shore than be worked to death at sea.'

I tried to get some explanation from my young acquaintance respecting the hardships of the fishery; but his disgust appeared to be so great, that I could elicit nothing, except a repetition of the fact, that it was '*la vita d'un cane*.' I thought that the life of the lazzarone himself seemed of a very canine and half-civilised character, and could hardly imagine one that was worse; so I left him, and watched the fishermen enter their boats. They were accompanied to the shore by a number of peasant women; and as I drew nearer, and looked in the faces of these mothers, sisters, betrothed wives perhaps, I found that my speculations, founded on the gay ribbons and holiday appearances, were, to say the least of them, as fictitious as such fanciful pictures generally are.

One soon begins to individualise in a crowd, choosing out those who seem most worthy to be made the foundation of some romantic superstructure. My fancy lighted on a young pair who appeared superior to the rest, certainly not in dress, but in an indescribable something of air and mien that is best expressed by the term 'interesting.' I took an interest in them accordingly; and hidden by a shore-driven boat, used my eyes, and—shall I confess it?—my ears too, with infinite pleasure. It did them no harm, poor souls! What was I to them, or they to me, save that their loving looks, their ill-suppressed tears, their lingering embraces, touched a chord in a heart which, perforce, has learned from such sympathies to still its individual throbs, and to beat only in unison with the great pulse of human nature.

'Bertina, *mia cara*,' whispered the young fisherman, 'it is only a summer, a short summer. What is that to the long life before us—a life spent together? The feast of San Michele will soon come, and then the fishery is over, and the fifty ducats will be gained. Think of this, Bertina!'

'Ah, Ippolite!' sobbed the girl, 'how can you talk of fifty ducats, which must seem nothing to you, though it is a great sum to me. But I have been poor all my life, while you— Oh, Ippolite! I wish—I wish you had never loved me, and then Madonna Guiditta would not have been angry, and you would not be perilling your life for the sake of fifty ducats. Go back to her now, and tell her that you will not marry me, and that I will promise to go away and never see you more.'

'You are very unkind, Bertina,' the young fisherman answered; 'but it is too late now. I thought of your doing this, so I got the money in advance, and now I am obliged to go, and I am glad of it. I shall never return to my sister again; and if you leave me, the fishes in the coral beds may take Ippolite Sacchi, for all that he cares.'

As he spoke, the girl clung around him, and stopped his words with her tearful embrace. They never seemed to see their companions, only each other, although many a compassionate eye was directed towards them as well as mine. 'God help them, poor souls!' I said to myself: 'there is trouble here, as there is all over the world, wherever love comes.' As the fishermen embarked, the crowd of lamenting women shut out from my sight Ippolite and his Bertina, so that I did not see their parting. Many of the women fell on their knees, and old their rosaries in silence; while others took handfuls of sand, which they threw after the receding boats, saying, '*Possio dare come nave degli angeli!*'—('May it

sail like a bark freighted with angels!') It was a superstition of love and piety: I could not even smile at it.

When the women turned to go home, I saw one of them still standing, as motionless as a marble statue, gazing after the boats. It was the girl Bertina. I looked at her wistfully.

'Poor thing!' murmured a voice behind me. I was almost startled at the gentleness of its tones, seeing that they came from my young lazzarone. Well, one sometimes finds a grain of gold-dust in a bed of coarse sand. There was good in the lad, with all his dirt and laziness: I began to like him.

'Why are you so sorry for that young girl?' I said. 'She is not worse off than all the other women who have sent their friends to the fishery.' This was a *ruse* of mine: it succeeded admirably.

'I wonder the signor is not ashamed to speak so unfeelingly,' said the lad, becoming energetic and angry at once. 'But it is always so with the cold-hearted *Inglese*' (English). 'Who would not be sorry for poor Bertina, when all the town knows that she ought to have married Ippolite Sacchi in peace and happiness, and gone to live at the pretty vineyard on the side of Vesuvius, if it had not been for— But I beg the signor's pardon for running on thus,' interrupted he.

Now, if there is one thing which a Neapolitan beggar likes better than lolling in the sun and eating macaroni, it is a gossip, when he can have all the talk on his own side. I knew the lad was longing to tell as much as I to hear; but with that spice of cunning which makes newsmongers and news-seekers coquet with each other, we mutually tried to deceive ourselves—he and I pretended just so much indifference as brought out the story in all its completeness. Despairing of ever conveying in English the inimitable sketch which the lazzarone gave—enriched by his energetic attitudes, his expressive patois—I will endeavour to furnish a condensation of this historiette.

Ippolite Sacchi had been brought up from the cradle by his half-sister, Madonna Guiditta, his elder by some twenty years. All the love which some hidden fate had forbidden to expend itself in other ways, was concentrated on this boy. He was her pet, her plaything, her pride. She loved him with a love 'passing the love of women.' All their father's property had been left exclusively her own, to the prejudice of little Ippolite; but his sister never married; 'because no one would have her,' my lazzarone observed. I thought, and am now sure, that he was mistaken. However, Madonna Guiditta, miser and devotee as she was, and consequently disliked by everybody, was yet almost like a mother to the young Ippolite, until he grew up, and excited her ire by falling in love!

'Look at Bertina yourself, signor,' continued my informant, 'and see if he could help it! A sweeter and better girl never lived, though she is only a poor vine-dresser. Madonna Guiditta was ashamed to call her sister, though every one else thought the shame was on the other side. The ugly old woman was so proud of her riches, and expected Ippolite to marry some one better than a poor village girl. She told him to choose between his sister and Bertina—to live and be the heir of the vineyard, or be turned out without a *danaro*. He chose Bertina, as who would not? and was turned away.'

'And did he marry her?'

'How could he, signor, when they had not a ducat between them? So he went to the coral-fishery, and poor Bertina is left to work alone, until they both get money to marry upon. Heigho! it is better to be a lazzarone, and do nothing. Will the signor give me a *danaro* for amusing him?'

'Human nature is human nature after all,' I thought; so I gave him the coin, and was turning away, when he pulled me by the sleeve.

'See, signor, there is Madonna Guiditta come to look after the boats I suppose. I wonder she is not ashamed to see her own brother, whom she pretended

to be so fond of, among the coral-fishers. Ugh! there she stands, *la donnaccione*!

It is impossible to give the full effect of this purely Italian word, as the lad used it, accompanied by a meaning shrug: it implied all that was ugly, contemptible, and abhorrent in female nature. I looked at her to whom he applied it. She was a tall, thin woman, certainly the reverse of beautiful; but yet the time might have been when the roundness of youth softened her large, strongly-marked features, and the benign influence of a happy and loving heart made them almost pleasing. We should not judge harshly of any one. I almost pitied her when I saw the expression of wild sorrow in her dark eyes, how they were strained to distinguish the distant white sails, that looked like floating sea-birds in the bay.

'She creeps along, that no one may see her: she is ashamed, and well she may,' moralised the lazzarone—'that poor Bertina there is happier than she. I wonder if they see one another?'

Apparently they did not, for Bertina sat under the shelter of a sand-hill, with her face buried in her lap, and the sister of Ippolite seemed to see nothing but the vessel that was bearing to labour and danger the youth who had been her darling for so many years.

At last the white sails disappeared, and Guiditta turned to leave the beach. Bertina also rose up, and the eyes of the two women met. The younger one was weeping bitterly; at the sight, the passing softness which had come over Madona Guiditta was changed into anger. How dared a mean peasant girl even to weep for *her brother*? She cast on Bertina a look of the bitterest scorn and jealousy, and swept away, leaving the poor maiden humbled to the dust. The young vine-dresser waited until Ippolite's proud sister had passed out of sight, and then crept away, to toil and to grieve for her lover.

Many a time during the summer that I stayed at Torre del Greco, a vague interest led me to follow the steps of both Ippolite's sister and his betrothed. Very winning was the latter, with her gentle beauty, her patient toil, her faithful love, which found a brief reward when, every fortnight or three weeks, the boats put in from the fishery, and Ippolite leaped on shore for a few tender words, a few half-weeping caresses, which lightened his labour, and made him seem to suffer less from the hardships of the coral-fishery than those who had no loving aim to reach at last. Still, they were young, and love alone is happiness. My heart clung more to that lonely woman, whose only refuge was her pride. Erring as she was, I pitied Madona Guiditta more than I did those whom she had caused to suffer—for who knew what bitterness might have drunk up the fount of love, which so rarely runs dry in a woman's heart! She had sinned; but who is it that the angels in heaven weep over—the injured righteous, or the sinner?

My little lazzarone, Pietro, met me occasionally on the sands, and presuming on the easiness of an idle man, often began to talk—chiefly about those in whom I took an interest—as his quick perception soon found out, and of which his natural cunning took advantage. Many a stray *soldo* did the young scapegrace wile out of my pockets by his stories about Madona Guiditta and the pretty Bertina—how the father of the latter had been a young man well-to-do in the world, but had ruined himself by his extravagance—and how Guiditta's father had helped him, and would have done more for him, had he not married Bertina's mother, a low servant girl. I did not believe the half of what Pietro told me, and yet I wished it had been true. I put together the disjointed fragments, and framed a little romance—the romance of a dreamer. It half atoned for the harshness of that desolate woman, and so I cherished it, for I would ever fain believe in the best side of humanity.

The feast of San Michele is the time when all the coral boats come on shore, whether fully laden or not;

and the fishery is ended. No threats will induce the sailors to work another day after that blessed time of relief has arrived. The continued hard labour, the want of sleep, and the bad food, which are the unfailing portion of the coral-fishers, took effect in time even upon the youth and strength of Ippolite Sacchi. His bright and hopeful eyes grew dim; and when, about a month before the feast of San Michele, his boat put into shore, I saw that a great change had come over him.

'It is the last voyage, indeed the last,' I heard him whisper to his betrothed, as the same evening they came down to the boat together. 'A little more patience, Bertina, dearest, and I shall have earned the money, and then we will be married. With your care, I shall be quite strong against the vine season comes; and tending the grapes will be delicious—quite like play—after working at the coral-fishery.'

'Alas, alas! that you should have to work at all, my Ippolite!' answered the girl, kissing his delicate hands, now hard and embrowned by labour. 'Oh that I had the strength of a man, that I might work for you! It breaks my heart to think that I am the cause of all this—I who would give my life to save you one care.'

I was a fool—I know I was; and yet there was something in that girl's love that made my eyes run over. I hid myself behind the hillock where they sat, and watched her as she laid his weary head on her shoulder, and parted his long damp hair: I could bear it no longer, but crept away—

'Love's pain is very sweet.'

Why is it that we envy and long for even its sufferings, rather than the desolation of its utter absence?

On the eve of San Michele, all the other boats crowded into the harbour of Torre del Greco like a swarm of white butterflies—all except the little vessel of Ippolite Sacchi. I was down on the beach, mingling with the crowd. I did not see Bertina there; for the vintage season had already begun, and the young vine-dresser could not spare an hour from labour, not even for the sake of love. I was rather glad that she was absent: it would have been a sore pain to that tender heart to witness all the happy greetings, while she herself had to endure the bitterness of suspense. At the time, no one thought anything of this temporary delay in the arrival of one boat; but as the night passed, and the feast of San Michele dawned, while the little bark was still absent, many from the town of Torre came down to the beach with fear and anxiety in their countenances. There were other anguish-riven hearts besides that of Bertina.

All that day I looked in vain for my little Mercury of good or evil tidings—Pietro the lazzarone. He had quite disappeared from his accustomed haunts. I watched the various merry groups and processions, half-festive, half-religious, which hailed the return of the coral-fishers; but in the midst of all, my mind often reverted to the poor Bertina, sorrowing unseen, perhaps alone and unpitied; and more often than even to her did my mind revert to the vineyard on the side of Vesuvius, where one more wretched still abided. I had an idea that Pietro's absence was in some sort connected with these two; and it was a positive relief to me when, at the close of the day, I saw him traversing the beach with a restless haste that contrasted strongly with his usual lounging gait.

'Good news runs fast, Pietro,' said I: 'where are you carrying yours?'

The lad turned round and made his usual salutation; but the broad stereotyped smile of a Neapolitan lazzarone contended with an expression of sorrow, which made him look comical in the midst of his evident grief. 'The signor's condescension would almost turn bad news to good,' he answered, with an attempt at his usual cajoling. But it would not do: the poor lad had a heart in his bosom beneath those paltry rags, and the tears stood in his black eyes as he added, 'Oh, signor, do not

stop me; I am going to poor Bertina with the news about Ippolite Sacchi!

'What news? Is the boat come?'

'Alas, no, signor! But a fishing-smack has brought the news that it was seen three days ago foundering in the midst of a storm off the Barbary coast. There is little hope that poor Bertina will ever see her betrothed again.'

'And you are going to tell her so?'

'No one else will; and she may bear it best from me—for Ippolite always liked me—he was always kind, for I was an orphan like himself—and she knows I would have done anything on earth for him.'

'And where are you going to find her, Pietro?'

'At the church. She is sure to be at vespers, praying for him, poor girl. Good evening to the signor!' And Pietro scampered on, his bare brown feet hardly leaving a trace in the sands.

I could not control my own steps; insensibly they brought me to the church: I had kept Pietro in sight until he disappeared at the door. Then I felt in my very heart what was passing within; I almost heard the scream of that widowed maiden, as his terrible news met her ear. Yet I could not prevent myself from entering the church.

It was almost empty. Throughout the day many happy hearts had poured out their thankful orisons—for in Catholic countries religion is mingled with every passing event of daily life—but these had gone away: it was only mourners who came to pray and weep. Through the sombre twilight, which always reigns in foreign churches, I saw one figure kneeling—no, less kneeling than prostrate on the floor. I knew it was Bertina, and that she had heard all. Pietro was not beside her; he was advancing with an angry vehemence towards another worshipper at a little distance—a woman covered with a hood. The lazzarone touched her dress, and she drew it away, as if from contamination. But in another moment a shriek, wild as that I had expected from the patient, mute, sorrowing Bertina, disturbed the quiet of the church. Pietro had told Madona Guiditta of her brother's fate. It struck her like a thunderbolt: she fell on the marble pavement half insensible. A century of agony and conscience-stricken remorse must have been comprised in that one moment.

When Madona Guiditta lifted up her head, Bertina had risen from her knees. The two women looked at one another for an instant, and then Ippolite's sister opened her arms; the girl threw herself into them, and all pride, all enmity was forgotten—one common grief had united them, one all-sanctifying love for him who was gone. Ippolite's sister and his betrothed went away together; the elder mourner leaning on the arm of the younger, guided by her, and seeming to look to her with all the helplessness with which an aged mother clings to her child. The proud woman was completely shattered by the blow.

I turned homeward, moralising, after my usual habit, on what I had seen. How often it is the stern rod of affliction which strikes the rock, and the waters flow! And who shall say that the hand which deals the stroke is not a merciful one? It was so now for both those desolate ones. Yet that poor Ippolite! Well, let us not ponder too much on these things, but look to the end of all.

'What has become of Madona Guiditta and Bertina?' I inquired of Pietro, when, after an absence of some time, I met him on the beach.

The lad broke into a broader smile than ordinary. 'Oh, they are living together in the beautiful vineyard. Madona Guiditta is growing quite fond of her poor brother's pretty bride—the Virgin pardon her sins! But if the old wretch had come to her senses a little sooner, poor Ippolite would not be feeding the fishes off the Barbary shore, nor Bertina pining her life away, as I know she is, though she smiles and looks cheerful for the sake of her lover's sister. A fine sister indeed! no

more like Ippolite than'—a brilliant idea crossed the mind of the young beggar—'than this ragged old jacket to the beautiful new one which I could buy if the signor would only give me a few soldi.'

'At the old trade again, Pietro,' I said, trying to look angry, while a slight movement made the coins jingle in my pocket, and reminded me that the bitter equinoctial winds were just beginning to blow, and the lad's brown skin peeped out at the holes in his shadowy apology for a coat. 'It is a sin to encourage idleness,' whispered Prudence, but Compassion put her sweet lips to my ear, and murmured, 'How hard were poverty and orphanhood combined!' Somehow, Pietro got the soldi.

'So, Madona Guiditta is really kind to the poor girl?' I pursued.

'Oh yes, signor; as kind as such an old creature can be. At first she seemed as if she could hardly bear to look at Bertina, but now she sits whole hours watching her; and I have often peeped through the vines, when they were sitting together, and seen Madona Guiditta take Bertina's head between her two hands—ugly brown withered hands they seemed beside those soft cheeks—and look into her face, muttering to herself for minutes together. The old woman may well look too; for poor Bertina's was once the prettiest face ever seen, and the very image of her father's, who was the handsomest fellow in Naples, people said. But the Signor Inglese can take little interest in these things.'

I nodded, but did not farther detain my young informant. As I walked on, it was with a thoughtful spirit. Another leaf in the great tablet of the human heart had been unfolded before me through these unconscious revelations. They set me pondering for a long time. As we advance in life, we philosophise where we once used only to feel. I was on the boundary of the two crises, and my meditations savoured a little of both.

As the winter drew on, I began to experience the weariness of an aimless life. The subsiding of the passing interest which the little episode I relate had given me perhaps increased this feeling. My strolls about Torre seemed to have a painful uniformity, so I projected a journey up the mountain. Perhaps some vague remembrance of Bertina, and of the vineyard on Vesuvius, which seemed a very paradise to the little lazzarone, was the unconscious reason of my choosing this direction for my peregrinations. If so, the same chance led me thither; for one day, at the commencement of a sudden storm, such as are peculiar to the region, I found myself seeking shelter at a dwelling which fully answered Pietro's description.

While I speculated on this, the door opened, and I was courteously welcomed in by a voice which I knew well, though it was the first time its accents had ever been addressed to myself. I soon found myself sitting face to face with Madona Guiditta and Bertina. Little did either know how well the stranger had read the hearts and the destiny of both. I watched them eagerly. A change had come over Ippolite's sister; the harsh lines in her face had melted away. When she looked at, or spoke to Bertina especially, there was a sweetness in her countenance that made me remember with surprise Pietro's epithet of 'donnaceina.' But most of all did I marvel at the patient calmness of Bertina's face—a calmness which seemed the very sublimation of grief. Then I knew how great and holy is the love which survives even the parting of death, and through its intensity conquers even that last despair.

I was almost glad that the storm continued, so that I had an excuse for remaining; but I was not exactly pleased when the shaggy head of Pietro the lazzarone peeped in at the door. Madona Guiditta turned away with an expression of pain, but Bertina went and spoke to the lad with her own kind tones. Pietro seemed unusually restless, though a continual succession of furtive smiles appeared creeping about his mouth. At last he came close to Bertina, and whispered something that made her start and turn pale.

'What is it? Oh, mother of mercy! what is it?' she uttered tremulously.

The lad's eyes wandered uneasily towards the door. 'Don't be frightened, Madona Bertina; it is nothing—only the boat—the boat: I can't keep it any longer!' cried the boy, bursting into a caper of frantic joy, that nearly overthrew the table and myself too. 'Ippolite is come back!'

He was indeed! for the next instant he darted into the room, and snatched to his arms—ah, the first embrace was not the sister's, but the beloved Bertina's! Even then a pang seemed to shoot through Guiditta's heart, since, when Ippolite left his betrothed to fall on the neck of his sister, she only kissed his brow, said softly, 'Thank God,' and glided out of their presence. The happy ones never thought of this—how could they know it!

A short time after, Madona Guiditta returned. Bertina and Ippolite looked anxiously towards her, and the girl half withdrew herself from the loving arm of her betrothed. But there was no cause for doubt in that serene, affectionate, though half-mournful face.

'Bertina, the Virgin has heard our prayers,' she said. 'My brother, welcome home! Forget all the past, as I do. Ippolite, bring to me my sister!'

During that silent embrace I and Pietro crept out of the room. We had no business there.

I do not think I shall ever see Torre del Greco again, though I shall carry with me all my life a pleasant memory of the summer I spent there. But it is very unlikely that I shall ever be allowed to forget the place, since I have an active and faithful Italian servant, who has followed me half over Europe, and who keeps perpetually reminding me of the beauty of a particular vineyard on Mount Vesuvius. He never urges me to go there, except by picturing the happiness my presence would give.

'And the signor always likes to please other people rather than himself,' the fellow adds sometimes.

Sly Pietro! I should not wonder if you had your own way after all.

THE LAW OF RIOTS.

It used to be said that the people had nothing to do with the laws but to obey them; but even if this were true, one would think that the people would have some curiosity to know what the laws really are which it is their duty to obey. The law, however, in this country, as regards the masses of the population, is a sealed book, committed to the charge of the lawyers; and to them all without the pale of the profession look for its interpretation. Offences are daily committed, of which the perpetrators know not even the name, far less the penalty; and we constantly read in the newspapers, and think it a capital joke, that a certain offender—to his great astonishment—was 'locked up!'

Something of this, no doubt, is owing to the equivocal nature of the laws themselves, which appear to be expressly constructed to serve as a bone of contention for the lawyers; and something, likewise, to their prodigious number, which would demand the exclusive study of many years—and then, for the most part, elude the inquirer. But still there are circumstances of life, circumstances of constant recurrence, upon which it would be as easy as it would be advantageous to know the true bearing of the law; and to this extent, at least, it is not too much to expect that men anxious both to walk in safety themselves, and discharge their active duty as citizens of the commonwealth, would devote a small share of their attention. In this idea, various cheap works have been printed of late years, explaining the law of debtor and creditor, landlord and tenant, and so on; but we have now one before us on a subject

still more urgent at the present moment—the LAW OF RIOTS.*

What is a riot? Mr Wise, collating the old standard authorities, and the suggestions of the Criminal Law Commissioners, gives this definition:—'A riot is where three or more persons are assembled together without the authority of the law, and engaged in the actual execution of a joint design of a private nature, with violence, and to the terror of the people.' The word 'private' here should more strictly be *local*, and it is used to distinguish the offence from high treason; but at all events, it is clear that three persons may commit a riot as completely as three thousand. Fewer cannot do so, any more than one person can be guilty of conspiracy.

As for the *personnel* of the riot, it may consist of men, women, or infants. Infants at common law are under fourteen: above that age, they are punishable as persons of full years, while under it the penalty depends upon the opinions of the jury as to the extent of their knowledge that they were doing wrong. Women being held to be rioters as well as men, are punishable in their own persons; and husbands may take the flattering unction to their souls, which is offered to them with becoming gravity by the text-books, that they are *not* to be flogged for their wives' misconduct.

The object of the riot is of no manner of consequence, the purpose of the law being simply to prevent violence and tumult, under whatever pretence. If three or more persons, for instance, indignant at a manifestly illegal enclosure, combine to destroy it, they are rioters if they do so in the terms of the definition we have given. The indictment charges no specific purpose: it is the illegal combination, even for a legal object, which constitutes the riot. An *accidental* affray, however violent and terrifying, is no riot; although a lawfully-assembled meeting may become riotous, if they proceed to execute their purpose with violence.

A conspiracy, an unlawful assembly, and a riot, are three distinct offences. The first may exist in its purpose alone—that of effecting any object, legal or illegal, by unlawful means; the second may likewise be without aggressive acts, only *threatening* danger to the peace of the neighbourhood; while a riot is constituted by the offenders being in the actual and violent execution of their project. Of these three, the 'unlawful assembly' would seem to be the grand difficulty. We can tell at once whether the means used by conspirators are legal or otherwise; and about the nature of a riot there can be no doubt: but it is a very delicate task to interfere with the free expression of public opinion, by declaring that a certain meeting of the people is likely to prove dangerous to the peace. Still, there is generally room for a very tolerable presumption. If the meeting expresses, beyond any doubt, the will of the whole kingdom, the question of illegality is at an end; but if, on the other hand, it is merely the voice of a certain portion of the people, who endeavour, by the intimidation of numbers, or physical force, to overawe the authorities, it should unquestionably be put down as unlawful. In order to determine its character, we must weigh all the circumstances of the case; for we are by no means to be governed by the opinion of timid or excitable persons. We must consider the apparent *animus* of the leaders, as disclosed in their speeches, the time, place, and manner of the meeting, and the state of the public

* The Law Relating to Riots and Unlawful Assemblies, &c. By Edward Wise, Esq. London: Shaw and Sons, Fetter Lane.

mind at the time—whether temperate and rational, or likely to be moved by the pressure of circumstances to extravagance, recklessness, and revolt. A careful consideration of these things by firm and reasoning men, will leave little place for error.

It is said, in our author's definition, that a riot must occasion 'terror to the people;' but the people may be represented by one man. If a single one of the Queen's subjects is terrified, that is enough; although the averment as to terror—in *terrorem populi*—is essential to the validity of the indictment. In an otherwise perfectly clear case, where this allegation was omitted, it was held that the defendants could not be convicted of riot. It is unnecessary, however, that the terror should be realised, for personal violence is not an indispensable ingredient in a riot.

Who is guilty of riot? This, it will presently be seen, is a most important question, and must be answered as distinctly as possible. If the meeting be a legal one, and a riot ensues, those only who actually take part in the riot are guilty; but if the meeting be in itself for an unlawful purpose, all attending it countenance the illegal design. Knowing the meeting to be illegal, prudent persons ought either to absent themselves, or assist in dispersing it. If they do neither, they are at least an obstruction to the peace-officers, and so far accomplices of the rioters. It is vain for a member of that illegal meeting to say, that although he approved of the purpose, he did not approve of the violence; for the act of a single individual in such circumstances is construed to be the act of all, and the military, when it is proper for them to act, would be justified in firing upon the whole mob. A mob riotously burned a building; but one of the persons apprehended was proved not to have been present at the commencement of the fire, and it was therefore argued that he could not be guilty as principal. The offence, however, was not destroying the house by fire, but riotously assembling, and while the riot continued, demolishing the house; and the prisoner was found guilty, and transported for twenty-one years. The punishment for simple riots is fine and imprisonment, with or without hard labour; and for aggravated riots, in which houses or other property are destroyed, transportation for life, or for any term not less than seven years, or imprisonment for any time not exceeding three years; and solitary imprisonment, not exceeding one month at any one time, or three months in any one year, may also be inflicted.

The enactments familiarly called the Riot Act were made at the time when the newly-seated House of Hanover was distracted by popular tumults, and they are of course distinguished by much severity. The first section declares that all persons, to the number of twelve or more, who continue riotously assembled for one hour after proclamation is made (termed reading the Riot Act), shall be adjudged felons, and suffer death, as in case of felony, without benefit of clergy. The punishment has since then, as we have seen, been modified,* but the other provisions are strictly enforced. When the proclamation is to be made, says the act, 'the justice of the peace, or other person authorised by this act to make the said proclamation, shall, among the said rioters, or as near to them as he can safely come, with a loud voice command, or cause to be commanded, silence to be while proclamation is making; and after that, shall openly, and with loud voice, make, or cause to be made, proclamation in these or words like in effect:—“Our Sovereign Lord the King [Queen] chargeth and commandeth all persons, being assembled, immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in the act made in the first year of King George, for preventing tumults and riotous

assemblies. God save the King [Queen].” And every such justice and justices of the peace, the act continues, ‘sheriff, under-sheriff, mayor, bailiff, and other head officer aforesaid, within the limits of their respective jurisdictions, are hereby authorised, empowered, and required, on notice or knowledge of any such unlawful, riotous, and tumultuous assembly, to resort to the place where such unlawful, riotous, and tumultuous assembly shall be, of persons to the number of twelve or more, and there to make, or cause to be made, proclamation in manner aforesaid.’ So strictly are these formalities of the proclamation observed, that in a case where ‘God save the King’ (now ‘the Queen’) was omitted, and in another where the additional words ‘of the reign of’ after ‘the first years’ were introduced, it was decided that the indictment must fail.

It is further enacted that any opposition to the reading of the proclamation—‘opposing, obstructing, letting, hindering, or hurting’ the persons reading or attempting to read—shall be considered as grave an offence as the remaining for an hour after it is read; and likewise that if the reading is prevented by such hindrances, those of the rioters who are aware of the fact shall be considered as guilty as if the proclamation had really been made. We frequently hear of the Riot Act being read more than once; but this is merely in order that there shall be no doubt as to the fact, not to give the offenders more time, as is commonly supposed, for the computation of the hour of grace is made from the first reading. This statute, however, is merely cumulative. The magistrates remain possessed of all their powers for the suppression of crime; and rioters who think that the proclamation gives them the right to do as they please for an hour without interference, will find themselves prodigiously mistaken. The act extends to Scotland.

The rights and duties of private individuals during a riot are perfectly clear and simple, although the great body of the people, we apprehend, know very little about them. ‘By the common law,’ says Lord Chief-Justice Tindal, ‘every private person may lawfully endeavour of his own authority, and without any warrant or sanction of the magistrate, to suppress a riot by every means in his power. He may disperse, or assist in dispersing, those who are assembled; he may stay those who are engaged in it from executing their purpose; he may stop and prevent others whom he shall see coming up from joining the rest; and not only has he the authority, but it is his bounden duty, as a good subject of the king, to perform this to the utmost of his ability. If the riot be general and dangerous, he may arm himself against the evil doers to keep the peace.’ But although the law not only permits, but enjoins this interference, it is considered more ‘discreet’ for private persons to range themselves on the side of the authorities; yet ‘if the occasion demands immediate action, and no opportunity is given for procuring the advice or sanction of the magistrate, it is the duty of every subject to act for himself, and upon his own responsibility, in suppressing a riotous and tumultuous assembly; and he may be assured, that whatever is honestly done by him in the execution of that object, will be supported and justified by the common law.’

It follows from the right to quell such disturbances by force, that rioters are held criminally liable for the consequences of their resistance. If a life is sacrificed by such resistance, this is murder; and the deed of one person, as we have already said, being chargeable upon all his aiders and abettors, the whole mob is guilty of the capital felony. But private persons have not only the right to interfere—it is their duty to assist the authorities when called upon. Obedience is compulsory, under pain of fine and imprisonment; the refusal, like the riot itself, being a misdemeanour.

When a riot is apprehended, too serious to be dealt with by the ordinary police force, special constables are summoned from the inhabitants of the district, and ‘sworn in.’ The oath is as follows:—‘I, A. B., do swear

* In a conviction under the Riot Act, the minimum of transportation is not seven years, as in ordinary cases of riot, but fifteen.

that I will well and truly serve our Sovereign Lord the King [Queen] in the office of special constable for the parish [or township] of —, without favour or affection, malice or ill-will; and that I will, to the best of my power, cause the peace to be kept and preserved, and prevent all offences against the persons and properties of his majesty's subjects; and that while I continue to hold the said office, I will, to the best of my skill and knowledge, discharge all the duties thereof faithfully according to law—So help me God.' The persons summoned to take this oath must obey, under a penalty not exceeding L.5. We have no room to describe the rights and duties of special constables, but they are identical with those of common law constables. They receive no salaries, but may be ordered allowances out of the county rate. 'Such,' says Mr Wise, in concluding the chapter he has devoted to them, 'are the provisions made by law for the preservation of peace and order by the civic guard, as they may be termed—a guard including within it all classes, binding all with equal rights, imposing upon all equal duties, because all have the deepest interest in protecting each other. So will they best protect themselves, and hand down that freedom to their posterity which their ancestors have acquired, of which the imperfection can be corrected by earnest inquiry and manly energy, but not by wild violence, nor by each class seeking to attribute all their own difficulties to the faults of others, and not caring to think how far they may have been the architects of their own misfortunes.'

The rights and duties of the military in cases of riot appear to be very generally misapprehended. 'The soldier,' says a high authority, 'is still a citizen, lying under the same obligation, and invested with the same authority to preserve the peace of the king as any other subject. If the one is bound to attend the call of the civil magistrate, so also is the soldier; if the one may interfere for that purpose when the occasion demands it, without the requisition of the magistrate, so may the other too; if the one may employ arms for that purpose, where arms are necessary, the soldier may do the same.' The military, in fact, are called out simply as that class of citizens whose services are likely to prove most efficient.

With the magistrate of course rests the most important duty of all; for in addition to his own powers as an individual, he has authority over all other individuals. He may either give firearms to those who assist him, or summon the assistance and advice of the military. He reads the Riot Act. But it is no part of his duty to marshal and lead the constables, or ride with the military. It is his province, in short, to give orders, not to assist personally in their execution.

In conclusion, we have only to advert to the recourse which individuals who suffer in their property from a riot, have against the community of the district to which they belong. In order to establish this recourse, the building or other fixed property must have been either entirely destroyed, or rendered unfit for its customary use, or at least it must have been the *intent* of the rioters so to demolish it. The damages recoverable are the value of the house, or other property, and also of the fixtures, furniture, or goods that may have been destroyed at the same time. 'The object of this,' to use the words of Lord Chief-Justice Denman, 'is to make it the interest of all the inhabitants of a district to exert themselves in the timely suppression of riotous assemblies, and in the prevention of the serious loss that such assemblies may cause to the particular individuals who are the first victims of their lawless outrage; and not to stand quietly by, either through fear or indifference, while the property of a neighbour is destroyed, and the rioters acquire that increase of strength which always accompanies unrestrained violence, until the evil extends itself, and in the end falls upon the heads of those by whose forbearance the strength and power of mischief were permitted to increase.'

There are few of our readers who will not perceive

the utility and interest of the little volume which has afforded most of the materials for this sketch; but we can say besides, that, independently of the information it affords, it is written with great tact, and even taste; and although professionally careful in its references and other details, is perfectly well adapted for popular perusal.

HOSPITAL FOR INFANT CRÉTINS.

THE unfortunate beings whose destiny forms the subject of this memoir are well known to travellers in Switzerland, whose enjoyment of the beauties of that glorious country has often been clouded by the sight of what has hitherto been considered as incurable suffering. The benevolent have sighed over their degradation, the political economist has calculated the dead weight that they must prove on so poor a population, and the Christian has mourned over immortal souls enveloped, as it were, in a chrysalis, which will open only when the cerements of the tomb shall burst.

They have existed for centuries—indeed no one in the country knows the time when there were no crétins in the land; they have existed as an unavoidable evil, and no means had hitherto been sought to turn away so great an affliction or modify its intensity, till one of those noble and unselfish characters which the world sees from time to time stand forth from the crowd, rose up to help them, giving his powers of mind and energies of heart to the subject, and devoting himself entirely to the cure or amelioration of *infant crétins*.

It is now seven years since the simple-hearted and benevolent Dr Guggenbühl founded his asylum on the heights of the Abendberg, a spot which poets and painters might choose as the scene of their reveries, and which is singularly well calculated to supply the wants of its inmates for their physical and intellectual development. A purer air cannot exist, nor a scene of more exquisite beauty. It is an open space three thousand five hundred feet above the level of the sea, between the lakes of Thun and Brienz, and overhanging the towns of Interlaken and Unterseen; below, the mountain is thickly covered by a fine forest, and opposite rises the giant form of the glorious Jungfrau, a sovereign among the mighty Alps. The buildings which form the hospice are extremely modest, but convenient; and on that height is to be found nearly all the necessities of daily life. The produce of the kitchen-garden is, in general, very abundant; and Indian corn, and even other corn, grow well there. The inmates bake their own bread, and sometimes kill their own meat. Poultry and goats complete their stock.

Almost always the winter, which is severe in the valley, passes gently over the heights. Two unfailing springs of water supply them amply with baths, as well as what is wanted for household use.

In this retirement, with all the ardour with which discoveries inspire genius, and the patience and affection with which the love of his fellow-creatures has filled his heart, the young and scientific physician we have named has resolved on spending his life, surrounded by objects for the greater part of a disgusting nature, and without companions of like education with himself, except in the valley below. Before this living example of Christian love we bow with feelings of unmixed veneration; for when he began his work, there were no admiring crowds to fan enthusiasm; there was everything to fear from want of funds; and little co-operation to hope for from the medical practitioners of the country. There were deep-rooted prejudices to overcome: money never is abundant in Switzerland, and one canton takes but little interest in the institutions of another.

Once inspired with this generous determination, and prompted by scientific knowledge, Dr Guggenbühl gave himself up to the study of the probable causes of this mysterious disorder, and of the probable means of curing it. For this, he availed himself of the researches and opinions of others, and also of what is always a sure guide

—the hereditary wisdom of the inhabitants of those places where crétinism is most prevalent.

He found that from the celebrated De Saussure, down to the living physicians of Switzerland, all agreed that the disorder never showed itself *above* the height of four thousand feet on the mountains; and that children attacked by it, and immediately carried up into a purer and keener air, were sure to recover, and even to be more lively and forward on returning again into the valleys, at the approach of winter, than the other children of those parts; but also, they easily fall back again into the same state as before, and require more than one summer spent upon the heights to free them entirely from all symptoms of the disorder.

He found also that those who were rich enough sent their offspring away while infants to healthier spots; and that the inhabitants of Sion, in the Valais, who possess *mayens*, or pastures, and chalets on the heights, send their wives up to them to be delivered there, with the conviction that the infants so born are freer from attacks of crétinism than those born in the valleys. All these undoubted facts led him to found his establishment at the height so indicated, and in the healthiest spot possible, where the little crétins can spend the winter as well as the summer in comfort, and be not only under the care of nurses and physicians, but also under that of schoolmasters and mistresses, and so receive bodily care and intellectual instruction at the same time.

He began in the spirit of Franke, whose example he so often alludes to; and relying on the fullness of Christian benevolence to realise what he felt sure of executing, were the means obtained. His difficulties were great, and the sympathy he met with at first amongst his own countrymen next to nothing; but we cannot but regard the neighbourhood of Interlaken, which in summer is filled with tourists from every country, as a most providential circumstance for the success of the rising hospital.

The first news that we received of its existence was from the graphic pen of one of the daughters of the Russian ambassador, the Baron de Krudener, then at Interlaken, who had accompanied the Princess Rephin on a visit to it, and who described its very infancy with enthusiasm. Some time after, the king of Wurtemberg, while resident at Interlaken, inspected it himself, and gave substantial marks of his interest; and the scientific of all countries, as well as the philanthropic and the curious, who visit the Bernese Oberland, have spread a knowledge of its foundation throughout the continent more rapidly than otherwise could ever have been hoped for.

Nevertheless, ill-natured doubts were thrown on the facts which Dr Guggenbühl published, and ridicule even was not wanting to dishearten and distress him. Some generous-minded persons were, however, to be found who held out a helping hand, and assisted him to put his benevolent designs in execution.

As soon as the establishment was opened, the government of Berne granted it a sum of six hundred livres; and those of Fribourg, the Valais, and St Gall, sent crétin children to be maintained there at their expense. The king of Prussia likewise took notice of it, and ordered two children to be placed there from the principality of Neuchâtel; the Countess of Hahn Hahn, who had taken her daughter to the Abendberg, in the vain hope of effecting her cure (but her age, sixteen, rendered it impossible), with a most natural sympathy for others similarly affected, requested that a Valaisian child should be always maintained there at her expense, to be called *her child*, one succeeding the other when cured, and for which she gave the necessary funds.

Associations began then to be formed in many of the capitals of Europe, beginning with Hamburg, Amsterdam, &c.; and finally, Dr Troxler, professor at Berne, gave the establishment the sanction of his powerful name. Subscriptions were made which have enabled Dr Guggenbühl to extend his operations wider than he possibly could have done; and last year he ventured to add a second building to the original one, that the children might be enabled to continue their

gymnastic exercises through the winter, whereas before, they could only be performed in the open air. He has also added two or three rooms in the new building, which can be occupied by parents of the children, who may wish to remain with them for a longer or a shorter time; for amongst the sick, whom Dr Guggenbühl's rising reputation has brought to the Abendberg, are some of high rank, who, though not precisely crétins, were yet of that class of patients in whom the brain appears not to have been properly developed, and to these he has been of very great use. When we visited him in 1846, and fully enjoyed the sight of so much natural and moral beauty, we saw two titled little girls who had been taken to him from Germany, to die, as it was thought, but who have, on the contrary, lived and prospered under his roof.

Of the number of children hitherto admitted, one-third have been sent back to their families quite cured, others more or less ameliorated, and some few have died. In general, Dr Guggenbühl complains that they are not left long enough, and assures that a long space of time and continued care are absolutely necessary to insure perfect success; not less, he reckons, than three years in general. Some have appeared to baffle every effort, their bodies presenting an ensemble of deformity, their tongues protruding from their mouths, their heads hanging down, their skin wrinkled like a person of eighty, their limbs dwindled to nothing, their bodies enormous, and neither sign of intelligence nor any articulate sound to be drawn from them. Even these, by his kind and judicious treatment, by unwearied care, by baths, by aromatic frictions, by electricity, by goats' milk, by exposure to the air and sun, by every means of infant development, playing, talking, laughing, by lessons with pictures, and by singing—even these have acquired the use of their limbs, the power of speech, the faculty of learning, and have, after a long stay on the Abendberg, been sent back as well as, and even more forward in most branches of instruction, than the generality of children of their age. Their progress is never uniform or regular, but always by fits and starts, and all at once, as if a cell were opened in their brain, or a veil withdrawn from their understanding, and that, too, when least expected. Parents and schoolmasters might learn many a useful lesson on that alpine height, and find data which would save more than one dunce from the rod, and teach the master that he is far more to blame than the scholar.

His great principle is to strengthen the body before he attempts to develop the mind. He even goes so far as to say, that to venture on the second before the first is accomplished, is productive of the most disastrous consequences; and were his warning voice but listened to, how many victims of precocity, how many little wonders, who minister to parental self-love for a time, and then sink into mediocrity afterwards, might be saved from subsequent suffering and nervous irritability!

Dr Guggenbühl divides crétinism into several different species:—1st, Atrophy, in which the spinal marrow has suffered mostly, and the extremities are nearly paralysed: 2d, Rachitism, where the bones have become soft and spongy, and out of proportion: 3d, Hydrocephalie; the disorder being occasioned by water formed in the cells of the skull, which ought to be occupied by the brain: 4th, Inborn, of which the germ is in the infant at its birth, and which presents any or all of the foregoing principles, and varies in intensity, from the slightly affected, down to the mass of animal matter which lies where it is placed, and can neither move nor speak. In this class are to be remarked those who have imperfect bodily growth, and the head out of proportion to the body; and also those who do not speak, yet are not deaf, but who have great difficulty in articulating, and are too lazy to attempt it.

We might give some striking extracts from the German report published by Dr Guggenbühl in 1846, illustrative of each of these forms of crétinism; but perhaps the following case of the first-mentioned form of crétinism (atrophy) will be considered sufficient in a non-professional journal like this:—

'L—, a little girl of six months old, was brought to us. Her mother is strong and healthy, but her father

weak and scrofulous. Till she was four months old she was in good health, but weaker than children of that age generally. A violent cold was the beginning of her illness; and when brought to our house, her appearance was so wretched, as to procure her the name of *the little worm*, from the Princess-Royal Henrietta of Wurtemberg, during her visit to us; and truly was she so named, for she was frightful to look upon. Her body was more like a skeleton covered with skin than anything else, and that skin was cold and wrinkled. All her muscles were immovable, and the extremities of her body like miniature hands and feet. Her face was deadly white, her forehead and cheeks wrinkled like an old person's, while her black and piercing eyes had a singularly knowing look. She slept ill, her pulse was feeble, and she had no natural heat. She came to us in July; the weather was beautiful, and the keenness of our mountain air, the uninterrupted sunshine of our unclouded sky, the electricity which predominates in the atmosphere, all which have so great an influence on our invalids, were furthered by strict regimen and constant care. This delicate little creature, who so soon after her birth had begun to lose all resemblance to a human being, and that so rapidly, now made as rapid strides towards recovery. In three months' time the deformities of her person began to disappear, her skin recovered its natural warmth, the wrinkles vanished, and her face grew young again, with the hue and the charm of infancy; and at the same time her smile, and the manner in which she took notice of those around her, showed that the faculties of her mind were awakening also. In the space of twelve months, she had lost the appearance of a little doll, and had regained that of children of her own age—proof sufficient of the efficacy of proper treatment begun without loss of time, and of the disorder being more efficaciously treated in earliest infancy than at a later period. It is now eighteen months since she left us, and we have had the happiness of learning from the Pastor Bitzius of Lutzelflück, so well known as a popular writer, in whose parish she is, that she continues in perfect health, and can talk and express herself well.*

Dr Guggenbühl makes a wide distinction between crétinism and idiotism, and after illustrating his ideas on the subject by the description of two brothers who are in his institution—the one crétin, the other idiot—he proceeds thus:—

‘Crétinism shows itself sometimes in the physical development, and sometimes in the intellectual, and sometimes in both, and to about the same degree. It is always accompanied by some great defect in the constitution; while the intellect is, nevertheless, capable of being acted upon.

‘Idiotism, on the contrary, is often found in a beautiful, well-proportioned body. It is occasioned, without any exception, by a fault in the formation of the brain—sometimes too large—or an organisation of it which excludes the possibility of any but a very slight degree of cultivation.

‘Anatomical researches on the bodies of crétins have shown that the seat of the disorder is almost always in the brain. Sometimes its substance differs from that of healthy subjects by being too hard or too little, sometimes it is watery, and sometimes its fibres are flat and small, as in animals. Yet a cause still hidden from us, either before or after birth, hinders the proper development of the brain and of the spinal marrow, both so essentially necessary to the growth and the progress of the child.

‘Crétinism is also closely allied to scrofula: the symptoms of the latter being often, if not always, found in crétins, and the same remedies being generally good for both. (Goitre, also, often accompany or precede it, and are sometimes enormous in old crétins.) Scrofula is frequent in the valleys, very fatal, and its effects dreadful, even when it does not kill.’

Such, then, is crétinism—a disorder which is sometimes brought into the world by the unfortunate child at its birth, and which in that case has a stronger hold over the constitution than when it attacks it at a later period;

but which the oftenest shows itself in the first few weeks, or months, or years of its existence: seldom or ever after the age of seven years; and if met by a change of air and diet, by strengthening and exciting remedies, by action on the nerves, the bones, and the muscles, can be stopped short, and finally cured if taken in time after the moment when it first manifests itself, and if the treatment is continued long enough; and which can almost always be modified: thus differing entirely from idiocy, which is incurable and unmodifiable. Crétins at the highest point of the disorder never live longer than twenty-five years, and pass, as it were, at once from childhood to old age in their appearance.

They are, even in that extreme state of disgusting helplessness, the objects of tenderness and superstitious reverence in their families; according to the beneficent dispensations of a merciful God, who never permits a want in the human race without implanting a feeling in the human heart which is to lead men to minister unto it. Their heads are almost invariably larger than those of other men, and offer some singular and defective forms, through which one feature runs without exception—the depression of the forehead. Unfortunately, those prejudices which exist everywhere amongst the poor, have hitherto greatly hindered all anatomical researches on crétins, and rendered the study of the causes of crétinism so vague and unsatisfactory.

We will now turn to the remedies which Dr Guggenbühl has employed with the greatest success, and which he recommends to the notice and use of the scientific world.

They are, in general, the same, with little variation; and consist in electric shocks on the head and on the feet, given during sleep or in the bath, where generally the little patients pronounce their first distinct words; of aromatic frictions on the back, with baths of the same; of preparations of steel, bark; of the waters of Wiedegg, which are in the neighbourhood; of cod-liver oil; of iodine; of juglum regia; of a diet composed of goats' milk, which is peculiarly aromatic on the mountains; of meat, some few vegetables, with the entire exclusion of potatoes; but above all, and the most important, is continual exposure to the air and sunshine—those who cannot walk being laid out on the grass to inhale the wholesome breezes of that high, pure air;* cold baths they cannot bear. Gymnastic exercises, which require the daily use of every muscle, are also very important, and excite the children to emulation in their feats; whilst the exercise of the faculties of the mind are equally carried on in mental gymnastics, according to the powers of each little scholar. Music has been found to be a powerful aid, soothing, interesting, and refining; and we can bear witness ourselves to the thrilling effect of the voices of the happy little group, who sang to us in their infantine manner the praises of their God. Few persons, we think, could have restrained their tears while listening to that infant choir, and reflecting that but for the Christian love which has watched over them, their voices might still have uttered nothing but groans, and their souls remained ignorant of God their Maker.

Let us now turn to the difficult question—what are the causes of crétinism; and set forth the various suppositions which have been given down to the present day.

From all the observations made by Dr Guggenbühl himself, and collected by him from others, from those also published by the different societies which have examined into it, there seems to remain no doubt that it arises from local causes affecting the state of the atmosphere in which the children are born or live. That it is necessarily hereditary, does not appear; for children of parents half crétin, or with some signs of the disease, often escape; whereas very lively and healthy persons often have crétin children, when living in a close, steamy air, in valleys where there is not a thorough renewing of

* Messrs Schubli and Buxorini have shown by their experiments that the human lungs absorb in the mountain air a much greater quantity of oxygen than in the plain; for which reason the nervous system is more active, animal heat is stronger, and the nourishment given to the body more abundant.

the air, or where stagnant vapours remain on the sides of the hills, by the waters coming down from the heights, and being held in by a ledge of rocks or a belt of trees. We must add also the want of cleanliness and fresh air in the habitations, which are but too often devoid of a sufficient number of windows, and which are generally ornamented in front by a large dunghill, surrounded by a pool of infectious water, from which emanations exhale which must necessarily form a part of the atmosphere of the interior of the dwellings. Want of cleanliness in their persons also—the use of fresh water being no part of their education; and lastly, the miserable food that the peasants in general live upon, consisting of salt meat at times, black bread, hard cheese, and potatoes.

What seems to justify this theory is, that along with the advancement of civilisation (the consequence of long peace), of much travelling, of money flowing into places which formerly were never visited by strangers; in consequence also of the progress made in comfort in the houses, of cleanliness in particular (partially introduced), of drainage, of better roads, &c. it is certain that the very most disgusting form of crétinism has nearly disappeared. Those unfortunate beings, who could neither move, speak, nor show any sign of humanity, except its most degraded form, are scarcely now to be met with. Such were those frightful objects which the French soldiers fired at on their first entrance into Switzerland, not from cruelty, but from the horror with which they inspired them. The inhabitants have also at the same time become more active, laborious, and sober by their intercourse with other countries;* and the great facilities of land and water carriage have introduced the produce of the colonies, and substituted a much more wholesome species of food than the indigestible cheeses, curds, salt pork, and greasy bacon, which before constituted their only nourishment.

Formerly, also, crétins but a step removed from the state we have described were unfortunately permitted by the authorities to intermarry, and thus became the parents of wretches yet more unhappy than themselves. Now, marriages amongst near relations, especially where there is any tendency to disorder, are much discouraged, as being fatal to the health of their children. We may therefore hope that, if no great pressure of misery should fall on the inhabitants of the Alpine valleys, every succeeding year may bring amongst them some of those habits which are the best preventatives of scrofula, goitre, and crétinism.

But to return to the history of the Abendberg. There have been founded two other hospices in imitation of it—the one in Wurtemberg, by a few Christian friends associated together, and which is placed under the direction of Mr Röschi; the other in Saxony, formed by the unwearied efforts of Dr Carus, physician to the king. In Austria, researches are making, under the superintendence of the Baron de Funchtersleben, but no establishment has yet been made; and through the mountains of Caucasus inquiries are going on by the great Russian oculist, Piragoff, whose name is so well known to science. The king of Sardinia also has taken up the subject with royal munificence, and ordered an investigation of every parish throughout his dominions, which has been now at work for many months, and the report of which is expected to be published speedily.

Dr Guggenbühl's second report, as yet only published in German, is accompanied by a very large number of letters of affection and encouragement, addressed to him from all parts of the continent by men of science, learning, philanthropy, and Christian principle, many of whom have visited the Abendberg, and give their witness to its success. They are in some instances accompanied by the diplomas of different learned societies.

* It is a fact that since the opening of the route into Italy by the Simplon, the number of such wretched beings has much diminished all through the Valais. Only since then the banking up of the Rhone has taken place, and is still prosecuted by the authorities of the canton, by which the marshes, which formerly were under water on each side of the river, are drained, and formed into a fertile and salubrious country.

It is now time to close our humble tribute to the beauty and the importance of Dr Guggenbühl's bold undertaking in a medical, a scientific, a philanthropic, a political, and, above all, in a Christian point of view; and we can fearlessly call on all those in our own happy land, where crétinism and goitres are unknown, to whom the present and future welfare of mankind is dear, to come forward with the abundant riches with which prosperity and commerce have blessed us, so different from the scanty resources of poor revolutionised Switzerland, and help one of the noblest and the most unselfish enterprises that the age can boast of.

Let not his confidence in the sympathy and the assistance of the wise and the good of every country be disappointed, but let those who are unscathed by such afflictions build *here* an altar of thanksgiving to God!*

THE PAINTER OF CORK.

In a carpenter's workshop, adjoining a small house situated in a suburb of the city of Cork, a lad of fourteen was standing one day about sixty years ago. He was tall for his age, and slightly made, with handsome features and bright quick-glancing eyes, that seemed to turn in scorn from the instruments of homely industry that surrounded him, and to fix with a gaze of longing love on the waving branches of a fine old elm-tree, that chequered with their greenness the laughing blue of a summer sky. He stood lost in contemplation, till his reverie was broken by a rough voice behind him.

'What, Nat! idling as usual, and staring out of the window instead of finishing the table for Mr Wilson. You know it must go home to-morrow, and it is not half made.'

The boy sighed deeply, and without replying, took up a piece of wood and a chisel which were lying upon the ground, and walked slowly towards the working bench. The person who addressed him was his father, an honest, hard-working mechanic, who, after watching for a while his son's listless resumption of his task, sighed in his turn, and said—'Well, Nat, if you don't wear out many tools by hard work, at least you don't spare the chalk. I'm afraid all the furniture you have made, or ever will make, won't pay me for all the lumps of it you use in scrawling on the walls and timber. You're now no longer a child; and tell me, in the name of common sense, how do you ever expect to earn a livelihood by wasting your time in such folly?' The boy cast a mournful glance round the walls of the workshop, which were flourished over with designs of figures and landscapes. Though drawn with common chalk on the stained plaster, they displayed a freedom of touch and beauty of expression quite marvellous for an artist so young and so untaught. Every picturesque form of inanimate nature or grotesque living figure that met the eye of Nathaniel Grogan, was immediately treasured in his mind, and his hand proceeded to trace it visibly with the sole rude materials within his reach, impelled by an impulse of genius as irresistible as that which filled the birks and braes of Scotland with the untutored and undying melodies of Burns. The youth we speak of is still remembered in his native land as an artist of no common order. Many exquisite engravings and original paintings remain to attest his skill. Had he lived under more favourable circumstances, he might have achieved a European reputation; as it is, we are still proud to class him among the gifted artists whom our city has produced. Some passages in his life deserve to be noticed, and with these we will proceed.

The boy loved his parents, and yet he was thoroughly unhappy: he felt wild longings and aspirations that carried his thoughts far beyond his father's workshop, even while he was chained to unsuitable labour. He was wont to despatch his daily task as speedily as pos-

* A large number of the children admitted are very poor, and many pay nothing; the benevolence of the founder preventing his turning them away from his door.

sible, and then, with a few rude materials which he possessed, pursue his darling studies. One fine summer evening he was sent by his father on an errand, which led him for some distance along the river banks. The varied loveliness of the scene filled the boy's ardent mind with rapture, while the peaceful calm of sunset tended to soothe the repining emotions which were ever ready to arise when he thought of his humble lot. He had long contemplated leaving home, and pushing his fortune in a foreign land: the thought recurred now as he watched his own bright Lee gliding on towards the ocean. But how could he leave his parents?—how tell them that he must forsake the humble occupation to which they had destined him? An opportunity offered sooner than he had expected. An American vessel was in the harbour, and the captain, who was ready to sail for New York, wanted some additional hands. He happened this evening to be taking a stroll by the river side, and remarked young Grogan gazing wistfully on the waters.

'Holla! youngster,' cried he; 'would you like to take a trip across the Atlantic this fine weather?'

The youth started, and looked up. We do not know what reply he made, but it certainly was not in the negative, for before two days had passed, Nathaniel Grogan was shipped on board the Ajax; and his weeping parents, after giving him their parting embrace and blessing, watched with anguish the swelling sails that bore away their only boy.

Ten years passed on, and the Grogans heard nothing of their absent son; they believed him to be dead, and mourned for him as only parents can mourn; but woes of another kind came on them. The father one day, in cleaving a piece of timber, cut his hand severely; he did not at first attend to it properly, and the pain and inflammation in a few days became so great that a fever ensued, and his life was in danger. After a long illness, he began slowly to recover, but continued for some time unable to work. All his savings were expended, and he found himself and his wife reduced to the utmost poverty. Sometimes the poor invalid, when eating his scanty meal of potatoes, so ill suited to restore his wasted strength, would say, with tears in his eyes, 'Ah, if our poor Nat could only have contented himself at home, what a help and comfort he might be to us now!' Then his wife would turn her weeping eyes towards a landscape hanging on the wall, which her son had placed there the day before he sailed, and say, 'God is good, James; let us try and be resigned to His holy will.'

One day when Grogan was nearly recovered, he was sent for by a rich and benevolent gentleman residing in the neighbourhood to execute some trifling jobs in his house. The carpenter's clothes were so old and worn, that he felt almost ashamed to present himself at the door of a handsome dwelling. His employer, however, received him most kindly, and ordered refreshments for him before he proceeded to work. After the poor man had partaken of a hearty repast, Mr — called him, and said, 'I want to bespeak some deal tables and chairs from you, Grogan; but first come into the drawing-room—one of the window frames is strained, and I want to have it settled.' The carpenter of course obeyed, and taking off his shoes at the threshold, entered a more splendid apartment than he had ever seen before.

'Wait there for a moment,' said Mr —; 'I will come directly, and show you what to do.'

Left alone in the drawing-room, Grogan had leisure to look about him. At first he felt bewildered by the splendour of the furniture and richness of the hangings that surrounded him. He also remarked several paintings; but one in particular arrested his attention. It was placed leaning against the wall in an excellent light, and the old man started when he gazed at it. There he saw his own likeness standing in his workshop, everything in it drawn with the utmost fidelity, as it appeared on the well-remembered evening when he bade his son farewell. The figure of the boy appeared

in the foreground, but his face was not seen; for it rested on his mother's shoulder, in whose arms he was locked, and whose meek countenance of wo was portrayed with matchless fidelity. With clasped hands and parted lips the old man gazed; he did not speak or stir till Mr —, who had entered the room unperceived, touched his arm and said, 'Does that picture, Grogan, remind you of any one?'

'Oh, sir, my boy—my boy!' It was all he could say. His chest heaved, and tears, such as poverty and sickness failed to draw, streamed down his cheeks. A side-door opened, and a man rushed in. Who would have recognised the slight pale-faced stripling in that tall handsome figure? But the father knew the soft-toned voice that now, with touching gentleness, besought his pardon; and the father felt the quick bright glance of that eye meeting his, whose beams he had mourned as for ever quenched. It was indeed his long-lost son, returned to comfort him and his wife in their old age.

Since we lost sight of Nathaniel Grogan he had passed through many vicissitudes. He had experienced in the new world all the varied chances of a wandering life, and suffered many and bitter privations, so that often, in utter weariness of spirit and hopelessness of heart, he felt almost ready to lie down and die. How did he mourn over the wayward temperament which led him to forsake his parents and his country: yet he shrank from returning to them a penniless outcast. He vowed to himself that he would achieve honour and competence ere he again trod the green fields of Erin. That vow, through his own persevering endeavours, and the disinterested kindness of some rich countrymen whom he met in America, he was enabled to keep. Having realised some money by the sale of pictures in the United States, he came over to his native city, recommended to the kind and powerful patronage of Mr —. During the voyage, the vessel was for some time becalmed, and Grogan occupied the tedious hours in committing to canvas that parting scene, which the lapse of years had failed to efface from his memory. Like the patriarch of old, his heart was bursting with the question, 'Doth my father yet live?' and, like him, when the sight of that father once more gladdened his eyes, 'he fell upon his neck and kissed him'; and then 'he nourished his father and his father's house with bread.'

The subsequent career of Nathaniel Grogan was respectable and tolerably prosperous. He taught drawing with success for many years in his native city, where, however, his talent failed to be appreciated as fully as it deserved. Some of his paintings still adorn the collections of the gentry in the south of Ireland.

FLYING MACHINES.

If the desire to fly conveyed the presumption that man was ever destined for its enjoyment, it can only be said to be very lamentable that this long-deferred faculty has yet to be realised. But that it is the fascinating occupation of some ingenious minds to draw plans and devise machines for this end, the press has never long suffered us to doubt. A modest, and, for a marvel, a sober-minded little book, by one taking the name of Dædalus Britannicus,* is one of the most recent of such records, and has, by its appearance, suggested the cursory consideration we propose to bestow upon this subject. We conceive, however, that there is a legitimate distinction to be recognised between the arts of *flying* and *floating* in the air. The distinction is such as prevails between a rudderless, oarless, sailless boat, at the mercy of the billow on which it reposes, and a steamer full of volimotory powers. So here, ballooning—that is, being hauled up a certain distance into the sky, and let down again wherever the wind wills—and aerial navigation are very dissimilar things. The one we have attained to; but it is, to say the least of it, a

* Aerial Navigation. By Dædalus Britannicus. Sherwood: 1848.

most questionable thing whether we shall ever be permitted to accomplish the other.

It is needless, in the present advanced state of information, to go into any account of the origin or history of balloons. By the ingenuity of Mr Green and others, the balloon has apparently attained perfection; but after all, it is nothing more than a toy—a machine helpless in the midst of the atmosphere. Unlike the ship at sea, it has nothing against which sails or rudder can be made to act. Theorising men of science, however, are not satisfied, and new contrivances to guide the machine have been attempted. One of these consists of a sail placed horizontally, or vertically, in connection with proper sustaining apparatus attached to the car. Mr Edgeworth first proposed the use of this resisting surface to the Royal Irish Academy in 1795, but it was principally for facilitating the ascent and descent of the machine. A Mr Evans appears to have conceived the first successful method of directing the flight of the machine. Using a small 'Montgolfier' balloon, he suspended a large oblique surface beneath it. When the balloon ascended, it ascended in the direction toward which the upper edge of the oblique surface looked, and descended again to the point to which the lower edge was directed. Thus a sort of aerial tacking was attained. The course which a balloon thus fitted would take in its ascent, might be described thus ; then when it attained the highest point, the edge of the plane would be reversed, and the balloon would descend thus ; or the whole course . It was proposed that two balloons should be used—a Montgolfier below, and a hydrogen a considerable height above. Biot remarked, this was placing a furnace underneath a powder magazine. It was manifest that aerial voyaging, if only to be accomplished by this means, had little to recommend it to the philosopher, and none to the expeditious traveller. This idea, therefore, fell to the ground for a time. The motive powers of the steam-engine were then thought of, and it was proposed to place a light engine in the car, which should actuate a pair of vanes on either side. But the weight of engines, fuel, water, and the necessary attendants, has hitherto been an insurmountable difficulty. The lightest marine-engine, on the condensing principle, cannot be made under at least twelve or thirteen hundredweight per horsepower. Many ingenious plans were devised for reducing the weight of the steam-engine. Mr Gurney invented some engines, which, with their fuel for one hour, did not weigh more than 300 pounds per horsepower. Sir George Cayley, an accurate mathematician and a sound philosopher, clung with invincible tenacity to the steam-propulsion idea, and proposed the use of a balloon made of Mackintosh's India-rubber cloth, filling it with steam, and at the same time propelling the car by a steam-engine beneath. He concludes by expressing his belief that Dr Darwin's lines, so often quoted, and in our day in part so strikingly fulfilled, should yet receive their fulfilment in the regions of air:—

'Soon shall thy arm, unconquered steam! afar
Drag the slow barge, or drive the rapid car;
Or on wide-waving wings expanded, bear
The flying chariot through the fields of air.'

The steam-engine being thus apparently a hopeless drag, our aeronautic genii returned to balloon-manceuvring. A Dr Macsweeney of Cork has written a pamphlet, in which he enters into a description of the *aéro-tactics*; and there are several curious modes of balloon progression described by this sanguine gentleman. One method of navigation is called *balloon-warping*. It requires two balloons, which must be connected by a long rope; and after some perplexing fashion or other, it is stated that the aeronauts can by this means wind or warp one another along. Another equally curious and whimsical, and, in our estimation, of about an equal feasibility, was called *crescenting*. Let our readers imagine the strides of a giant pair of compasses, in half

circles, across a country, and they will form some idea of the plan proposed under this head. Two balloons were requisite also in this case: under the car of one was a long pole, with a couple of planes of canvas projecting downwards from it. The other balloon was to be made stationary, a brisk breeze was to blow, and the balloon with the pole-planes to be hauled across the current. Thus it would be made to describe a great semicircle—and in this way we were to fly across England! Wings and oars filled with gas were also tried; but this proved a vanity likewise. It was then thought that these erratic machines—balloons—might be made available for the purposes of traffic by means of 'balloon-ways.' This contrivance was by fixing a number of posts, like the posts of our electric telegraphs, from one town to another; a long rope was sustained by these in a spring catch, which ran through a ring in the bottom of the car. Thus the balloon was guided—that is, was to be guided—from place to place.

Passing these fanciful contrivances, we may advert to one which, though discovered long since by Baldwin, still keeps its place in aerial navigation. This is the invention of *hedging*. Probably it derived its origin, as well as name, from the artifice common in navigating a vessel down a stream—which is by carrying an anchor trailing under her bows; thus steerage-way is gained on the vessel. Mr Green; as a substitute, uses the long rope, called the 'guide-rope.' By allowing the end of this rope to trail on the ground, rotation of the machine is prevented, its course is retarded, and a guiding power is to some extent established. It is to be remembered, however, that the rope, when long, is of itself a great addition to the weight of the machine. To meet this objection, a tapering rope has been proposed, the thickest end being attached to the car. The rope thus acts also in some measure as a regulator of the height of the machine. If it has a tendency to descend, more rope is thereby supported on the ground, and the balloon becomes more buoyant; if it rises, it has to carry more rope. A dangerous accident sometimes occurs from the end of the rope lashing round trees and houses; this has been remedied by fastening a long rattan cane to the extremity. After all, even the guide-rope, the simplest and best of these plans, is of very limited application on land. At sea, possibly, it might prove of value. Altogether, we cannot for ourselves look to the guide-rope for much practical benefit beyond its preventing rotation. The success of aeronauts in the air alone having proved so limited, many plans have been suggested for a union of *aéro* and *hydro-nautics*, and several hybrid machines were constructed. In some of these the steam-engine was placed in a boat, which dragged the balloon after it. We are at a loss to discover any superiority over an ordinary steam-vessel in this whimsy.

Perceiving the futility of these schemes, some ingenious men first conceived the idea of forming a machine after the principle of a fish! Their reasoning was ingenious. They perceived the fallacy of comparing a balloon to a ship; and adopting a juster argument, determined to construct an aerial machine on this novel rule. Their machine was called the *aëronautic fish*. It was first planned in the year 1789: it contained many ingenious contrivances: water was used for ballast: it had wings working with cranks, by which its flight was to be secured. But the most curious idea about it was the plan for ascending or descending. The machine being built on the model of a fish, was long and sharp-pointed; underneath it was a weight, which was movable from end to end by a series of ropes and pulleys. When it was desirable to ascend, the weight was pulled down to the tail; this made it heavier, and consequently the prow rose up. If the machine would fly now, it would take an upward course. But if the desire was to descend, the weight was hauled down to the fore part, and it followed, of course, that the direction would be downwards. The balloon was of a long, fish-like figure, by which it was hoped that the tendency to rotation would be destroyed. The machine was constructed in

France, and it is said that Marshal Ney, who took the deepest interest in its construction, spent as much as 100,000 francs upon it. It was launched, it floated, with feeble powers it flew, but it *would* turn on one side. All the ingenuities were in vain; and after a long struggle of patience, talent, hope, and money against the difficulties of the subject, it was thrown aside in despair.

The next attempt had a similar termination. In the year 1835 there appeared in the papers the advertisements of the European Aëronautical Society. Men were prepared for something wonderful, and they were not to be disappointed. In the Victoria Road, London, a dock was built, in which the lines of the first aerial ship were laid down. The name of this machine was the 'Eagle.' Borrowing the idea of the fish aërostat, the object of the inventors was to imitate a fish as far as possible. A vast curiosity was excited by this announcement, and for a time the Victoria Road Dock was the attraction of the learned and unlearned, the ignorant and the scientific. Time wore on, and the machine, when complete, may be thus described:—In order to obtain the requisite buoyancy, a principal part of the Eagle consisted of an immense balloon, in the form of a horizontal cylinder, terminating in a cone at each end. This part of the ship was one hundred and sixty feet long, and sixty feet in height. It was of such dimensions as to contain, by calculation, 200,000 cubic feet of hydrogen gas; consequently the floating capacity was sufficiently large to admit of the suspension of a long car. The ingenious projectors, anxious to carry out their type, had contrived a clever apparatus for imitating the air-bladder of the fish. It is familiar knowledge that the fish is able, by the compression it can exercise over this receptacle, either to rise to the surface or to sink itself to the bottom. This idea was developed also in the Eagle. Along the car ran two iron pipes; these were connected with an air, or in this case, a gas pump, which, by means of a tube entering the balloon, drew out the gas from thence; and pumped it into the iron pipes. In so doing, the effect was precisely similar to that produced by the fish: the machine became specifically heavier, and sank down. To elevate it again, it was only needful to let out some of the compressed gas back into the balloon, when, becoming specifically lighter than an equal bulk of air, the Eagle rose. The next step was the propelling machinery. Keeping true to their original idea, it was constructed so as to resemble, on a vast scale, the pectoral and ventral fins, and the tail of a fish. There were four pairs of fans, two of which were placed on each side of the car. They were made of cane and varnished cotton, by which it was hoped the requisite strength and lightness would be secured. These fans were moved by a windlass, which was worked by the crew. Now the Eagle was to be a really useful invention. It was to make aerial voyages to Paris and back. It was to carry seventeen individuals, and to accomplish the journey in six hours! It was not intended to fly at a greater altitude than three hundred feet, which would clear all ordinary obstacles; and the machine could, on extraordinary occasions, easily rise by means of its compressed gas. Neither was it intended to brave a storm: if the wind were in favour, so much the better; but if, on the contrary, it was right in the Eagle's eye, it was not to be contended with—she was to return, and wait for fair weather. The inventor of this machine is understood to have been Count Lennox. In the year previous to its appearance in London, it is said to have been tried in Paris; but that city proving a bad starting-place, it was brought over to wing its way thither from London. The Eagle never flew; the scheme proved an utter failure; and the name and day-dreams of the European Aëronautical Society are all that now remains of it.

The most recent applications of machinery to balloon propulsion were two small models—the one by the 'veteran aëronaut' Mr Green, the other by Mr Monck Mason. In 1840, Mr Green exhibited in the Polytechnic Institution a small balloon, three feet in

diameter, which certainly did travel in any given direction in the still air of the great room. This he effected by letting a guide-rope hang from the car, and attaching to the car a pair of windmill vanes, which were moved by clockwork contained within. The direction of the aërostat was in a line with the guide-rope, and horizontally. In 1843, Mr Monck Mason effected the same object by affixing an Archimedean screw upon a spindle which protruded from the car. In both cases the result was only such as was to be anticipated—*aerial navigation was not advanced by either.*

The 'Ariel,' the far-famed invention of Mr Henson, is the first modern attempt to construct a machine to fly by mechanical powers alone. The idea was first started about five years ago, and the interest and curiosity produced will be well remembered. Even the legislative assembly caught the infection, and the House of Commons passed the bill for the constitution of the Aerial Transit Company. Sober expectations of seeing the Ariel sweep on rapid pinion over the top of St Paul's were raised in the minds even of thinking men; and wondering crowds went down to Poplar to look at something which popular report declared to be the real machine. The description of it is as follows:—It consisted of a large light frame, 150 feet in length, 30 feet in width, and containing therefore an area of 4500 square feet. The frame was to be covered with varnished linen or silk. There was also a tail, which, turning on a joint, was to direct the Ariel's flight. In the centre of the frame the car was attached. After the requisite arrangements for passengers and the stowage of fuel, came the motive power. This is said to have contained some remarkably clever adaptations. It consisted of a light and powerful steam-engine, suspended in the middle of the wings. It drove two sets of vanes, each twenty feet in diameter, which were placed at the hinder edge of the wings. The boiler was equally remarkable. It was formed of fifty hollow truncated cones, each one being three feet long, and five and a half inches in diameter at the base. These cones were arranged with the blunt ends downwards, all round, and above, and below the fire, thus presenting a surface of fifty square feet to the action of the flames. The steam thus generated was to supply two cylinders of twenty-horse combined power, and after fulfilling its functions, was to be condensed in a number of small tubes, which would be kept sufficiently cool by the rapidity of the flight. Water was thus economised—only twenty gallons of which was said to be sufficient for the boiler to work with. The whole weight of this steam-engine of *twenty-horse power* was put at the fabulous figure of 600 lbs. The Ariel was to start by first running down an inclined plane, the resistance of the air was to carry her off free, and then the vanes were to sustain and to propel her on her way. The main reliance of the inventor appears to have been upon the large resisting surface his machine offered to the air in descending. Calculating the load at 3000 lbs., there was a provision of a square foot and a half for every pound weight—that is, the area of resistance was 4500 square feet. Now it is easily ascertained that a weight equal to the above, under the most favourable circumstances, has a gravitating tendency equal to thirteen miles an hour, or eighteen feet a second—all that the surface of resistance can do being to retard the fall. To sustain this weight, falling at this rate of speed, the power requisite amounts to at least that of sixty horses; and even then nothing would be gained over an ordinary balloon, if we except a pretty rapid tumble should the engines stop work. Therefore the engines of the Ariel must have been trebled in power before it could even *float*; while to fly at the rate of fifty or sixty miles an hour, it would be necessary to raise their power to that of two or three hundred horses. It need scarcely be added that the Ariel never fulfilled those highly-coloured expectations which were entertained of her. A small model was exhibited, which, working by clockwork, and *sustained at the end of a balanced arm*, certainly flew round; but this was all.

Now, the scheme just put forth by Dædalus Britannicus has one merit—that it is a complete novelty, and can be compared in no respects to its predecessors of any kind. Without meaning the smallest unkindness, we cannot compare the representation he has designed of it to anything more appropriately than a flying whale! It is composed of a stout horizontal frame formed of fagots of bamboo, containing within itself a long silk balloon tapering to a point at each end. On each side of the frame are two pairs of boxes, made of sheet iron, supplied with movable lids, which are connected with the main rods of four wings. The wings are to be formed of long and narrow silk planes or feathers, one to be circular in form, twenty feet in diameter, and so connected with the frame by joints and springs, as to make the upward movement in an oblique direction, while in the downward action the whole under surface will be exposed to the resistance of the air. On the under surface of the whale-like balloon is to be a car twenty-five feet long; and at one extremity a conic shield is to guard the balloon from injury; while at the other a rudder or tail, twenty-seven feet long, is to direct its flight. It will be asked, what is the moving power? The answer will be heard with surprise: the successive explosions of a mixture of gas and air in the boxes at the root of the wings, by which means they will be made to flap about twelve times a minute! The balloon, says Dædalus Britannicus, is not to be depended upon for its assistance; it is a mere reservoir for gas. The explosion is to be effected in the four boxes by the electric spark. The inventor calculates on thus attaining a power equal to eighty horses! The weight is placed at 2000 lbs. The velocity he prudently declines to conjecture. 'Judging from the analogy of our model *aéronauts*' [the birds] 'we may expect a rate of progress almost unknown on earth.' Were we to venture an opinion upon the probable success of this machine, we fear it would be found at variance with the sanguine expectations of its author.

To sum up. Willing as we are to welcome the faintest dawn of any invention which will really and in every sense benefit our fellow-men, we must join in the desponding conclusions of many far better able to form a sound decision than ourselves, and say, that notwithstanding that probably upon no subject has so much power of mind been concentrated as upon *aérostation*, and that in a period altogether miraculous for its mechanical attainments, the hopes that it will at any time prove a practicable, or at least a valuable art, appear few and faint indeed. The experience of storm-driven *aéronauts* might have taught them ere this what a toy is the most stupendous of their machines in the tumults of the aerial ocean. And if aerial navigation is to be reserved for fair weather and prosperous gales, our position is already proven.

INDIAN RECREATIONS.

The love of strife and bloodshed would appear to be an original sin of humanity, which is only subdued by the gradual influence of civilisation. In the 'state of nature,' as it was formerly called, this savage passion flourishes in its greatest energy; and in the wildest and loveliest solitudes the ocean holds in its embraces, we find the human inhabitants inspired with the deadliest hatred against each other—family against family, tribe against tribe, nation against nation. It would be agreeable to be able to set this down as the result of circumstances; but unfortunately the same thing prevails throughout the entire world, in paradises of beauty and plenty, as well as in those ungenial wastes where the shivering and hungry savage murders for a meal.

In process of time, when the state of nature proves to be no state of nature at all, but merely the imperfect and rudimental condition of beings destined for a loftier rank, a change takes place in the aspect of society—a portion of the warring groups are welded into one, and form a barbarian state, probably under the

arbitrary government, at first, of some individual who has risen to this eminence by his talents or determination. Their love of strife can now be gratified only by national wars or occasional revolutions—the only other bloodshed taking place in form of law, or by the conventional tyranny of the great over the mean. But although in this stage greatly advanced beyond savagism, the original taint in their character is by no means eradicated. It assumes, however, a new phasis. It expends its vicious energies upon slave-combats and fights of animals; and the bloodthirstiness of the people loses its character of wild courage, becomes allied to cowardice and effeminacy, and paves the way for subjugation, and eventually for a new regime, which is probably destined to advance the race another step in moral progress. It is proper to observe, however, that civilisation does not move like a fluid, overflowing a whole country at a regular level. On the contrary, it leaves masses of the people comparatively untouched; and at this moment, the cock-fighting of the Malays is somewhat more than paralleled by the cowardly brutality of the Welsh main of England.

We have been led into this train of thought by a description, quoted from a Calcutta paper in the 'Indian News,' of an entertainment recently given by the king of Oude to the governor-general, at his majesty's capital Lucknow. It consisted chiefly of combats of animals, which are not only interesting in themselves to the natural historian, but present some points to the moralist well worthy of his attention.

The exhibition, which was witnessed by the king and the governor-general, seated on raised thrones above the other personages, with the mob at a greater distance, commenced with an abortive fight between two elephants. 'Two little partridges were now made to fight, and with difficulty only separated from a desperate struggle. Two *neelgas* (a kind of antelope) were then set a-fighting, and really never have I seen a more furious encounter. They fought most desperately, and it was a real herculean task to separate them. You will be surprised to hear the names of the next combatants—a donkey and a hyena. The hyena had a rope tied round its neck, and from each side of this extended another rope held by two men. The hyena rushed on the donkey, who coolly turned round and gave his antagonist a kick on the head. Not relishing such treatment, the wild beast flew at the poor ass and pulled him over. The donkey, however, soon recovered himself, knelt on the hyena in the most cunning manner possible, and fastened his teeth in his enemy's shoulder, apparently grasping it with the greatest satisfaction. I believe the little fellow, who certainly raised the asinine species high in my favour, would have bit off a portion of it, had not an attendant separated the combatants. I have not seen anything more amusing than this fight, and less harmful in its result. Two terrier dogs next made their appearance; a bird was let loose on the water, and they sent after it. Their part was soon played. Two men next commenced their duties. The first combatant was a man with a large sword, very heavy, with a large handle. He wielded it about as if he was attacked by a host of enemies, groaned, advanced, retreated, jumped, and flourished his weapon with fearful rapidity, cut his neck, and eventually cut a melon in slices, as a feat of dexterity. Another succeeded him, who was in his movements as active as anybody could be. From his actions and motions, I inferred that he was imaginatively attacked by a regiment. He cut, waved his sword, put his shield to every part of his body, and, to say the least of it, was very well practised in agility. Two athletic persons then performed some surprisingly quick movements with weapons like two-pronged forks, and displayed the utmost nimbleness in all their evolutions. They met, closed, overthrew each other, seized each other's hands, loosened them, laid on their backs, and did everything surprisingly well and quick. Two others then fought with each other for about ten minutes, and performed some most admirable

manœuvres; neither, however, received many blows from his ambidextrous antagonist. A man with four swords next came forward, and gave us a specimen of his activity and nimbleness. He had two swords in each hand, the handle of one touching that of the other. The next performer was a man with a *bariat* (a spear with a ball on each end of it), who excelled in agility anything I have ever seen. He held it in the middle, and wielded it like lightning; I really believe it would have been impossible to have struck him with a sword. One man of herculean proportions then displayed feats of dexterity and strength with an immensely thick and heavy club. Men and boys then carried on the sports. Elephant fights succeeded; and an encounter between two rhinoceroses next amused the spectators. After being urged for some time by their keepers, they met, and made two or three pushes at each other with their horns; when suddenly one, not liking the contest, coolly turned round, and, to my surprise, walked into the water and quietly took a bath; the other seeing which, followed his example. Elephant fights commenced again; two of them fought so furiously, that they were only separated with difficulty by men rushing between them with fireworks. There was also some graceful horsemanship exhibited by some men on the opposite side of the water. One rode backwards and forwards with great address, fired a gun, and performed admirable feats of dexterity. At eleven o'clock we went to another place, to witness the tiger and buffalo fights. A buffalo, with a little calf, but not its own, was the first that appeared on the ground below us. Two tigers were then let loose upon it. A slight skirmish between the buffalo and a tiger took place, and another royal Bengal tiger attacked the poor calf, and tore it to pieces. The buffalo once slightly struck one of the tigers and broke his teeth. The skirmishing continued for some time, when master Bruin made his appearance. He was a little fellow, with a great deal of courage; and though he retreated from the charge of the buffalo, did not hesitate to attack a tiger, whom he severely wounded. The latter, however, too strong for the poor bear, seized him in his mouth, pressed his skull, and bit off the greatest part of the lower jaw. The bear retreated to the middle of the arena, staggered about for some time, and then fell down; the eyes turned dim, and he was taken motionless into the cage; a rope, however, prevented his having fair play. The buffalo, meanwhile, smarting only from the wound made by the tiger, several times charged towards the tigers, but did not assail them. Four tigers were then let loose, but only crouched down, and dared not attack the victorious buffalo.

What we would point out as worthy of remark in this detail, is the comparative humanity of the sports, and the obvious change in this respect which has taken place in the national character within no great space of time. In the travels of John Mandelslo we have an account of a dinner given by the native governor of Ahmedabad to his Dutch and English friends, at which the amusement was nautch dancing, performed by twenty girls. When these had danced themselves out, the host sent for another set, who, on refusing to come, were dragged into the presence, and, as a punishment for their insolence, *beheaded* on the spot before the European guests! These were the Indian recreations at the comparatively recent date when the English first appeared upon the scene.

We have only further to remark, that the animal fights of the king of Oude, while betraying the low status which the people hold as a community, are incomparably more humane than the amusements of a portion of the English people.

AUSTRALIAN WINE.

Such is the extent to which vineyards have been planted in New South Wales, that a single landowner, Mr M'Arthur, has made in one year 17,000 gallons of wine, some of which, when bottled, has been sold for 20s. a dozen at Sydney.

OGIER THE DANE.

[BY W. MOY THOMAS.]

[Ogier the Dane was one of the most favourite heroes of the ancient Trouvères. Ariosto and other Italian poets have also given him a place in their poems. The stories that are told of him are innumerable, embracing various portions of his long career, which extended to nearly a century, without impairing the vigour and bravery of his character. At last, on returning from the Holy Land, he is said to have landed by chance on an island belonging to the fay Morgana. That lady, who was a kind of siren, conceiving a strong passion for the ancient warrior, presented him with a crown of three flowers inwoven, which had the power of imparting to the wearer immortal youth, at the same time steeping his delighted senses in forgetfulness. How this charm was at length broken is not now necessary to be known. His fabulous adventures present that curious mixture of northern chivalry and Oriental superstition which is easily accounted for in the long connection of the Moors with Southern Europe.]

Often the starlight have I seen,
And many suns go up the sky;
And long with thee I must have been,
Morgana, dreaming pleasantly.
Yet still the triple-flowered crown
I wear, and in the marble font
I cannot mark a single frown
Whereby my happy years to count.

What was I ere I came to thee?
I know not; but a dream I have
At times of moving on the sea,
Or fighting with a turbaned slave:
Of river-shadowing palm-trees near
Great cities all of marble planned,
And wells of water cool and clear
Wide scattered in a barren land.

Great crowds of people, too, I've seen,
Who called me Ogier the Dane,
And hailed me bravest Paladin;
That fought for knightly Charlemagne;
And seemed it something like a cry
That once had stirred my quiet heart,
But now it passed unheeded by,
As pass the summers where thou art.

From these high towers of Avalon
I see the waters every way,
And the deep sky looks deeper on
The brimming surface of the bay.
Ah! I am safe in Paradise;
I know it, for it changeth not:
I will not fear where nothing dies,
So bring light myrrh and bergamote:

And bring me wine of sunny gold,
And ope the silver-hinged door,
And let the air blow soft and cold
'Mong curtains rustling evermore:
And my Morgana, come and sing
No hateful song of cruel wars,
And thou shalt find me listening
When all the sky is full of stars.

And pleasant shall it be to take
Aside the flowered tapestry,
And see on the fresh-water lake
A circle of the dotted sky.
And if the unaccompanied moon
Come up, we'll watch her all the night,
From rising, till her silver noon,
And thence till morning drinks her light.

So gazing with a dull blue eye,
Entranced he listened, while the sun
Went down, and in the farther sky
A pale star twinkled all alone:
Then sad and weary was the gloom
That spread upon the quiet sea,
And still more sad and wearisome
Her low and thoughtful melody.

And from the dull and lowly mood
These things within his spirit wrought,
He spake of how the fair and good
To evil suddenly are brought.
Meanwhile deep thoughts enfilmed his eye,
And felt they like a dreary spell,
The shadow of the misery
That on the morrow there befell.

TEARS.

BY LEITCH RITCHIE.

We have already given the anatomy of laughter, and are now tempted to inquire into the nature of the opposite phenomenon. This sequence is perfectly natural; for the two subjects are connected by more than contrast—an overflowing of the eye being an unailing accompaniment of the convulsion of mirth. In the midst of life we are in death; in the midst of laughter we are in tears! But the strange association does not end here; for weeping produces joy, by relieving and solacing the wounded heart; and through the gloomy portals of the grave we pass into immortal life.

Weeping is an earlier affection than laughter. The former comes to us with our first inflation of the lungs by atmospheric air; but we are not sufficiently reconciled to the world to laugh at it for some little time. Crying is easy: we take to it by instinct the moment we are born; but we require a month or two, and sometimes more than that, to find out the jest of life. We do not know all at once what people mean by poking us in the ribs, pinching our cheeks, throttling us with their kisses, and addressing us in an unknown tongue. But the fun of the thing at length dawns upon us, and then becomes clearer and clearer, till, beginning with a smile, we get in time to a downright crow. Weeping is not only first, it is likewise last. The tears of infancy are renewed in old age; and the same salutation we give the world at meeting suffices for our farewell. But midway between these two points we are freer from the emotion. Equidistant from the softness of youth and the weakness of age, the 'mortal coldness of the soul' comes down over our manhood like death:—

'That heavy chill has frozen o'er the fountain of our tears,
And though the eye may sparkle still, 'tis where the ice appears!'

Weeping is not only first and last, it is a necessary condition of perfect life. Laughter no doubt is wholesome, from its effect upon the lungs and the circulation; but tears are indispensable to the sight. Some people get on very well without laughing; but we must all look at the world through our tears, or else not look at all. Without this moisture, the eye would lose its brightness, the cornea would wither and dry up, and we should become blind. Laughter is an accident, an exception, a liberty taken with nature; and after the convulsion is over, our features recompose themselves into deeper gravity than before, as if in remorse for their extravagance. Tears, on the other hand, are a normal suffusion that is necessary to the organ of sight; and after their effusion in weeping, we feel refreshed and thankful—the grief that has called them forth being softened by the shower, just as any acrid matter that may enter the eye is diluted by its protecting tears.

But although grief may be the most common cause of weeping, it is by no means the sole cause. Joy, surprise, sympathy, and other emotions, affect us in the same way. When long-severed friends meet again, they not unfrequently weep. Thus Joseph was so affected by the meeting with his brethren, that 'he made haste, and he sought where to weep; and he entered into his chamber, and wept there.' Among savages there is a great difference in this respect. The American Indian would think his manhood foully stained by a tear; while among the New Zealanders, weeping is practised as an accomplishment by the chiefs, who consider it still more necessary to be able to cry well than fight well. The western strangers, they remark, meet their friends like so many dogs—civilised dogs of course they mean—giving each other a paw. As for themselves, they not only embrace, and rub noses, but then sit solemnly down face to face, and drawing their mats over their heads, weep for joy, as if their hearts were breaking.

Triumph, after severe suspense, moves men to tears as commonly as the joy of meeting. Laughter is said by some writers to be a manifestation of this proud feeling; but the same thing might be said more correctly of weeping. We remember, when visiting the church of Notre-Dame at Mantes, being much struck with the loftiness of the vault of the nave, from which some men, engaged in whitewashing the roof, swung in barrels, looking like so many spiders. When this vault was built, and the supports were about to be withdrawn, Eudes de Montreuil, terrified at the boldness of the arch he had constructed, did not dare to look on, but went home, and there awaited the result in an agony of suspense. Judge of his feelings when he heard at length the hasty steps of his nephew, whom he had deputed to witness the operation. 'It stands! it stands!' cried the young man, bursting into the room, 'an immortal monument of your fame!' At the words, the architect fell to the ground, as if struck down with a blow, and burst into a passion of tears.

The constructor of the first Menai bridge had more nerve than Eudes. He looked on while the last chain was fastening, when in another moment the fate of his remarkable work would be determined; but success had the same effect upon him as upon the French architect, and when he saw that all was safe, he burst into tears. A feeling somewhat different from this, united with home recollections, affected Bruce when he saw the object of his adventurous wanderings completed; and his full heart saluted the source of the Nile, not with exclamations of wonder and exultation, but with silent tears.

No more than this! What seemed it now
First by that spring to stand?
A thousand streams of lovelier flow
Bathed his own mountain land!
Thence far o'er waste and ocean track,
Their wild sweet voices called him back.

He wept—the stars of Afric's heaven
Behold his bursting tears,
E'en on that spot where fate had given
The meed of toiling years!
Oh happiness! how far we flee
Thine own sweet paths in search of thee.'

We need hardly remind our readers that Queen Victoria, oppressed with conflicting emotions, wept when the crown was first placed upon her head.

But tears are not only called forth by opposite feelings, they are likewise the cause of opposite phenomena.

'I saw thee weep—the big bright tear
Came o'er that eye of blue;
And then methought it did appear
A violet dripping dew:
I saw thee smile—the sapphire's blaze
Beside thee ceased to shine;
It could not match the living rays
That filled that glance of thine.'

It did not perhaps occur to the poet that these two effects were produced by the same cause, and that his mistress's eye owed its brilliance, as well as its softness, to a tear. The power attributed to the eye in itself is in great part a delusion. It is not a kind of *soul*, as people are fond of representing it, but a mere body, owing its greater or less brightness to the greater or less adaptation of its colour for reflecting light through the lachrymal liquid. Its expression is determined, in great part, by the other features, but more especially the mouth. Look at the face of a blind man, and you will see that it expresses the passions pretty nearly as well as that of a man endowed with sight—wanting only the effect of moisture in the eye, the quantity of which is to a certain degree indicative of the emotion.

We tried recently an experiment on this question, the converse of that of the blind man; putting out the other features instead of the eye, and leaving that alone to tell its story. This we accomplished by means of a paper mask, which hid the whole face with the exception of the eye; and our subjects being chiefly young ladies, it may readily be supposed that we obtained as much expression as nature intended to give. But what an expression! If you have ever witnessed the unnatural effect of a glass eye, think of what *two* would have. While the paper mask was quivering, and the whole frame convulsed with suppressed laughter, there stood the eyes, staring straight forward, cold, stony, mute, spectral, destitute of feeling and of life. There was something strange, almost shocking in the contrast; but when the mask was torn off, and the young and mirthful face disclosed entire, the expression at once returned in a flood of light, and the rekindled eyes laughed till they wept.

The lower animals bear testimony to the same thing. In them we often meet with an expression either of amiability or moroseness; but this is without variety, except in those species gifted with mobility of feature. The cat, for instance, who has no such mobility, except on extraordinary occasions, looks invariably grave, even in the midst of her wildest gambols. The dog, on the other hand, having the power of imitation, has a decidedly human smile when he chooses, and can easily be moved to tears by soft and melancholy tones. But we were once very intimately acquainted with a lady's lapdog, which followed its mistress in something more than her smiles and tears. This little animal was of the most delicate organisation, and of so nervous a temperament, that on meeting a beloved friend (such as ourselves) after a long absence, the joy was overpowering,

and poor Fanny fainted away. This curious manifestation of sensibility we have repeatedly witnessed, although only in the case of the same individual of our canine friends.

With regard to the human species, it is not only in the important circumstances and great emergencies of life that tears come uncalled for; they are produced by a thousand sympathetic emotions, so slight and evanescent, that we can hardly trace their nature or their track. A trait of generosity or nobleness of feeling—a picture of hopeless devotion—a scene of humble happiness—a breath of music—a word—a look, associated with our early recollections—all may cause a sudden suffusion in the eyes, wanting only opportunity to overflow. A deep tragedy affects us in this way less than a little touch of sentiment occurring in a comedy. Our taste may be gratified by the pictured griefs of princes and heroes, but our tears rise more freely in obedience to some thrill of the chord of our everyday feelings and sympathies. Among tragedies, those are the most successful in touching us which the heart can translate into common language, and remove into the humble sphere of its own affections.

It is impossible that a comedy can make us laugh which does not here and there make us sad and tearful. No one can laugh through several acts, any more than he can refrain from yawning after the first few pages of a jest-book. We want contrast to give relief, to carry us on from point to point, to give piquancy to the entertainment. The mind needs no repose, but it must have variety. When tired of one thing, it applies itself to another of a totally different kind—just as a tailor gets up to rest himself by standing. Tears and laughter, besides, are natural associates; a fact which was impressed upon us many years ago by the admirable acting of the elder Mathews, in a trifling little comic piece called 'My Daughter's Letter.' He personified an old Frenchman in Canada, who was constantly calling at the post-office for a letter from his daughter, and was as often disappointed. Here were slight materials—but Mathews was a man of genius; and he so contrived, with his pathos and absurdities, his French broken by English, and English broken by French, and the universal language of nature over all, to keep the audience in a continuous alternation of sobs and laughter. Never did we hear such manifestations of grief—never behold such enjoyment of fun. One moment everybody was drowned in tears, and nothing was heard but catching of breaths and blowing of noses; the next a general burst of laughter swept round the house like a tempest.

A living poet desires of chemistry to turn a tear into a gem, that he may wear it on his bosom:

'Oh that the chemist's magic art
Could crystallise this sacred treasure,
Long should it glitter near my heart,
A secret source of pensive pleasure!'

But as the great bulk of tears consists of water, with only a very small portion of saline substances, it might be difficult to obtain from them in sufficient quantity (unless perhaps in New Zealand) even such evanescent crystals as are left by evaporation. The ordinary use of tears is to wash and moisten the eye, for which a small quantity suffices; but nature is never found wanting in great emergencies, and accordingly, in the case of an accidental injury, the liquid pours upon the cornea in such abundance as may be requisite for its protection. It guards the eye from cold, screens it from light, assuages its sufferings from smoke or other acrid vapour, and breaks the harshness of contact with

a foreign body, which it either dissolves, or floats away in its beneficent stream. Finally, in affections of the mind, and more especially sorrow, tears pour in until they overflow. 'In tears, as Metastasio tells us through Mrs Hemans—

'In tears the heart oppress with grief
Gives language to its woes;
In tears its fulness finds relief,
When rapture's tide o'erflows!
Who, then, unclouded bliss would seek
On this terrestrial sphere,
When e'en delight can only speak,
Like sorrow, in a tear?'

In such emergencies as we have mentioned the operation of nature is spontaneous. When the eye is wounded, she rushes, like a watchful mother, to the rescue, and without any solicitation on our part, pours bountifully out the curative waters of her fountain. But when it is the heart that is torn by great grief or sudden emotion, although she is equally on the alert to soothe and heal, there is this difference, that in the former case we are passive patients in her hands, while in the latter we are often able to exercise control, and defy at once the doctor and the disease. Persons of strong nerve can arrest the torrent of their tears, even when the big drops are trembling on their lashes, and compel the rising waters to sink and disappear. Many an eye looks cold and calm when the fountain of its hot and bitter tears is boiling beneath. Many a pale, smooth brow is raised erect, as if to look down the misery that besets it in society, when the proud man would fain, like him of old, hide himself in his chamber to weep unseen.

But pride, being in itself unholy, cannot be expected to produce good fruits; and accordingly, wherever the dread of tears prevails habitually, and in an excessive degree, we find coldness of heart instead of manliness of character, and an incapacity to extend to others that sympathy which we shrink from ourselves. Abstractedly, there is nothing more unmanly in a manifestation of sensibility by tears than by smiles. The one is no more a proof of weakness than the other; and generally speaking, the former have their origin in the higher and more refined emotions. When reading anything ridiculous, we smile openly; but when the subject awakens our better sensibilities, we either repress our tears, or hide them as something shameful or criminal. Why is this? We have heard in conversation various reasons assigned for the odium into which tears have fallen. Their hypocrisy, for instance, since so many people have the New Zealand faculty of producing them at will; and the constitutional feebleness they betray, since women and children are the greatest weepers. But is the opposite phenomenon more rare in women and children? Is the 'sapphire blaze' always a natural production? Does the silver laugh invariably come from the heart? Have we never heard that a man may 'smile, and smile, and be a villain?' There are, of course, sensibilities for which weeping would be as unavailing a manifestation as laughter; and there are likewise

'Thoughts that do often lie too deep for tears;'

but we suspect that our dread of betraying the softer emotions is a remnant of the same unreflective pride which keeps the western Indian in a state of savagism to this day. The remark, however, is addressed exclusively to our own countrymen; for among most of the continental nations, a proud and manly eye is no more

despised than a sweet and feminine one for being seen, even on many ordinary occasions, suffused with sympathetic tears.

DRY FOGS.

To any one but a metropolitan the subject of fogs is in all probability destitute of much interest. Even the smoke-dried Londoner is beginning to grow weary of the reiterated phenomenon, and the time comes when meteorology alone will look upon a fog with kindness, and take pains to investigate its nature and disclose its causes. If fogs were *all* like 'London fogs,' we should not regret the neglect. We are about, however, to call attention to a variety of this phenomenon which, from the rarity of its occurrence, and the highly important nature of its effects, is sure to excite the reader's interest, and may set afloat his speculations. Meteorologists have agreed to call it, by way of distinction, 'dry fog.' The ordinary aqueous meteor called 'fog' admits of an easy and natural explanation, as produced by the precipitation of watery vapour, held by the air in diffusion, and deposited in the form of opaque spherules of water. Although men of science have disagreed on the subject, it appears most probable that the vapour, in its precipitation, forms minute vesicles or bladders of water, containing each a little spherule of air. The direct causes of such phenomena are, without doubt, principally disturbances of atmospheric temperature, often, probably, the intermixture of a cold current from the north, with a warm, water-laden stream of air from the south or south-west. The peculiar, defiling, world-renowned opacity of a metropolitan fog—a genuine one, that is to say, the 'pride of November'—is undoubtedly attributable to the infusion of the smoke of a million chimneys. It has been clearly shown that carbonaceous particles possess a great avidity for the absorption of different vapours and gases. Absorbing, then, the excessively saturated air, they become doubly increased in weight; and consequently, instead of dissipating by the ordinary process, they sink down, covering the great city with their hateful odours. These few preliminary remarks are necessary, because it is of importance to distinguish between the phenomena classed under the general head 'fog.' It is thus seen that fog, in the ordinary acceptation of the term, is simply a hydro-meteor, connected often, though probably not invariably, if we give credit to M. Peltier, with electric phenomena.

Dry fogs, distinguished from the above in origin and in character, cannot well be described, except from the appearances which attend them. A mass of air appears of a dim blue colour; the azure of the sky has lost its ordinary purity of tone, and appears muddy; objects at any distance are either altogether removed from sight, or are shrouded in a delicate mantle of light-blue; the sun at mid-day is shorn of much of its brilliancy, and its aspect is no longer golden, but reddish; as it nears the horizon, the unprotected eye can look on it without annoyance, and sometimes, if the dry fog is dense, it is lost to sight before it dips in reality beneath the distant hills; lastly, there is often a peculiar odour perceptible, and electrical and even volcanic phenomena are often prevalent about the same time. Occasionally dry fog reaches an intensity great enough to attract public observation, and even to claim record in the works of historical authors. In 1557, after a very hot July, August, and September, thick, ill-smelling fogs made their appearance, and were much noted, by reason of the alarming circumstances which followed in their train. In 1733, a still more extraordinary phenomenon occurred in France. According to De Jussieu, 'fogs more dense than the darkness of Egypt, and of a most offensive odour,' covered the land, and filled the inhabitants with consternation. History also makes mention of a similar phenomenon which occurred in England at the time of the dreadful earthquake which shook the city of Lisbon to ruins. This fog lasted

for eight days, and for density and opacity, had not been equalled for a century previously. In October 1775, the district of Galloway in Scotland was visited by a dark, dense fog, which had the extraordinary duration of *five weeks*. It was accompanied with a particularly disagreeable smoky smell, but with very little rain: the wind continued pretty steadily from the south-east. During the whole period of its continuance, the sun was almost wholly obscured. It appears probable that this fog had travelled northward from France, as the autumn of the same year had ushered thick and noisome fogs, with concurrent maladies, into that country.

We believe, however, that not since the dawn of history has any dry fog been so remarkable as that of the years 1782 and 1783. This phenomenon, in fact, deserves a most conspicuous place among the *memorabilia* of meteorology; its like has never been seen since, nor is there any account of a similar one before. It appeared in the form of a pale blue haze; it was most dense at noonday; at a little distance, objects were totally lost sight of; the sun, at his meridian, looked of a blood-red colour; it was said to possess an indescribably peculiar odour; drying properties of a certain kind were also attributed to it; and it was believed to have deposited in some places drops of a viscid, acrid liquid. The most remarkable fact was its enormous tract of distribution. It covered the immense region extending from Lapland to Africa! Dr Hamilton writes, that in England, from the 1st of January to the end of May, and especially in the latter weeks of that period, there was a remarkably gloomy and uncommonly disturbed state of the atmosphere. Dr Darwin adds his testimony, and declares that the air was quite muddy, and the sun for many weeks obscured by dry fog, so as to appear blood-red. At the same time that it mantled over England, it shrouded Paris; and travellers who had just come from Rome, declared it to be just as thick and hot in Italy; and even the summits of the highest Alps were covered with it. Travellers from Spain affirmed the same of the condition of the air in that country. 'At Dover,' says a contemporaneous account, 'the oldest man living could not remember any fog of so long a continuance;' and it was stated that for weeks the opposite shore could not be descried. On the 10th of June, it appears to have reached an extraordinary height at Lincoln. A thick, hot vapour filled for several days the valley between the hill on which the upper town stands and that which descends from the heath; so that, to borrow an expression of the time, the sun and moon appeared 'like heated brick-bats,' and as they are sometimes seen through a morning fog in the metropolis. The captains of vessels from the Archipelago and Mediterranean, declared that the fog was equally dense in these generally transparent regions; and navigation became excessively hazardous in consequence. This extraordinary phenomenon produced the greatest alarm. The churches, and cathedrals, and saints' shrines on the continent, were crowded with panic-stricken multitudes, who augured from it the immediate dissolution of the present order of things. In England, serious impressions of a similar kind, though differently manifested, were awakened, and many sober-minded Christians believed the end of the world to be at hand. In Paris there was the greatest consternation. M. de Lalande, the eminent member of the Royal French Academy of Sciences, sought to allay the panic, and published a letter to the editors of several journals, conveying his views upon the probable cause of the phenomenon. He stated that a dry fog, of a somewhat similar character, though of course far more circumscribed, had appeared in 1764, and was followed by storms and hail. Such, he predicted, would very likely be the conclusion of the present visitation; and the event showed that he was correct. The grounds on which he thus attempted the solution of the difficulty will be presently stated.

The most tremendous volcanic and electrical phenomena coexisted with the fog of 1783, and succeeded to it.

Calabria was rent by a devastating earthquake, and in Iceland a volcanic eruption of unparalleled violence took place, the lava-stream of which desolated a large tract, and burnt up seventeen villages. The thunderstorms were of terrific energy. One of the principal cities in the north of Hungary was destroyed. The lightning struck it in nine different places, setting the city on fire in every direction, and it was thus burnt to the ground. In many parts of Germany churches were struck, public edifices seriously damaged, and powder-magazines blown up. Silesia was distracted with a succession of similar catastrophes, and experienced in addition the terrors of devastating water-floods. In France, storms of wind laid the country waste, and the harvest of ten domains was altogether destroyed by tempests of hail. In England the ruin was awful. In the course of twenty days, at least *eighteen* deaths took place by lightning-stroke; not to mention a very large number of persons who were struck, but escaped death. In the county of Norfolk, one farmer lost forty sheep, and several horses, by the electric fluid; the destruction of live-stock in other counties was very great. Fire-balls fell upon many houses, destroying them, or setting them on fire, and causing the deaths of the inhabitants. The shipping was struck, and many lives lost; mills were burnt to the ground; mansions and cottages alike were smitten with the ruin-dealing bolts. The thunder rolled its deep tones incessantly over the affrighted country, and appeared to intimate the arrival of more terrible judgments. The lightning assumed the most fantastic forms, sometimes globular, sometimes in broad sheets, and sometimes as if it were emitted from the mouth of a cannon. The rains which followed were unusually heavy, and many districts were laid deep under water.

In the year 1814, a similar obscuration of the air took place, though of a more limited extent, and accompanied by excessive cold. In the metropolis and in Dublin the darkness was extreme; probably much more so than in the case just referred to. Many persons perished by walking into canals and rivers. At the Dublin post-office, in consequence of the condition of the atmosphere preventing their transport, it was calculated that at least *ten tons* of newspapers lay waiting for fair weather. Persons who charitably undertook to guide others through the dim air, were like the blind leading the blind; and the proverbial catastrophe in more than one instance followed. The atmosphere of the year 1831, that much-to-be-remembered period, exhibited a similar foggy condition, but of less intensity, and apparently assimilating closer in character to that of 1782-3. Dr Hancock states that he was informed by an intelligent captain of a sailing-vessel that he could not remember for thirty years such a condition of the air as occurred at that time; and added, that he had not made one voyage free from fog for the past eighteen months. In 1834, says the meteorologist Kæmiz, a dense dry fog was observed, which covered a very large portion of Germany.

We now approach one of the most interesting and most modern examples of a dry fog. In the early part of the year 1846, the 'Gardeners' Chronicle' gives an account from a correspondent of a light fog or haze, which was observed to be slowly travelling over the surface of the earth, from the south-west to the north-east. In some districts the appearances were very remarkable; dense fogs of a defined outline, of a very peculiar kind, were seen to creep over the surface, and sometimes covered whole districts. They were occasionally accompanied with excessive sultriness, and the manifestation of violent electrical phenomena. These fogs were by no means limited to one district, but appeared at different periods very generally over the country, and were particularly remarked in the Highlands of Scotland. Those who encountered them, state that they possessed a very peculiar odour, a sort of half-putrefactive, half-sulphu-

rous stench. Finally, it may be mentioned that toward the close of the last year 1847, in addition to an unusually disturbed condition of the atmosphere, the Registrar-General's report makes mention of a period of very unusual darkness, which, being concomitant with the epidemic of the period, lends some probability to the belief entertained by many that that was due to the presence of 'dry fog' in the air.

In the course of the foregoing observations we have avoided intermingling the consequences of dry fogs with the accounts of their occurrence, purposely, that this very remarkable portion of our subject might stand out in clearer relief in its present position. It may be taken as a well-established fact, that the *peculiar dry fog* to which all along reference has been made, is almost invariably followed by the breaking forth of disease. Be the nature of the disease what it may, it exhibits this remarkable peculiarity, that it attacks the lower animals as well as human beings; very frequently it also affects vegetables. Let us support our position. In the instance of 1557, the dry fog had not lasted more than a few days, when a malignant epidemic of extreme violence followed. In France, a raging epidemic catarrh immediately succeeded to the dense dry fog occurring in 1775; and in England, horses and dogs died in great numbers before it appeared amongst the people. The remarkable phenomenon of 1782-3 was still more extensively productive of disease; a severe epidemic catarrh—in other words, influenza—accompanying it. Men and brutes were alike sufferers. A remarkable fact has been mentioned, that at St Petersburg, during the prevalence of this fog, the thermometer suddenly rose thirty degrees, and the *very next morning*, as if the aerial poison only required an elevated temperature to act extensively and immediately, *forty thousand persons* were laid up with influenza! Need we remind bereaved friends and relatives, whose heart-wounds seventeen years have scarcely healed, of the dreadful scourge which visited us in 1831—the CHOLERA? It has been a common mistake lately to state that the last great attack of epidemic influenza preceded the cholera; the fact being just the reverse, for the influenza followed on the heels of that disorder. Now, the atmosphere in 1831 has been already commemorated as being pervaded by dry fog, and we beg to submit the following striking fact. Dr Prout, for several weeks before the arrival of cholera in the metropolis, had been engaged in ascertaining the specific gravity of the atmosphere; and on one particular occasion he found it suddenly *increased*. Surprised at the result, he repeated the experiment; but the increase was still manifest. *Next day*, the first case of epidemic cholera was reported in the metropolis, and from that time the disease continued to spread over the fated city. Influenza succeeded, and prostrated half the population, stopped manufactories, shut up shops, and closed the theatres. It is sufficiently remarkable that the peculiar dry fog which appears thus evidently to have been concerned in the production of these two extensive disorders, was accompanied (as usual) with remarkable electric phenomena, especially a brilliant aurora borealis, with tornados and earthquakes, and with the outburst of a new volcanic crater in the sea, near Sicily. Facts of a remarkable kind have been adduced to prove that the dry fogs of 1845-6 were intimately connected with the potato disease. The recent epidemic—corresponding as it did in every respect with the symptoms of previous epidemic catarrhs—there is every reason to believe, is safely to be attributed to the presence of a similar impurity in the atmosphere; and it is interesting to remember that the period was particularly observed to be marked by electric disturbances, and one or two magnificent displays of the aurora borealis.

The inquiry now arises—can science offer any explanation of these phenomena? The following have been proposed by men of eminence. Lalande believed the great haze of 1782-3 to be caused by the development of a large quantity of electricity in a

hot summer succeeding to a moist winter. But however we may be disposed to admit the actual existence of a large electric charge in this fog, it is difficult to suppose that the presence or absence of electricity could produce, in the first place, an alteration in the physical characters of the atmosphere; and in the second, the remarkable morbid consequences of dry fog. Other meteorologists believe it to have arisen from metallic emanations. We may particularly allude to the ingenious theory of Dr Prout, developed in his *Bridgewater Treatise*. One of the most alarmingly destructive and deleterious gases known to chemistry, is seleniuretted hydrogen, a compound of the metal selenium and hydrogen gas. Berzelius has the honour of its discovery; but he himself experienced the powers of this agent. Allowing a minute bubble, as large as a *pin's head*, to enter his nostril, he was immediately sensible of a violent pain, and *all the symptoms of a very severe catarrh* ensued, and lasted for some days. 'Now,' says Dr Prout, 'selenium is a volcanic product; dry fogs are preceded by volcanic disturbances; is it, therefore, conceivable that some compound of seleniuretted hydrogen, perhaps with ammonia, is the cause of the dry fog, or at any rate of its disease-producing qualities?' Every spark from a mind constituted like Dr Prout's emits light; and we are by no means prepared to negative this conjecture entirely, although we do not consider it equal to the explanation of the whole phenomenon. M. Veltmann has shown that the haze of 1782-3 was coincident with great burnings of peat land in Westphalia. M. Kämtz, following his suggestions, and in the tone of rash confidence which too often characterises an erroneous doctrine, believes that dry fog is—to give his opinion in one word—nothing but smoke. In support of his theory, he states that *the dry fogs of Germany* are coincident with the annual peat-burnings of that country, and are therefore very probably only the diffused smoke arising from these combustions. He also shows that the dense dry fog of 1834 was probably produced by a great peat-burning in Bavaria and on the Hartz Mountains, while terrible conflagrations of peat and forests took place at the same time in Prussia, Silesia, Sweden, and Russia. Upon similar principles he would explain the immense phenomenon of 1782-3, endeavouring to show that the volcanic eruption which destroyed so many villages, and must have carbonised everything it overwhelmed, sent up such a vast volume of smoke into the air, as sufficiently to account for the phenomenon. He treats with disdain the idea that the fog and the epidemic disorders were connected. Highly as we respect the authority of M. Kämtz as a meteorologist, we cannot help feeling that there is a singular want of care in his inductions on this subject. In the first place, it is positively certain that volcanic eruptions have often *succeeded*, instead of preceded, dry fogs; and in the next, we would ask what are all the peat-burnings of Germany, a-fire at one time, compared to the combustion of one American prairie—a very ocean of fire? Yet the dry fog of 1782-3 has no parallel in the history of that continent; or, in fact, to come nearer home, we may ask what is all the smoke thus produced to that poured out in a week by our metropolitan chimneys, or by the more diligent furnaces of Birmingham, Wolverhampton, and Manchester? We are not ignorant that certain astronomical phenomena, such as the scintillations of the stars, are much affected by the actual state of the atmosphere of our country, in consequence of its smoky habits; but it is preposterous to state that anything like the peculiar dry fog, with all its attendant electric and convulsive phenomena, arises from such a source.

It will be considered a pleonasm to say that the subject is altogether involved in deep obscurity. Chemistry confesses its ignorance, and meteorology acknowledges the same. The writer of this article has paid some attention to the question; but it appears impossible, in the present state of knowledge, to arrive at any accurate decision on the subject. It is of consequence,

however, to observe that only ignorance or prejudice will seek to confound the haziness of the atmosphere polluted by smoke with the singular phenomenon in question. The streets of every large city in which mineral coal is consumed, are always more or less shrouded in a pale blue veil; but this will not be confounded with the dry fog, so frequently the messenger of death to a country, or even a quarter of the globe. Mr Darwin, in his *Journal*, mentions the appearance of a peculiar blue haze mantling over distant objects. Humboldt, and other travellers in tropical climates, speak of similar phenomena, alluding to them as contributive of a peculiar grace to the landscape. But this appears principally due to the presence of aqueous vapour in the heated air. Such an unsatisfactory conclusion humbles us. But the position it compels us to assume is the right one after all. It may legitimately stimulate fresh inquiry, while it ought not to fail to elevate our thoughts to Him who has given power to an instrument of correction so terrible in operation, so fearful in effects!

THE HOLY LANCE.

THE Crusades were themselves a miracle of human enthusiasm, and we need not wonder at the narrative of miracles attendant on them which we find recorded by contemporary historians. Fanaticism was the mainspring of the first Crusades, and fanaticism is closely allied to credulity and superstition. The spirit of the age in which they took place was favourable to the belief in superhuman manifestations; and the cause in which the Crusaders were embarked was deemed so peculiarly the cause of Heaven, that no Divine intervention in their behalf appeared too astounding for acceptance. It is in the first Crusade especially that we find most frequent instances of this superstitious credulity and fanaticism; for during it, the inexperienced rashness of the Christians oftenest brought them into straits, from which nothing but the invigorating belief in the marked favour of Heaven in their behalf could have sufficed for their extrication. In the later Crusades we hear less of miracles, and more of warlike ability and knightly prowess: the old saying, that 'God helps them who help themselves,' found readier acceptance than then the narratives of prodigies. Among the marvellous incidents recorded of the first Crusade, none were productive of such extraordinary and important results as the discovery of the Holy Lance—the story of which we have chosen as the subject of the following paper. The miracle and its attendant incidents will be found narrated at length in the work which we have used as our authority—the able and graphic '*Histoire des Croisades*,' by M. Michaud.*

After a protracted siege of eight months, Antioch fell into the possession of the Crusaders by the treachery of one of its citizens. It was high time. An immense host, such as the East can alone raise, was fast approaching for its relief, under Kerbogha, sultan of Mosoul, a warrior grown gray in arms; and on the third day after its fall, the mountain-slopes to the north were resplendent with the glittering armour of the Mussulman army, whose myriads soon covered the banks of the Orontes. The Crusaders had had no time to re-victual the city, and their foraging parties were quickly driven in, or cut to pieces by the Mussulman horse. Despite all the gallant efforts of their chiefs, they were unable to keep the field against their impetuous assailants; and in turn the Crusaders found themselves besieged in the taken city. The citadel of Antioch was still in the hands of the enemy; and the sorties of its garrison, combined with the assaults of the besiegers, placed the Christians, as it were, between two fires. But an enemy more dreadful still was already among them. Famine came, with all its attendant horrors. The chiefs themselves were soon involved in the surrounding misery. Godfrey, as long as any provisions remained with him, freely distributed them to the army; but at last the brave

warrior had to sell his sole battle-horse to procure the barest means of subsistence. The horses themselves were next killed for food, and roots and herbs were eagerly sought after and devoured by the famishing multitude. Despair seized on every heart; the people hid themselves in underground vaults, and shrunk from meeting their fellows in the streets. Antioch was like a city of the dead, or a place deserted by its inhabitants. The deepest silence reigned in its streets; and the stillness of night was only broken by the clangour of cymbal and kettle-drum from the Mussulman camp. Bohemond, left almost alone on the ramparts, strove in vain to rouse his men to defend the walls, and even gave to the flames an entire quarter of Antioch, to compel the inhabitants to bestir themselves. Misery and despair had brought apathy: spiritless, almost motionless, they endured the daily-increasing assaults of the enemy, who now redoubled their efforts in proportion as the prize seemed nearer their grasp.

All seemed lost. But at this fearful crisis fanaticism again woke up in the Christian army, and when all else had failed, saved it, even at the eleventh hour. Weakness and misery had made them superstitious, and prodigies and miracles were not wanting to revive their enthusiasm, and fill them anew with the confidence of victory. A priest, passing the night in a church, had a celestial vision, in which the Saviour, moved by the tears of the Holy Virgin, promised once more to aid the cause of the Christians. A deserter from the city had been met and turned back by his brother, whom he had seen killed in battle at his side, who assured the Crusaders of coming victory; and who said that himself and the rest of the slain would rise up and combat in their ranks. To complete the general enthusiasm, Barthelémy, a priest of the south of France, appeared before a council of the chiefs, and revealed to them how St Andrew had appeared to him thrice when asleep, and thus addressed him:—'Go to the church of my brother Peter at Antioch. Near the high altar you will find, on breaking ground, the iron head of the lance that pierced our Redeemer's side. In three days that instrument of eternal safety will be revealed to the eyes of his disciples. The mysterious iron, carried at the head of the army, will effect the deliverance of the Christians, and will pierce the heart of the infidels.' Adhemar, Raymond, and the other chiefs believed, or feigned to believe, in the apparition: the report quickly spread through the army; and the soldiers said one to another that nothing was impossible to the God of the Christians. For three days the Christian host prepared themselves by fasting and prayer for the discovery of the holy lance.

On the morning of the third day, twelve Crusaders, chosen from among the most respectable of the clergy and knights, met in the church of Antioch, with a number of workmen provided with the necessary tools, and commenced breaking ground at the foot of the high altar. The deepest silence reigned in the church; every moment they thought to see the miraculous iron. The whole army assembled at the gates, which could scarcely be kept shut, awaiting with impatience the result of the search. The diggers had worked for several hours, and had reached the depth of more than a dozen feet, without any appearance of the lance. Evening came, and they had not found it. The impatience of the Christians was every moment increasing. Amid the shadows of night, that now filled the church, one more trial is resolved on. While the twelve witnesses kneel in prayer at the edge of the pit, Barthelémy leaps into it, and in a short time reappears, holding the sacred iron in his hand. A cry of joy bursts from the assistants; it is repeated by the army, who were waiting at the church gates, and is soon re-echoed in every quarter of the city. The iron, on which all their hopes rest, is shown in triumph to the Crusaders; to them it seems a celestial weapon, with which God himself will scatter his adversaries. Every soul is exalted; they no longer doubt the protection of Heaven; and all demand with loud cries to be led to the combat.

Peter the Hermit was forthwith despatched to the gene-

ral of the Saracens, to propose to him a single combat or a general battle. His proud message was contemptuously received by Kerbogha, and the Christian envoys made a hasty retreat, to escape violence from the incensed Mussulmans. The chiefs of the Crusaders prepared for battle on the morrow. The heralds and the priests ran through the streets to animate the soldiers; the night was passed in prayer and devotion; and the last grain of flour in the city was used for the celebration of the mass.

At length day rose on this scene of warlike devotion. The wounded Raymond was left to keep in check the garrison of the citadel, and the rest of the army poured through the city gates into the plain. The sacred lance was borne by Raymond of Agiles. At the head of the army a portion of the clergy walked in procession, chanting the martial psalm, 'Let God rise, and let his enemies be scattered.' The bishops and priests who remained in the city, surrounded by the women and children, blessed from the ramparts the arms of the Christian host; and the neighbouring mountains rang with the war-cry of the Crusaders—'Dieu le veut!—Dieu le veut!' As they advanced into the plain, most of the knights and barons on foot, and many of the soldiers in rags, they seemed like an army of skeletons, so famine-struck were they all. The whole plain and mountain-slopes on the north bank of the Orontes were covered with the Mussulman battalions, among which that of Kerbogha, says an old writer, appeared like 'an inaccessible mountain.' But the enthusiasm of the Crusaders set odds at defiance; the exultation of victory already filled them as they advanced against the enemy. Two thousand Saracens, left to guard the passage of the bridge of Antioch, were cut to pieces by the Count of Vermandois. The fugitives carried the alarm to the tent of their general, who was then playing at chess. Starting from his false security, Kerbogha beheld a black flag displayed from the citadel of Antioch (the preconcerted signal of the advance of the Crusaders); and ordering the instant beheading of a deserter, who had announced the approaching surrender of the Christians, he immediately set about issuing orders for the battle.

Having forced the passage of the Orontes, the Crusaders advanced down its right bank against the Mussulman host, which was drawn up partly on the slopes of the mountains, and partly in the plain, stretching from their base to the river. The Christian army was wrought up to the highest pitch of enthusiasm: the most common occurrences seemed to them prodigies announcing the triumph of their arms. A globe of fire which, after traversing the heavens, had burst over the Mussulman camp, seemed to them a foreign sign of victory: a gentle and refreshing rain, which fell as they were leaving Antioch, was in their eyes a fresh proof of the favour of Heaven: a strong wind, which aided the flight of their darts, and impeded those of the Saracens, seemed to them the wind of Divine wrath rising to disperse the infidels. The army marched against the enemy in the best order. A profound silence reigned in the plain, which everywhere glittered with the armour of the Christians. No sound was heard in the ranks but the voice of the chiefs, the hymns of the priests, and the exhortations of Adhemar.

Of a sudden the Saracens commenced the attack. They discharged a flight of arrows, and with barbaric cries bore down upon the Crusaders. But despite their impetuous onset, their right wing, under the emir of Jerusalem, was repulsed, and driven back in disorder. Godfrey experienced greater resistance from their left wing, which rested on the mountains; but it, too, was at length shaken, and confusion spread through the ranks. At this moment, when the troops of Kerbogha were giving way on all sides, Kilidj-Arslan, the sultan of Nice, who had advanced unseen on the reverse slopes of the mountains, suddenly burst upon the rear of the Christian army, and threatened to cut in pieces the reserve under Bohemond. The Crusaders, who combated on foot, could not withstand the first shock of the Saracen horse. Hugo the Great, apprised of Bohemond's danger, abandoned the pursuit of the fugitives, and hastened back

to support the reserve. The combat was renewed with fresh fury. Kilidj-Arslan, who had to avenge his former defeat at Doriolaus, and the loss of his states, fought like a lion at the head of his troops. A squadron of three thousand Saracen cavaliers, all bristling with steel, armed with ponderous maces, carried disorder and terror into the Christian ranks. The standard of the Count of Vermandois was taken and retaken, covered with the blood of Crusaders and infidels. Godfrey and Tancred, who flew to the succour of Hugo and Bohemond, signalled their strength and prowess by the slaughter of numbers of the Mussulmans. But the sultan of Nice, whom no reverses could daunt, still bore up stoutly against the shock of the Christians. When the battle was at its hottest, he ordered lighted firebrands to be thrown among the heath and dry herbage that covered the plain. Soon a conflagration rose, which surrounded the Christians with whirlwinds of flame and smoke. For a moment their ranks were shaken; they no longer saw or heard their chiefs. Victory seemed on the point of slipping from the grasp of the Crusaders, and Kilidj-Arslan already congratulated himself on the success of his stratagem.

Then, say the historians, a squadron was seen descending from the summits of the mountains, preceded by three knights clothed in white, and covered with dazzling armour. 'Behold,' cried the Bishop Adhemar, 'the celestial aid which was promised you! Heaven declares for the Christians! The holy martyrs St George, Demetrius, and Theodore, are come to combat along with us.' Forthwith the eyes of all were turned upon the celestial squadron. New ardour filled the hearts of the Crusaders, who were persuaded that God himself came to their aid; the war-cry, 'Dieu le veut!' rose again as loudly as at first. The women and children, assembled on the walls of Antioch, by their cries stimulated the courage of the Crusaders; the priests ran through the ranks with uplifted hands, thanking God for the succour which he sent to the Christian army. The charge again sounded along the line; every Crusader becomes a hero; nothing can withstand their impetuous onset. In a moment the Saracen ranks are shaken; they no longer fight, but in disorder. In vain they strive to rally behind the bed of a torrent, and on a height, where their clarions and trumpets sound the assembly. The Count de Vermandois, quickly following up his success, assails them in their new position, and drives them from it in utter confusion. Broken and discomfited, they now only look for safety in flight. The banks of the Orontes, the woods, the plains, the mountains, are covered with fugitives flying in wild disorder, and abandoning arms and baggage to the conquerors.

Kerbogha made his escape to the Euphrates, escorted by a few faithful followers. Tancred, and some others, mounting the steeds of the vanquished, pursued till nightfall the sultans of Aleppo and Damascus, the emir of Jerusalem, and the broken squadrons of the Saracens. The victorious Crusaders set fire to the intrenchments behind which the Mussulman infantry had taken refuge, and great numbers of the infidels perished in the flames. Such was the battle of Antioch, in which the Saracens left 100,000 dead on the field, while the Christians lost only 4000.

When the danger was past, the holy lance began to lose its miraculous influence over the troops. It remained in the keeping of Raymond and his Provençals, and the offerings which it brought to them as its guardians soon excited the jealousy of the rest of the army. Doubts were raised as to its genuineness, and Arnald and the Normans especially distinguished themselves by their vehement outcry against it. In vain miracles in its favour were got up by its supporters: nothing could silence its opponents, and discord rose to an alarming height in the army. At last Barthelemy, carried away by his fanaticism and the applause of his adherents, announced his intention of submitting to the ordeal by fire. In a moment calm was restored in the camp. The pilgrims who followed the Christian army were invited to witness the ordeal, and the host of the Crusaders ranged themselves in a circle round the place of trial. On the appointed

day (it was a holy Friday), a large pile of olive branches was raised in the middle of the vast plain. The flames already rose to a great height, when the spectators saw Barthelémy approach, accompanied by priests, who advanced in silence, barefoot, and clothed in their sacerdotal robes. Covered with a simple tunic, the priest of Marseilles carried the holy lance, decked with waving flaglets. When he had approached to within a few paces of the flaming pile, one of the principal clergy pronounced in a loud voice these words—'If this man has seen Jesus Christ face to face, and if St Andrew has revealed to him the divine lance, let him pass uninjured through the flames; if, on the contrary, he has been guilty of falsehood, let him be consumed, with the lance which he carries in his hands.' At these words all the assistants bowed, and replied together, 'Let God's will be done!' Barthelémy threw himself on his knees, took Heaven to witness as to the truth of all he had said, and recommending himself to the prayers of the clergy, rushed amid the flaming pile, through which an opening of two feet had been left for his passage.

For a moment he was hid from sight amid the flames. Many pilgrims began to bewail him as lost, when they saw him reappear on the side opposite to that where he had entered. He was immediately surrounded by an eager crowd, who wished to touch his garments, and who exclaimed it was a miracle. But the object of their veneration had received mortal injury. He was borne dying into the tent of the Count of Toulouse, where he expired a few days after, protesting to the last his innocence and his veracity. He was buried on the spot where the pile had been raised. Raymond and the Provençals persisted in regarding him as an apostle and a martyr; but the great majority of the pilgrims acquiesced in the 'judgment of God,' and the holy lance, from that day forward, ceased to work miracles.

OCCASIONAL NOTES.

THE FRENCH AGONY.

AT the time when we write—nearly four weeks before the day on which the present sheet appears—France is under the agony of a revolution, one of the immediate effects of which is, by the extinction of confidence, to disorganise the whole industrial system of the country, and put large masses of the people out of relation to their usual means of subsistence. The private suffering from this cause must be very great, and it is difficult to see where and how it is to end. What ought to be the conduct of England on the occasion? May she allowably exult in the distresses of a country which too often has expressed jealous and hostile feelings towards herself? May she even congratulate herself on that embarrassment which promises to make her neighbour for some time to come little able to act as an enemy to other states? We would hope that those who feel thus will be few, and that the bulk of our community will rather be disposed to compassionate the unhappy case of the French, and to show that they do so. Now seems to be the time for attempting to convince that people that England bears no malice towards them, and would much rather be regarded as their friend than their enemy. The French, let us remember, are now only in a new crisis of the transition which they have been obliged to make from the heartless despotism of their ancient monarchy, to such liberal institutions as we ourselves possess. For nearly sixty years has this transition been in progress, and how much the country has suffered in that time need not be particularised. The case is precisely that which was our own in the seventeenth century. Had we then had a predecessor in the realisation of free institutions, and had that state acted sympathisingly in the midst of some such agony as that of the Remonstrance, or the treaty of Uxbridge, or even the settlement of the crown on William and Mary, how pleasingly must we have felt it!—how apt would such conduct have been to wipe out past offences, and induce bonds of fraternal alliance

and peace! It would be well if, while forced in conscience to condemn many of their particular acts, we could truly and earnestly sympathise with the French in the distresses which they have almost involuntarily brought upon themselves. Let there be no levity in our remarks, much less any ill-considered reproaches; but let them see that our only interference is that of the benevolent social feelings, and that the first wish of our hearts is a good deliverance from their troubles. Such at least is, in our judgment, the duty of England on this occasion, under the constraint of the highest laws of our moral nature. The consequences are of inferior importance to the performance of the duty; but human nature can never perhaps be too impressively told that as we sow we must reap.

RELIEF FOR INDIGENT GENTLEWOMEN.

Among the many distressing visions of penury which meet our attention, one of the *most* distressing is that of the poor elderly female 'who has seen better days.' We can scarcely rank it amongst those which come broadly under public notice: it is more apt to shrink from the gaze of the world, and only to be discovered by accident by those who make it their duty to search into the nooks and crannies of our complicated social structure. Scarcely any one, however, can have failed to become acquainted more or less with some particular cases of the reduced gentlewoman; not always, alas! to be pictured as one sustaining neat and clean appearances in some poor lodging, and now and then even presenting herself at the tables of her old acquaintances, but often as the helpless bedrid creature, drawing out an attenuated existence on some miserable pittance, and dependent for half her living, and all the nursing she requires, on some sempstress niece, or old servant scarcely more vigorous than herself. For such persons, the ordinary charities of the country, whether those established by law, or those which spring from special voluntary benevolence, are of no avail, being destined for totally different objects. There is therefore scarcely any groan more hopeless than theirs; in no cases is the exigency of need more overmatched by obstructions to its relief—the chief of these being the delicacy which forbids asking.

A sense of the need which everywhere exists for charity meeting this peculiar form of wretchedness, induces us to advert to an institution having that end in view, which has been in operation for about a year in Edinburgh. It assumes the name of the 'Benevolent Fund for the Relief of Indigent Gentlewomen of Scotland above Fifty Years of Age, and Unmarried.' The mechanism for collecting funds very appropriately consists for the most part of ladies; the annual subscription (inclusive of donations) being half-a-crown. Thus £1265 have been collected in the first year. It may also be remarked as a peculiar feature, that about one half of the established clergy of the country have interested themselves in the collection of subscriptions. The expenses attending the starting of the society have absorbed a larger proportion of the results than was to have been expected; but nevertheless, sums varying from £5 to £10 have been given to 154 applicants. We find in the first annual report some brief anonymous memoranda of a selection of the cases, showing the age, parentage, other resources, and general condition of the poor ladies who have been selected for the society's charity—thus: '74; landed proprietor; about £8; quite blind; occasional aid from friends not related to her; no relations able or willing to support her.' '60; lieutenant royal navy; 3s. a week; nearly blind; weak in intellect; often without food or fire; no relatives.' '60; clergyman; subsistence only from knitting; no relatives.' '76; merchant; taught a school till 75 years old; £5 or £6; incapacitated by age for labour.' '51; captain in army; £6; Queen's bounty; almost constantly bedridden; gets a little assistance from a poor niece, who supports her own mother and two sisters by teaching.' These are short and similes

annals, but how much do they reveal! The report says very modestly, 'The relief, coming to them, as it did, at an inclement season of the year, was most welcome, and in many instances served to provide them with necessaries much required. The aid was in almost all cases administered through the ladies' own pastors, and the gratitude of all was unbounded. Some of the openings of the hearts of the poor destitute ladies to their ministers, when receiving from them the welcome allowances, were most touching.'

We would hope that a fund calculated to be so serviceable in the mitigating of human misery, will continue to be well supported, and will also not be allowed to remain an example unhonoured by imitation in other portions of the empire.

THE CHARACTER OF COSTUME.

ALL who have exercised even a superficial degree of observation, must be aware how much their estimation of a stranger is influenced by the habiliments of his outward man. The garnishing of a bonnet, or the pattern of a vest, can give curious hints on biography; and Beau Brummell's maxim, that a 'man was esteemed according to the set of his shirt-collar,' is not without some experimental truth. Look out on a city thoroughfare, saunter along a fashionable promenade, enter a place of public assembly, and see what varieties of character present themselves to the mind through the different combinations of silk, woollen, and cotton fabrics which form the staple of British apparel. Almost involuntarily a spectator will discover and classify the accurate and inflexible in small ways, who would wage war for the size of a button or the position of a pin; the jumbled and disorderly, whose lives stumble on from one casualty to another; the strivers after effect and show; the servants of unembellished utility; the creatures of milliners, yea, and those of tailors also, who live only from the fashion; and the few who use the fashions of life, yet are not subject to any of them. It is not possible that impressions thus received could be always correct: there are a thousand petty influences that operate on the clothing as well as the conduct of humanity, but they are generally entertained in lieu of something more certain; and those who will not go as far as character, occasionally inquire of beaver and broad cloth regarding the wearer's profession; not only where it has appropriated some peculiar mode, as in the cases of clergy and military men, but in the less conspicuous vocations, where the matter is left entirely to individual selection. Thus poets and Blues were believed to be recognisable in the days of our grandfathers, and some still pretend to discern the insignia of those orders. We once heard a railway clerk assert that he never was mistaken in schoolmasters or commercial travellers; and among the anecdotes of the French Revolution, is one concerning a countess who attempted to make her escape from the Temple in the disguise of a charwoman, but was detected by the aristocratic fashion in which she wore a washed-out cotton shawl. 'How were they dressed?' is a universal inquiry; and the whole body of writers in travels, fiction, and history, seem aware of the fact, and describe the attire of their principal characters with minutiae worthy of the Court Circular. Nor is the idea of its importance unfounded. An old author remarks, 'that it is not Quakers', millers', and bakers' boys alone that are distinguished by the cut and colour of their garments; but individuals, nations, and times, because the habit of clothing is one of the great particularities of man, which, if it be not common to all men, is shared in by no other animal; and like the handwriting, or fashion of speech, it serveth to denote somewhat of his proper personality.' The truth of these observations is strikingly illustrated by a gallery of old family pictures, or those portraits of sovereigns and celebrated persons which exhibit the costume of the ages in which they flourished; and it is an amusing, yet not uninteresting

study, to trace the coincidence that exists between the character of each succeeding century and the fashion of its garments, from almost the dawn of our national history to the reign of Victoria. In this respect costume furnishes the most obvious signs of the times, in which the beholder may read their moral and mental character, even as the picture-lovers of some future generation will speculate on the books of beauty, the fashionable magazines, and, should any be preserved, the photographic portraits of our own day. The earliest account of British costume is given us by Julius Cæsar and his contemporaries, according to whom it consisted of a beard, reaching to the breast like a tangled mane; a mantle which descended almost to the knee, made of the hide of a brindled cow, with the hair worn outwards, and fastened in front with a pin of bone or a long thorn; a shield composed of wickerwork; a brazen javelin; and the greater part of the body painted dark-blue, or some say green, the breast and arms being punctured with the figures of plants and animals, like the tattooing of the South Sea isles. This primitive fashion naturally represents a land covered with primeval forests, the resort of the bear and the bison; huts constructed of wattles and mud, and thatched with heath and fern; gatherings for rude Pagan rites round the solitary cromlech, or in that puzzle of antiquaries—the circle of Stonehenge; and a savage veneration for the Druid and the mistletoe.

How the belles of Britain were arrayed in Cæsar's time we are not informed, but the progress of civilisation may be traced by the dress of the celebrated Queen Boadicea, who lived more than a century later, as described by a Roman historian on a state occasion: her light hair fell down her shoulders; she wore a torque, or twisted collar of gold; a tunic of several colours, all in folds; and over it, fastened by a fibula, or brooch, a robe of coarse stuff. We also gather from some remnants of old Celtic poetry that at the same period the dress of the Druid was a long white robe, as an emblem of purity; that of the bards a blue one; and the professors of medicine and astronomy, which appear to have been curiously connected in the minds of our Celtic ancestors, were distinguished by a garment of green, because it was the garment of nature; while those who aspired to unite the honours of those three vocations to their names, wore variegated dresses of the three colours—blue, green, and white.

Pliny tells us that these divers-coloured garments were made of a fabric called *bracæ*, composed of fine wool, woven in cheques, and evidently synonymous with the Scottish tartan. Several Roman writers add, that of this chequered cloth the many-coloured tunic of Boadicea, and the entire dress of her most distinguished warriors, were formed. From their description of the latter, it appears to have exactly resembled the costume of a Highland chief, with kilt, plaid, and dirk; wanting only the plumed bonnet, and the tasseled sporan or purse. These were the additions of after-times, which came with the pibroch, the fiery cross, and the black mail, to the Celts of our northern mountains; but the days of which we speak were those of the plaided warriors, encountering the cuirassed and Latin-talking legions of Rome—the days of the hewing down of old oak woods—the building of those Roman forts and cities whose ruins and burial urns are turned up by modern excavation. It is curious to consider that the chequered cloth, which was now regarded by the Romans as a savage dress, had once (if a modern and well-supported theory be true) been the costume of a large part of the earth, including the countries afterwards inhabited by the Romans; and that, after surviving eighteen centuries in one corner of the island of Britain, it has come again to be a favourite *wear* over regions far beyond the bounds of the Scottish Highlands, as if the first fancy of the European races with respect to clothing had involved some peculiar felicity, which was sure to rekindle their affections on its being brought again before their notice. True it is the chequered *bracæ*, in

which the heroic queen so nobly, though vainly strove to defend her country and people, is at this moment worn throughout the British dominions—and they are wider than Rome ever dreamt of—in a thousand varieties, from the satins and velvet of court costume, to the coarse muffle cloak or plaid of the winter traveller; while the faith, the power, and the vices of the Romans have long ago become but matters of dry and antiquated history.

Next come the Anglo-Saxon times, of which we have actual portraits preserved in some old illuminated manuscripts, such as that of King Edgar in the Book of Grants to the Abbey of Winchester, A.D. 966. Here flax appears in full fashion—the monarch's dress consisting of a linen shirt, a tunic of the same material, descending to the knee, having long close sleeves, but which sit in wrinkles, or rather rolls, from the elbow to the wrist: it was confined by a belt or girdle round the waist; and the royal attire was completed by a pair of loose buskins, or rather stockings, wound round with bands of gold, which the generality of his subjects supplied with leather, a sort of tiara, or crown, and a short mantle.

Similar habiliments were worn by the good King Alfred, and the renowned Charlemagne; for all the nations of Gothic or Germanic origin, who at that period occupied the continent of Europe, resembled each other in their customs, and even language. The dress of the Saxon ladies appears to have been composed of the gunna, a long flowing robe with loose sleeves, from which the modern word gown is derived; a shorter one called the kirtle; and the head-dress on all occasions consisted of a long piece of linen, denominated the wœlfes, in which the head and neck of the wearer were enveloped. These pictures remind us of the old Saxon chroniclers, with their simple faith and blunt sense; of the low solid Saxon arch; of rude habits, primitive customs, and wild wars with the invading Danes. It was in this period that our national language, our popular superstitions, and most of our rural festivals had their origin. Yet among the kirtles and wœlfes of the Saxon dames we find the curling-irons of modern fashion in full exercise. Adhelm, Bishop of Therborne, who wrote in the eighth century, describes a belle of the period as 'having her delicate locks twisted by the iron of those adorning her'; but the wearers of kid gloves among us little think how many efforts and ages were required to bring those indispensable articles to their present perfection. Till about the end of the tenth century, the hands even of English royalty were covered only by the end of the loose sleeve; but then some of the leaders of fashion began to assume a small bag, with a thumb at the one side, the fingers being all indiscriminately confined, which certainly could not have had the effect of increasing their usefulness.

The Saxon was succeeded by the Anglo-Danish period, so called from the conquest of Canute the Great and his successors, some portraits of whom are extant. Their costume was the same as that of the Saxons; but their chosen colour was black, like their national standard—the raven; on which account the Saxons called them the Black Northmen. But we find they also excelled them in civilisation, for the old chroniclers inform us that the Danes were effeminately gay in their dress, combed their hair once a-day, and bathed once a-week; which seems to have been considered intolerable foppery by the honest Saxons. The Normans, who succeeded the Danes, under the conduct of William the Conqueror, were of similar northern origin, and, as might be expected, retained a similarity of dress. The earliest specimens of their costume are given in the Bayeux tapestry, one of those immense specimens of needlework produced only in the middle ages; being thirty-seven yards in length, covered with scenes from the conquest of England, and said to be the work of William's queen, Matilda, and her maids of honour. Wealth and splendour are evi-

dently on the increase. As we descend to the Norman days, the robes are bordered with fringe of gold; cords and tassels are added to the mantle; but the Saxon beard is gone, as well as the Danish long hair; for a complete exquisite in the reign of the Conqueror would not suffer a single hair to grow on the whole expanse of his countenance, and the entire back of his head, which had only a few short and straggling locks round the forehead, and over the ears.

In the reign of William Rufus, lengthening and enlarging seem to have been the mode; and under several of his successors, long cumbersome garments, with immense sleeves, were the gentlemen's attire, with shoes whose toes turned up in a projecting peak to the height of twelve inches, and a chain at the top, which was fastened to the girdle above; and what progress they made in walking, history sayeth not; yet these days are memorable for the introduction of the oft-denounced corset, as part and parcel of the ladies' wardrobe; female dresses being then laced tight to the bust, while the skirts and sleeves were of such intolerable length, that it was necessary to fasten them up in huge knots, to admit of moving at all. In a manuscript of the close of the eleventh century, the satirical illuminator has introduced the father of all evil in female apparel, with the skirts as well as the sleeves of the tunic so knotted, and the garment laced up in front.

What a contrast to these civil fashions is presented by the military portraits of the period!—the knight in full panoply, with visor closed! Yet both serve to illustrate the barbarity, pomp, and luxury of the period; the iron age of unlettered pride and despotic strength, when books were things known only to abbots and bishops, when lawsuits were decided by single combat, and the wealth of a nobleman was estimated by the number of peasants he owned, or the amount of plunder his vassals could collect on the highway; for such, in spite of all its tournaments and troubadours, was the period of feudalism, romance, and chivalry. Yet even in these Gothic times, it appears that fashion was scarcely less fickle than her followers in our own age have found her; and in the reign of Edward III., the gallant conqueror of Cressy, a monk of Glastonberg thus expressed his dissatisfaction: 'The Englishmen haunted so much unto the folly of strangers, that every year they changed them in divers shapes and disguisings of clothing—now long, now large, now wide, now strait, and every day clothingges new and destitute and divest from all honesty of old arraye or good usage; and another time to short clothes, and so strait-waisted, with full sleeves and tippets of surcoats, and hodes over-long and large, all so jagged and knit on every side, and all so shattered, and also buttoned, that I with truth shall say they seem more like to tormentors or devils in their clothing, and also in their shoeing and other array, than they seeme to be like men.'

In spite of many such remonstrators, garments continued to increase in variety and expense. Indeed, if there be any truth in the censures of the clergy, and the lamentations of the poets, in which Chaucer himself unites, in his 'Canterbury Tales,' public extravagance in dress seems to have gone to a length scarcely credible in our pinching times even to a London milliner. Grooms and servants are said to wear velvets and damasks; the nobles had their robes bordered with precious stones; and one coat belonging to Richard II. is stated to have cost 30,000 merks. Similar fashions seem to have extended to the court of Scotland, though at a later period. A portrait of James I., in the castle of Nielberg in Swabia exhibits the peaks of the monarch's shoes fastened by chains of gold to his girdle; and in a wardrobe account of James III. of Scotland, A.D. 1471, quoted by Mr Logan, occurs an entry of 'an elne and ane half of blue tartane' [by which was understood not the tartan of the country, but a kind of French serge, so costly, that it was valued at sixteen shillings a yard] 'to lyne his gowne of cloth of gold.' About the same

time mourning first appears in England, but the colour of sorrow was as often brown as black; and Chaucer mentions a widow's robe of brown. The quantity as well as the quality of dress was a great object with our ancestors; their sleeves in particular frequently attracted the legislature's attention, and the most stringent laws were made to curtail their dimensions. One old writer denominates them, when worn by servants, 'the devil's receptacles, into which all they stole was popped.' Yet notwithstanding the overabundance of kirtles and hauserlines, the skirts that required three pages to hold them up in front and rear, the tippets worn round the head, the different-coloured hose, with each side of the gown to match, there was a stately grandeur about the English costume of that period worthy of the romantic honour and high-flown courtesy of knights like the Black Prince, and the first companions of the Garter. Nor will the extravagance of all ranks in dress appear so far beyond belief, when it is remembered that, like all the productions of those ages, the velvets and damasks were intended to stand the test of time; and in spite of the mutations denounced by the Glastonberg monk, gowns and kirtles evidently served the vanity of more than one generation, as we find them mentioned in wills as valuable bequests; and no wonder, when so much of individual property was vested in the wardrobe. The prevalent idea of the feudal times was pomp and display, for which all the comforts and appliances of daily life were utterly neglected; and the merchant or tradesman who appeared in ermine and gold, was content to sit on a three-legged stool, and sleep on a bundle of straw. Articles of dress were on this account regarded as presents fit for royalty to give and receive. We read of Richard III. presenting the Duke of Buckingham with a velvet gown, which, adds the chronicler, 'made the duke right joyful.' Imagine Queen Victoria presenting Lord John Russell with a new paletôt, just to illustrate the difference of our times! There is another peculiarity remarkable in the ancestral portraits of Britain, which is common to those of all Europe to the beginning of the sixteenth century—the difference between male and female costume is scarcely observable. The Crusades, which commenced about the time of the Norman Conquest, doubtless contributed to this state of things, as the flowing robes, as well as the coarse magnificence of Asiatic nations, were brought back to Europe by the warlike princes and nobility. There is also some confusion of terms in the matter of apparel, which sounds strange to modern ears; a gown and a petticoat being mentioned as prominent parts of a gentleman's attire in the reign of Henry V.; and about half a century later, the waistcoats of the ladies cut a conspicuous figure not only in the entries, but even the sermons of the day. Still greater causes of wrath were the horned head-dresses which begin to figure in all female portraits after the battle of Agincourt. Monstrosities of taste they are certainly, some having two curved horns, like, as the old divines remark, to 'ane lowing cow'; others standing erect on the head, covered with linen rather loosely, and varying from two to three feet, according to the taste of the wearer. These are succeeded by another form, rising like a spire so far above the natural height, that history mentions the doors of several churches and palaces which required to be altered, in order to allow the ladies of the court entrance. But it does the common sense of the nation some credit, that the monstrous things were generally disliked. One monk in particular acquired considerable celebrity by preaching a regular crusade against them both in Britain and France, from which latter country they are said to have been imported by Catharine, queen of Henry V.; and with the habit of reference to Satan common to his age, he denominated them 'ye devil's towers;' but adds in one of his sermons, rather ungallantly, 'of a truth I do believe that Bezebab hath more sense than she who invented such headgear.' The portraits of Henry VII.'s reign are

remarkable for the resemblance which costume in general begins to assume to the most prominent of our modern fashions. Were it not that we miss the ribboned and flower-trimmed bonnet of the lady, and find the gentleman's head laden with plumes like a Russian field-marshal, some of them might pass for shadows of the nineteenth century. The difference now becomes perceptible; men begin to wear tight garments, and the modern indispensable of pantaloons first become visible under the sway of the Tudors. The old flowing Eastern style is still more forsaken as the Reformation approaches; feudal pomp and splendour are passing away; men have begun to put less confidence in armour, and less glory in pageants, though there is still an occasional tournament; and the Field of Cloth of Gold, in which Henry VIII. and his rival Francis I. of France displayed their vanity and magnificence, still prove how much was sacrificed to empty display. Yet it was near the time of the world's great discoveries—printing, America, and popular representation; but in the matter of costume, we find the most striking was the display of ladies' arms, which had never been seen since the days of the Norman Conquest.

It was under good King Hal, as one would think he was ironically called in history, that the inexpressibles of the gentlemen were stuffed to such an enormous size, according to one of their contemporaries, with sacks of wool and hair, that a species of scaffolding was erected over the seats in the Parliament House for their accommodation, the ordinary benches being utterly insufficient; and the fashion did not disappear till the beginning of Elizabeth's reign. On the whole, the caprices of its costume betray the age as one which, though filled with great events, was neither good nor grand in England, and characterised by bad taste and worse morals.

The dresses of Elizabeth's reign have found abundant illustrations. These were the days of starch and ruffs; and both articles furnished themes for vituperation to the reforming clergy, if their accounts may be relied on. In the words of Beau Brummell, 'starch was' then 'the man.' Its introduction to the English public, like that of silk-weaving and stocking-knitting, was owing to the persecution of the Protestants of Flanders by Philip II., which drove thousands of the best citizens to seek refuge in England, bringing their arts and industry with them. Linen shirts also became prevalent about this period; and some of them, according to Stubbs, 'cost, horrible to hear, no less than ten pounds!' Elizabeth is said to have never worn the same dress twice; and as her majesty knew the value of her robes too well to part with them, the inventory of her wardrobe, at the close of her long reign, must have been truly astounding; yet with all its cork-shoes, diamond stomacher, stiff corsets, and frightful ruffs, there was a degree of formal splendour and regal state about the court strongly characteristic of the mind of Elizabeth, and the history of her reign, in which there was much strength, and little, though very obvious, weakness. Nor must we forget that the modern hat owes its origin to this period. Stubbs speaks of them as 'head-coverings, made of a certain kind of fine hair, which they call beaver hats, of twenty, thirty, and forty shillings a-piece, fetched from beyond sea, whence a great sort of other varieties do come.' Most people are aware that Elizabeth wore the first pair of silk stockings, and the Earl of Oxford the first worsted articles of the kind ever made in England without a seam, the hose of all preceding monarchs being manufactured by means of the needle and scissors. How the art of knitting was imported, has been already mentioned; and the stocking-frame was introduced some years after, it is said, by the ingenious revenge of William Lee, who took this mode of superseding the industry of a knitter, to whom his addresses had been paid in vain; but this cause of the invention rests only on vague tradition.

Under James I., we find the love of splendour and pageant, which ruled the former reign, still prevalent;

and some letters of that prudent monarch illustrate the anxiety of the nobles to display jewels and diamonds of great value in their caps. 'I send you,' writes the king to his son, the unfortunate Charles I., who was then on a matrimonial expedition, 'the three brethren that ye knowe full well, but newly set, and the mirroure of France, the fellow of the Portugal dyamont, quiche I wold wishe you to wear alone in your hatte, with a little blacke feather.' The story of Louis XIII.'s queen bestowing her diamond epaulette on the Duke of Buckingham, which that luckless gallant returned with expedition, on account of the wrath and jealousy its absence occasioned, has a prominent place in the court scandals of the period.

It was in the reign of the learned monarch that the farthingale attained its highest magnitude—an article, be it observed, very similar in effect to the modern crinoline; and there is an anecdote on record which might apply to the last-mentioned garment also, regarding a Turkish sultana, who, when visited by Lady Wych, the wife of the British ambassador, in all the fulness of her farthingale, seriously inquired if the peculiar appearance it gave to her ladyship's figure were the natural formation of all English women; and when informed to the contrary, she exclaimed, 'God is good, but wonderful are the fancies of the Nazarenes!'

With Charles I. came the cavalier costume, whose abundance of lawn, lace, and ribbons, drooping plume, short cloaks, and mingled grace and foppery, the pencil of Vandyke has made as celebrated as the events of the Civil War. Long doublets and starch were now dethroned, after a reign which comprehended both that of James and Elizabeth. It is remarkable that the latter was of all colours which prevailed in turn, the last of the band being yellow; but the inventrix of it was executed for poisoning Sir Thomas Overbury, it was said, in a yellow starched ruff; and fashion could not tolerate the acquaintance of the gallows. The plain and serious fashions of the Puritan party stand out in strong relief amid so much finery; and even in the portraits of the period, whether of Cromwell in his plain coarse coat and sword, contrasted with Charles covered with gold lace, and wearing a jewel in one of his ears, or a court lady opposed by the russet gown and hat of a parliamentary citizen's daughter, may be read the character of the struggle which then excited so much warlike zeal, and since called forth so much earnest controversy.

The low dresses and affected foppery of Charles II.'s court, in which that well-known superfluity, the periwig had its origin, also indicate the character of the reign as one at once servile, tyrannical, and coarse, though covered with polish: but after the revolution of 1688, Holland begins to take the lead, and sober Dutch fashions come in with the Prince of Orange—the stomacher once more makes its appearance, though not with the diamonds of Elizabeth's day, and the head-dresses are built as high as lace and ribbons can make them; but the periwig continues in its glory, and the chief accomplishments of a beau at the establishment of the Protestant succession consisted of combing it in the theatre or ball-room, and cocking his hat over it in some particular fashion. Armour had dwindled down in the days of William III. to a breastplate, a back-piece, and a hat lined with steel; but the last remnant of old knightly fashions—the sword—was retained (a worse than useless appendage) at the side of every gentleman, amid the square cut coats, stiffened out with buckram and wire, the long flap waistcoats, and the abundant ruffles which distinguish the reign of Anne. As for the ladies, the 'Spectator' and other popular works have kept alive the remembrance of the hoops, patches, commodes, and hair powder in which they delighted to array themselves; and these fashions continue throughout the greater part of the eighteenth century, about the commencement of which snuff-taking is mentioned as one of the habits adopted by belles of the first water, and broadcloth came into general use in gentlemen's apparel:

the last remnants of this capricious taste—hoops, wigs, cocked hats, and all—passed away with the peace of Europe at the first French Revolution. But its portraits, like the literature of the period, indicate the general frivolity and emptiness of the public mind, and a state of things in which real knowledge, or even thought, was confined to the few. The pictures of our own day now meet us, having no temptation to linger among the short waists and long skirts of the war. But it is time to close our sketch, for we cannot anticipate the verdict of posterity on the character of our own costume.

'THE DARK HOUR.'

BY BERTHOLD AUERBACH.—TRANSLATED BY META TAYLOR.

MOST men, who live in the home-circle of their families, enjoy spending 'the dark hour' in quiet. Children grow restless about this time, but the elder folks draw over the fire, and sit musing silently, or now and then exchanging a gentle word of affection. These are moments when the mind receives and imparts the most refreshing and purest thoughts. There seems to be a general reluctance to break the approaching darkness by lighting a candle; for all, unconsciously, have a certain feeling of the holy power of nature, which spreads out before us, so oft unheeded, the wonderful phenomena of light and darkness. Oh the cozy, comfortable chat in the dark hour! One sits looking at another by the flickering light of the fire, and the few words spoken are caught attentively: the eye, too, has repose, for the mind is undisturbed by the object on which it rests. A single word will often fall upon the ear like an impressive note of music, and convey a feeling which long after finds an echo in the soul.

Farmer Hagenmaier was one evening sitting thus in the parlour with his wife, his son, and his son's wife. The wedding of the young couple had taken place only the day before, and the joy occasioned by the event was fresh in the minds of all. For some time no one spoke a word, and yet one feeling—perhaps one thought—filled their minds. Young Hagenmaier had hold of the hand of his wife, who sat beside him; perhaps the old man guessed the joy there was in his child's heart: he was ensconced in a dark corner, unseen, and thus at length broke the silence:—'Ah, children, 'tis an easy matter to talk of loving one another with your whole heart, and to promise to hold fast your love through life; but when it comes to the point, and you have to yield to each other, to control the will for mutual improvement, 'tis often a difficult task, and words are not then enough. There are times when a man is ready to go through fire to serve his wife; but, without a murmur, to drink a cup of coffee which she may have let heedlessly grow cold—believe me, that's a less easy matter. The words of Scripture are full of meaning, which tell us of the foolish virgins whose lamps were extinguished when the bridegroom came: for many a heart is hardened by self-will, whereas every one ought to be prompt to catch and to enjoy the highest happiness. You see, children, in what love and harmony your mother and I live; but do not imagine that this came without a struggle: I was especially obstinate and self-willed, for in my young days I led a careless, independent life. Hark ye, I'll tell you two stories of the time soon after our marriage, and you may learn a lesson from them—I warrant me you will.

'Well do I recollect my delight the Sunday when I was to go to church with my wife for the first time. We had been chatting away the time unawares that morning, till starting up, I exclaimed, "Come, quick! we shall be too late for church." My wife ran to her chamber to dress. I was ready long before she was, and waiting for her: she had constantly some little matter still to arrange. At first I begged her, in a gentle tone, and jokingly, to be quick; but presently I called louder, intreating and urging her to make haste. Three times did I fill and light my pipe. Each time it went out, as

I stood kicking my heels impatiently, calling to her at the chamber door. At such moments one feels as if standing upon hot coals, or, in other words, in the *figes*. My face was as red as scarlet when she at length made her appearance. I could not speak, and we left the house.

'We had not gone many steps, when my wife recollected something that she had left behind. All the keys had now to be got out—all the closets to be opened. I stayed waiting in the street, and it seemed to me an age till she returned. I thought of going to church alone, but I was ashamed; and when at last she appeared with a smiling face, and began to pull up my shirt-collar playfully, I turned angrily on my heel, and said in a gruff voice, "Go and dress yourself—you are long enough about it forsooth!" And we walked to church in this manner, without exchanging a word more.

'My cheeks glowed with vexation and anger, both with my wife and myself, as I entered the church. My wife went to her seat. Had she once turned round to look for me? I knew not. I leaned against a pillar, and was as stiff as the stone itself. From time to time I caught a word the clergyman said, but instantly forgot him again, and stood staring at the roof and walls, and thinking what a lofty and cold building it was. This had never come into my head before; and I was angry with myself that my thoughts were so distracted, and that I could pay no attention to the sermon. It now occurred to me that this was owing to the misunderstanding with my wife: how indeed could I take to my heart what I heard at such a moment? I longed to make it all up, and looked round at her: she did not, however, raise her eyes, and this vexed me again. Was not *she* in the wrong? thought I; and ought not she therefore to beg my pardon for dawdling and wasting my time in a way to drive one mad? Look ye, children, thus it is with a man when he gets out of temper, and deceives himself about his own heart and conduct. I was angry with my wife, even for being able to say her prayers so calmly, since she had offended me; and in this manner I behaved like a good-for-nothing fellow, both before and during church time, and imbibed that hour which might have been one of the brightest and happiest in my life. Our misunderstanding might very likely soon have been at an end, if I could have taken my wife's hand, and spoken a kind word with her; but we were separated in the church, and it seemed to me as if our quarrel had estranged our hearts for ever.'

The good woman was here going to interrupt her husband, but he said, 'Nay, nay, lovie; let me tell my story out: I have another to follow; and then you may have all the afterpiece to yourself. So you may imagine, children, that we soon made matters up again; for your mother, in her young days, was a merry soul; and whenever I put on a sour look, and was out of temper, she would laugh at me so good-humouredly, that I was forced to laugh too. And then I could not understand how it was I had been so pettish—and all for the merest trifle, not worth speaking of; but the fact is, when a man's anger is up, he does not understand this.

'Well, now for the other story: it is about just such another half-hour's trial of temper. The wedding of our cousin at Lichtenau was fixed to take place; we were invited to it, and were to be there punctually at a certain hour. The day came, and it was high time to start—there was not a moment to lose. I had put to the old gray mare (which we had at that time), and stood cracking my whip at the door. Your mother seemed as if she would never come. I sent up every woman that passed to help her to get ready. I knew she would not like this, and I did it just on purpose to tease her. What business had she to keep me waiting there? When at length she did come, I rated her soundly. Your mother bit her lips as she got into the chaise, and she held her handkerchief up to her eyes the whole while we drove through the village; whilst I

kept on whipping the old mare, till she kicked fore and aft. But when we got outside the village, your mother began to weep, and said, "For Heaven's sake, husband, how can you act thus, and put yourself and me both to shame before all the folks?"

'These words cut me to the heart: I recollected our first walk to church—my wife was now by my side. I threw the reins on the old mare's neck, and stuck the whip behind me: it was time to put reins upon myself; and I may say with truth that I have thoroughly repented my hastiness of temper. But you see how one can tell, from such trifles as these, whether the true light still burns in the heart. The few minutes that I had thus twice to wait proved to me hours of trial; and thenceforth I learned to study the temper and enter into the wishes of others. Think of this, children, if ever you meet with a similar trial.

'Now comes the afterpiece!' cried the good woman. 'And you have forgotten to say, husband, that from that time I never again made you wait, but was always ready before you. Come, now let us light the candles: we have had enough of the dark hour.'

They did so: bright faces, lighted up with good resolutions, gazed joyously one at another.

LAND OCCUPANCY IN SCOTLAND.

SCOTSMEN are sometimes ridiculed for partiality to their native country. It was, after all, an amiable peculiarity, appropriate to a time when Scotland required all the affection of her sons to make her appear a tolerable home. Now that industry and prudence have given her wealth and its enjoyments, we hear much less of national partiality. There are, however, it must be asserted in all seriousness, some institutions in Scotland either greatly superior to any analogous things in England, or in which England is yet altogether deficient, and of which Scotchmen may therefore be allowably somewhat boastful. For example, a perfect system for the registry of property, which makes all incumbrances on land ascertainable by the public. England, too, is only now struggling to obtain the public prosecution of criminals, which Scotland has enjoyed for hundreds of years. The tithe system, which was a bane in England till a few years ago, was settled in Scotland in the reign of Charles I. When one reflects on the period of the origin of many of the good institutions of Scotland, he is tempted to think that the condemnation of the Stuart dynasty, in which it is now the fashion to indulge, is, to say the least of it, too sweeping. Many excellent laws were passed in Scotland by these monarchs, and generally, till the struggles of opinion which commenced with the Reformation, they stood up for the commons against the tyranny of the nobles. To James II., an accomplished prince, who perished in his thirtieth year by the accidental explosion of a cannon (1460), is due the credit of having ratified an act of parliament giving tenants of land those securities which till this day are vainly contested for by leasehold farmers in at least one part of the United Kingdom. This act of the Scots parliament was passed in 1449, and forms the basis of the existing common law and usage respecting the tenantry of land. It is interesting to observe that the act was expressly ordained 'for the safetie and favour of the puir people that labouris the ground;' or, in other words, was a law to protect tenants on lease against eviction and misusage in the event of proprietors wishing to oppress them, or in the case of lands being sold or alienated. This law may be said to have defined the leading points in a lease—the term of years, the periods of entry and outgoing, and the rent to be paid.*

* In old language, the lease is called the *tack*, the period of outgoing the *tak*, and the rent the *mail*. Hence a farm in Scotland was called a *mailing*.

The great attention bestowed on territorial management in Scotland during the last hundred years, has served to consolidate the principle and practice of leasing lands, so that the process is now probably as perfect as it is likely ever to be. The following is a familiar account of the manner in which land tenancy is conducted and operates.

There are few or no tenants holding land by verbal arrangement; that is, no tenants at will. Every farm is let by a written agreement or lease; and a note or missive stating terms of lease is held to be equally valid as a lease, if followed by possession, and that not only against the granter of the lease, but his heirs and successors. Any shuffle by a landlord to oust a tenant in occupation, on the plea that his lease is not technically correct, would meet with no mercy in the Scotch courts; and an attempt to do anything of the sort would incur universal odium. Leases, however, are usually drawn up with great care and precision. The document, of which each party has a copy, defines mutual rights and obligations, specifies the date of entry to the farm, the duration of the lease, the annual rent to be paid, the routine of cropping, &c. Sub-letting is strictly prohibited, and the least approach to such an invasion of the landlord's rights would be instantly checked. The duration of the lease is ordinarily from fourteen to nineteen years—nineteen, very probably, if the lands require much improvement: in either case, the lease is heritable, and its rights and obligations descend to the farmer's family or heirs. Nineteen years form a reasonable length of time for a farmer to sow and reap in every sense of the word. Insured possession either in his own person or his family, he has an inducement to bring the land into the best possible condition, to drain it and to manure it at his own expense, and to subject it to the most approved routine of agriculture. That he has his reward, is evidenced in the position of respectability enjoyed by Scotch farmers generally. But does the farmer not scourge or exhaust the land towards the conclusion of his lease? This is provided against in the agreement, and also by common usage. He must leave the land unexhausted and in crop, but the period fixed for leaving is usually in November, when there is little crop or seed in the ground. A proportion of the value of the lime and manures lately employed on the land is paid for by the incoming tenant. So far, therefore, the lessee loses nothing, and any selfish inducement to take scourging crops from the land is removed. The incoming tenant is also bound to pay his predecessor for the seed sown and unreaped; that is, any crop at the time on the land. But if the farm has proved a fair bargain during the currency of the lease, the tenant most likely desires a renewal. In perhaps three-fourths of all cases a renewal is granted for a fresh term of nineteen years, and generally at an advanced rent, corresponding to the increased value of the farm.

No Scotch farmer starting with a new lease, grudges that he has to pay a somewhat higher rent than formerly. This may seem paradoxical; and yet there is nothing unreasonable in it. A lease for nineteen years is understood to clear all scores. For the first few years, nearly all is paying out; for the latter years, nearly all is coming in—the cost of working the land being much more than covered by the large crops which are produced. It is very interesting to observe the patience with which a Scotch farmer will wait for returns. For years, you will see him with his men toiling to eradicate huge stones from the ground, blasting rocks, digging open ditches, draining with tiles, levelling rude heaps, ploughing, liming, and otherwise improving the farm. At first, the crops are poor; then they begin to look a little better; about the eighth or ninth year they are abundant. Now comes the period of repayment. Ten years of heavy crops, with little outgoing, set all to rights. At the end of the nineteenth year the land does not owe the farmer a penny. Such, in usual circumstances, being the case, the farmer

has no pretension to consider the land as his, or to say, 'I have a claim for making this property what it is.' True, he made a garden out of a wilderness; but he has been more than paid for it. If he has been a sagacious farmer, and not engaged to pay too high a rent, the land and he are quits. When the lease refers to land already improved, the nature of the tenure is not altered: the lessee in such instances runs less risk, and has less toil than on a highly-improvable farm; but he pays rent in proportion, and looks alone to the fourteen or nineteen years' possession for a redemption of all outlays.

On every farm there must necessarily be improvements or meliorations of a substantial and lasting kind, which the tenant cannot be expected to execute even on the principle of self-remuneration. We here allude to the erection of a suitable dwelling-house, a barn, thrashing-mill, and stables, the building of stone walls, planting of hedges, making roads, and so forth. These things, which are of a permanent character, are always executed at the cost of the landlord, and remain his property, the tenant being bound only to keep them in repair. In many instances, a landlord builds a new house for his tenant, on the occasion of a fresh lease with an advance of rent; and thus, from time to time, the farm-buildings in Scotland have been renewed in a substantial manner, greatly to the improved appearance of the country. There are few examples of Scotch farmers building houses entirely at their own cost. Occasionally, where the laird lacks funds, the tenant will engage to pay part of the money, but only on the condition of being repaid in the form of certain annual deductions from the rent; and it is so expressed in the lease. When a new farm-house is to be erected, the tenant, if a man of capital and taste, may possibly offer to pay a certain share of the expense out of his own pocket, provided he is allowed to have a building to his mind. If the landlord agree to this proposal, it is on the express understanding that no claim is in future to be put forward on account of such an outlay; nor is it to be handed down as a burden on succeeding tenants. In general, the landlord is anxious to make the tenant comfortable, and to live on good terms with him; and many examples could be given of landlords voluntarily exceeding the covenants by which they are bound. The farmer is for the most part equally, if not more, desirous of conciliating the goodwill of his landlord. The truth is, each has the power to serve and to annoy the other; and there are therefore the best reasons for adopting terms of mutual conciliation. The only source of discord may be said to be in the game-laws, which are rigidly maintained by some landlords, greatly to the loss, and discontent of their tenants.

Of the private relationship of landlord and tenant, however, we have here no special reason to speak. As respects territorial management, Scotch landed proprietors manifest a keen sense of what is economically proper. In late years they have disregarded the slow process of melioration presented by existing leases; that is to say, seeing that certain improvements are desirable, which have not been stipulated for in the lease, or considered in the rent, they enter into a special agreement on the subject. It may be arranged that, for the sum which the landlord lays out, the tenant agrees to pay interest at a moderate per centage during the remainder of the lease. By this means land is brought at once into the finest state of tillage, and the landlord is certain of receiving an advanced rent next time the farm is to be let.

It will be gathered from all we have said that the Scotch farmer ceases to have any claim whatever on his farm when his lease expires, excepting only what he may have to receive from recently laid down manure, or the seed of unreaped crops. Houses, fences, drains, meliorations of all sorts, become, as a matter of course, the property of the landlord; because all have been executed either directly at his expense, or in virtue of

a covenant, by which the tenant has been required for his personal toil and pecuniary outlay. No tenant farmer in Scotland, therefore, ever asks a sum for 'good-will' from his successor: the idea of such a thing would be looked on as preposterous and impudent in the highest degree. With his successor he has nothing to do, except to settle for the transient matters above alluded to.

Such are the rational, the simple, and satisfactory usages in Scotland respecting lease-tenure. In that country there are no agrarian disturbances; agriculture is pursued as a profession by men of skill and capital; and while the farmers benefit themselves, they also benefit the public, by throwing into the market the abundant produce of their highly-cultivated fields. All this, however, could only have been brought about by the care and enterprise of the landlords. If the landed proprietors had hung back, either through perversity or negligence—had they left tenants to do anything they liked—the face of the country would have been altogether different.

It is melancholy to reflect on the condition to which a fine country may be brought through the inattention of landlords: it is chiefly in consequence of such inattention that the present outcry for 'tenant-right' in Ireland has arisen. We can sympathise with this outcry, for it never would have been heard had Irish proprietors done their duty. In Ireland, leases of land have never been conducted on that uniform and satisfactory principle which is customary in Scotland. In many instances their stipulations are broken with impunity by both parties. We have heard of landlords breaking them on the plea that they were invalid, though they must have been parties to that invalidity. The English law, we fear, has much to answer for on this account. Its cumbrous machinery, and unintelligible technicalities, are unsuitable to Irish capacities and Irish feelings. To turn a poor and ignorant man summarily out of his farm, to break or trample on his lease, and leave him to seek legal redress only by a suit in Chancery, is nothing short of oppression. Evictions, of course, do not usually take place without some grounds of procedure—bad farming, subletting, non-payment of rent, and so forth—but is not the habitual inattention of landlords to their estates a very common cause of abuse? Tenants have been allowed to go on for years as they liked; they have been permitted, without challenge, to make improvements during their leases, and to receive payment from their successors at the close. In this alone there are the elements of inextricable confusion. An entering tenant will be seen paying to the outgoing tenant £100 for possession of an improved farm; and to this sum the new tenant will perhaps add as much more for fresh improvements, as if the property were his own. These sums may be expended for substantial and rational improvements, or they may not. They may be paid for perishable acquisitions, for embellishments of little practical utility, or they may be paid for mere 'good-will'; but for all these the tenant considers he has an equitable claim either against the landlord or against the succeeding tenant. Farther, he considers that he is entitled to sell his right to whom he pleases, and to induct whom he pleases, as if he were disposing of an established business.

These claims are clearly erroneous to a very great extent; and yet they are not only contended for by tenants in Ireland, in memorials to government, at public meetings, and defended and enforced by clergymen and other influential persons; but the principle is also upheld in parliament, and sought to be embodied in public acts. Upon such a principle, a landlord might be improved out of his estate, not only without his consent, but against his will, and in defiance of all propriety. Farm-houses might be turned into mansion houses, wholly unsuited to the size and value of the farms; and common fences made into handsome park walls. In a late case, the sum of £1800 had been expended, and

was demanded, for such improvements, on a farm yielding only £64 of rent to the landlord. The annual interest of £1800 being £90, it thus happened that, according to tenant-right, the landlord would have had to pay £90 a-year to get tranquil possession of a farm yielding only £64 a-year. Was this at all reasonable? Certainly not; but the error fundamentally lay in the landlord not taking care to lease his lands on a sound principle, not looking after his property till it was too late; and we can scarcely pity him for the charges to which, by his negligence, he had exposed himself.

The clamour for tenant-right originates in a sense of wrong and suffering. Without any distinct definition of rights and obligations, the Irish farmer improves his land, and builds a house upon it, and then all at once he is turned abroad on the world, obliged to lose all he had expended. Can we wonder that this injustice should excite commotion? Making every allowance, however, for the hardships endured under the present system, we do not think that the imparting of tenant-right, as it is called, is the proper method of rectifying affairs. The right way of going to work seems to be as follows:—

1. The nature of the claim of each tenant should be examined; what has been expended superfluously should be disallowed; and the balance, if any, for real improvements should be paid by the landlord. If the landlord cannot pay this balance, his property ought to be sold to the amount.

2. But in many instances the lands are in the hands of mortgagees; in such cases the balance to be a charge on the property after the mortgagee's claims are satisfied. A sale, with count and reckoning, would speedily and satisfactorily settle the matter.

3. Solvent landlords being now placed in possession of their properties, they ought in all cases to be compelled to grant definite leases, briefly and simply expressed; and no lease should be valid which has not been examined and certified by a public officer appointed for the purpose of summarily settling disputes as to land in every county.

4. Every lease should be drawn up in the name of the actual proprietor of the land, or at least with his sanction, and the actual farmer. Subletting to be a valid ground of ejectment.

5. A register of leases to be kept in every county, open to public inspection.

6. No ejectment to be legal except between ten o'clock A.M. and two o'clock P.M.; and not without a previous notice of ten days in a metropolitan and provincial newspaper.

He would be a bold man who said that arrangements of the above nature would give peace to the rural districts of Ireland; but they at least aim at disentangling affairs, and placing them on a permanently sure foundation. Will the landholders, however, agree to such trenchant measures, even with the view of relieving themselves from the effects of their heedlessness? and will they turn over a new leaf, and in future, like their brethren in Scotland, pay that degree of attention to their properties which is alone calculated to prevent agrarian disturbance?

A HINT TO YOUNG MEN.

Every young man in this metropolis, if he will only attend to his business, whatever it is, and keep out of scrapes, is a rising man, and has all the prizes and honours of the nation before him, if not for himself or his children, at least for his children's children. There is no reason to complain when this is the case. We have no exclusions of race. Take any dozen men in good circumstances, either at the east or the west end of London; take them in a club in Pall-Mall, or in the Exchange, and inquire into their origin. One is an Irishman, another a Scotchman, another is a Welshman. Perhaps half of them can show a Celt in his pedigree. The same number can produce an ancestor driven to this country by the revocation of the Edict of

Nantes, or a foreigner of still more recent date. So much for race. As for condition, the great-grandfather of one was a labourer; of another a gentleman's butler, of another a weaver, of another a journeyman blacksmith, of another a hairdresser, and so forth. So far from the trade and commerce of London being at all a monopoly, it is notorious that nearly all the tradesmen of London, or their immediate ancestors, came from the country. In the manufacturing districts, these examples of successful industry are still more numerous. Manchester, for example, is made out of nothing. Now this state of things suits the British taste very much better than any scheme for making and keeping all men equal. The fact is, that we don't like equality. Saxons are a spreading, a stirring, an ambitious, and a conquering race. We prefer hope to enjoyment, and would rather look forward to be something better than to be always the same. Englishmen of any thought have just the same feeling about their posterity. They hope to rise in *their offspring*. They also know that they will do so, if they are steady and industrious, and train up their children as they ought to do. Every working man with two ideas in his head knows very well that it is his own fault if he does not thrive, live in a comfortable house, rented at more than £10 a-year, have a little money safely invested, and before many years, find himself and his family safe at least from the work-house.—*Times newspaper*.

SALE OF BOOKS.

In the year 1511, eighteen hundred copies of Erasmus's work entitled 'Encomium Moris' ('The Praise of Folly') were sold; and in 1527, twenty-four thousand copies of his 'Colloquies' were disposed of. In the sixteenth century, sixty editions of the 'Orlando Furioso' were published. It is stated that as many as eighteen hundred editions of the 'De Imitatione Christi' of Thomas à Kempis have been issued. Such was the popularity of Daniel Defoe's satire, called 'The True-born Englishman' (1708), that more than eighty thousand *pirated* copies of it are believed to have been sold in the streets of London. In 1732, Franklin began to publish, in America, 'Poor Richard's Almanac,' the demand for which became so great, that ten thousand copies were sold in one year—a very large number, considering the comparative paucity of readers in the new continent at that time. Richardson's novel of 'Pamela' met with great success, having gone through five editions in the course of a year. When Dr Johnson's 'Rambler' was first published, the sale seldom exceeded five hundred; and it is curious that the only paper in the series that had a prosperous sale, and may be said to have been popular, was No. 91, which Dr Johnson did not write, but is said to have been written by Richardson. So popular were the essays published under the title of 'The Craftsman' (1726), written by Bolingbroke, Pulteney, and other writers, in opposition to Sir Robert Walpole's measures, that ten or twelve thousand were frequently sold on the day of publication. The first edition of M. Thiers's 'History of the Consulate and the Empire of France under Napoleon,' consisting of ten thousand copies, was exhausted in Paris on the day of publication, within the space of a few hours; and orders were soon received for six thousand copies of the second edition. Of Hannah More's religious novel, 'Cælebs in Search of a Wife' (1809), ten editions were sold in the year of its publication. Constable calculated that nearly fifty thousand copies of Scott's 'Lady of the Lake' were sold in Great Britain, from the time of its first appearance, in 1810, up to the middle of 1836. The two thousand copies of the first edition of 'Marmion' were all sold, at the rate of a guinea and a-half each, in less than a month; and up to the middle of 1836, it is computed that about fifty thousand copies had been sold. In the ten years that have elapsed since this calculation was made, the aggregate number of copies sold of both these favourite poems has considerably increased. From the fact of one hundred and thirty editions of 'Hoyle on Gaming' having been published, and only sixteen editions of 'The Whole Duty of Man,' an unfavourable estimate has been drawn of the morality of the times.

PRACTICAL VALUE OF SCIENCE.

Many ignorant despisers of systematic natural history reproach us with wasting our time on nomenclature, or in watching and describing the metamorphoses and general economy of insects; and contend that it is only from what they call 'practical' men—that is to say, farmers and

gardeners—that effective means of destroying noxious species—one of the main objects of entomology, taken in its widest scope—can be looked for. Such objectors should be referred to a paper read by M. Guérin-Ménéville to the Royal Academy of Sciences at Paris in January 1847, from which it appeared that while the cultivators of the olive in the south of France—who in two years out of three lost oil to the amount of nearly 6,000,000 of francs annually by the attacks on their olives of the grub of a little fly (*Dacus oleæ*)—were utterly unable, with all their 'practical' skill, to help themselves in any shape, M. Guérin-Ménéville, though no cultivator, applying his entomological knowledge of the genus and species of the insect, and of its peculiar economy, to the case, advised that the olives should be gathered and crushed much earlier than usual, and before the grubs had had time to eat the greater part of the pulp of the fruit; and by their adoption of this simple plan, the proprietors of olives in the years they are attacked by the *dacus*, can now obtain an increased annual produce of oil, equal in value to £240,000, which was formerly lost, in consequence of their allowing the grubs to go on eating the olives till they dropped from the tree.—*Mr Spence's Address to the Entom. Society, January 1848.*

LOOK FORWARD, AGE!

BY CALDER CAMPBELL.

Thy youth hath long been passed—
The verdure and the flowerage faded long;
Life's sunny smiles, amassed
In pleasant places, amidst dance and song,
Live but in memories, that make them look
Like dried leaves in a book.

Pain, more than pleasure, dwells
Within such memories: therefore seek not thou
To dive within the cells
O'er which their sickly scent dead lilies throw;
Nor ransack records, 'mid whose mildewed leaves
Its net the spider weaves!

Canst thou thy youth restore,
By seeking at its dried-up fount the draught
Which may not ever more,
Howe'er so great thy thirst, by thee be quaffed?
The waters gone to waste, no longer run
All sparkling in the sun.

The gray hairs on thy brow,
Turn thee to piteous auburn, as thy thoughts
Are with the Long-ago,
Careering on the mist that vaguely floats
O'er the past, through which all things appear
More bright, because less clear?

And nimbler grow thy feet,
As thou in thought retracest paths once trod,
Undreaming that deceit
Followed thy footsteps o'er the daisied sod?
Pause ere thou try'st youth's dance with limbs that tell
How years may vigour quell!

Then gaze not on the past
As on a picture, whence true joys may rise,
Or thou wilt find at last
The bitterness of lying vanities;
And, like the reed that shakes to every wind,
Fall with thy fallen mind!

But to the coming look—
Gaze to the eastward—to the rising sun!
See where the gushing brook
Doth from its source in vigorous brightness run;
Read back no leaf, but turn the onward page,
And so look forward, Age!

NOTE.—The individual who wrote a tale in the Journal a few years ago on an incident in the history of the Tankerville family, is requested to correspond with the editor.

SPRING-TIME IN TOWN AND COUNTRY.

BY THOMAS MILLER.

SPRING comes peeping round the corners of the crowded streets and breathless alleys of busy London—twenty times a day do those industrious costermongers, whose stock changes as the seasons change, pass my door, exclaiming, 'All a-growing, all a-blowing!' And the goodwives who have a little back-yard, in which the sunshine sometimes finds itself a prisoner, hurry out and buy wallflowers, daisies, hollyhocks, sweet-williams, &c. &c. at a penny a root; and these they plant in the two narrow square yards beyond the water-butt, where they dwindle away in a week or two, if they are not broken down before morning by the cats. A poor man's London garden measures about six paces; and besides the outhouse at the end, contains a dust-bin, water-butt, coal-shed, two posts that uphold the clothes-line, a little square cinder space in the centre, eight feet by six—the children's playground—and his flower-beds on each side the low, damp, sunless wall. His waving trees are stacks of chimneys, the pots of which are occasionally gilded by the sunlight. In some primitive neighbourhoods, where sewer was never yet sunk, a deep sluggish ditch yawns and stagnates, and there a stunted alder—a kind of living death—does, in its slow decay, now and then manage to make a sign, and lift up its few green leaves, amid which 'smuts and blacks nestle in place of birds.' Not that these London gardens are wholly without their choristers, for there are plenty of sparrows, whose notes seem to have been copied from the sounds made by the knife-grinders in the streets; and sometimes these dirty fellows come out from under the smoky eaves, and hop about like a parcel of little sweeps. 'You never see them 'preen' themselves, like your decent country sparrows; for they seem to know that it would be but 'labour in vain;' so they get case-hardened as soon as they can, and look as glossy as beetles. The banks beside these ditches, instead of being white over with daisies, are strewn with broken crockery, while an old saucepan-handle occasionally shoots out, and here and there a rag flutters from the stunted alders, and throws a cooling shadow upon the fragments of broken bottles below. Part of an old hamper, yellow with rain and rot, at the foot of which a piece of old green baize has been thrown, may, if the imagination is vivid enough, be magnified into a root of primroses. Violets, too, on a washing-day, where the women use plenty of stone-blue, may, by the same imaginative power, be seen to wave on these banks when they empty their washing-tubs. The Zephyrs, who 'fan their odoriferous wings' in these gardens, come in the shape of door-mats and carpets, and raise such cloudy perfumes as make a man sneeze again, while the silver showers rouse every Sabrina that sits

under the 'cool translucent' sewers. These London gardens are also rich in earwigs—great, nimble, long-bodied things, which, if you chance to cut them in two with the spade, make nothing at all of it, but scamper off like an engine without the train, leaving that black and cumbrous body, the carriage, behind. They are accompanied by a genteel sort of worm, with a superabundance of legs. In the bulbs which you have left all winter in the ground, hundreds of little innocent grubs congregate, that come forth in due time, eat up every green leaf, and then attack the stalks. In vain do you apply soap-suds and tobacco smoke; their lives hang not by a slender thread; they were never delicately nursed, but born to endure every hardship. There are thousands of such gardens as these in and around London, and hundreds of pounds are expended in the purchase of flowers in spring-time to decorate these little sunless patches of earth. As for sowing seed, you might as well expect to see a crop of gravel shoot up; a kidney-bean, by the end of a week, is occupied by a thriving family of grubs.

Spring in London is borne through our streets in barrows, or sometimes carried in triumph in a basket on the heads of her votaries; besides flowers, she comes crowned with radishes and young onions; or, like a gleaner in autumn, bears a sheaf of rhubarb on her brow. Her hair is entwined with the sprouts of broccoli, while in her hand she carries a cream-coloured cauliflower. Sometimes you see her crammed into a little sieve, where she sits looking out of the windows in the shape of a salad. There is no room for her to flaunt in all her gay attire in this money-growing city. Her very violets, as if even the perfume occupied too much space, are rolled up in leaves and paper, and sold in a dying state; for London is the great cemetery of flowers—the grave in which all the 'beautiful daughters of the earth and sun' are buried. They cannot live amid its high-piled walls.

'High up the vapours fold and swim,
Above them floats the twilight dim,
The place they knew forgetteth "them."'

How different is spring-time in the sweet, green, open country, where the sunshine seems to sleep like a wide unbounded ocean, stretching to the edge of the very heaven from which the golden radiance descends! Here the silver-footed showers of April leap and chase each other from leaf to leaf; and you might fancy that every rounded drop went dancing on until it became weary, then settled down into the bells of the flowers, or slept amid the opening buds that come forth in their tenderest array of green. You hear the lark singing somewhere amid the dissolving snow of the clouds, but cannot tell whether it is hidden among the blue that hangs below the floor of heaven, or amid the feathery silver that streams out like the wings of a mighty angel. Through

the vernal green of the grass you see the young daisies dawn, as if a new firmament was rising out of the earth, studded with another milky-way of unnumbered stars. The bleating of the young lambs falls upon the ear with a strange, dreamy sound, and you seem wandering through a newly-made world—a fresh formation, that has risen above the wreck and ruin of winter, and strewn the brow of its black, naked, and volcano-like front with flowers. You hear the babbling of childish voices in the winding lanes, and by the woodside; and there is a cheerful creaking of busy wheels on the brown and dusty highway, which fills the landscape with sounds of life, where before the snow lay like a winding-sheet over the muffled lips of the dead. The streams have broken asunder their icy fetters, and like liberated slaves, with the jingling fragments dangling about them, go dancing and singing down the steep hill-sides, and through the valleys, as if their only delight was in the motion that accompanied the sounds they made. The bees, like schoolboys broken loose, come buzzing out of the hives, and murmuring to each other as they hasten along, ransack every hidden nook in search of flowers, and wage war against the velvet buds; while those dusky and noisy foragers, the rooks, either sally out to ravage the wide neighbourhood, or stay at home, brawling and fighting, among the branches of their old 'ancestral trees.' The bark-peelers are busy stripping and felling in the adjacent forest, and you inhale the rich aroma as you wander along, and sigh when you think of the baked atmosphere which you are doomed to breathe in the burning summer of the city. If you ramble beside the clear river, there, in the willow holt, you see the busy osier-peelers at work, hear the rods whistling through the brake, and behold the tall taper wands spread out in the breeze and sunshine to dry. Field and farm, forest and river, hill and valley, are all alive, and throbbing beneath the stirring impulse of spring.

As the season advances, the day is cheered by the glad shouting of the cuckoo, and the silence of night awakened by the song of the nightingale; for as the voice of spring deepens, it is heard everywhere; and a hundred different choristers come from distant lands to swell the great anthem which is poured forth in our wild greenwoods.

Spring-time is the youthful season of the year; it passes its babyhood in the lap of winter, wrapped in its swaddling-clothes of snow; summer is the beauty of its full manhood; and autumn, with its yellow and fallen leaves, the old year in its age and decay. We have not that love for the flowers of autumn which we extend to those of spring, beautiful as many of them are; for we know that when they are withered and dead, nature must sink into a long sleep before others will grow up to replace them. With spring it is different: the violet and the primrose are quickly followed by the rose and the lily; and when the hawthorn has shed its pearl-tinted blossoms, the sweet woodbine appears with her crimson-streaked cheek. Yet if we love the flowers of spring more, we see them pass away with less regret than we do those of autumn. So with the loves and friendships formed in our youthful days; the broken and parting pangs seem more severely felt at the time, but they leave not the lingering regrets which make the heart empty and desolate in its old age. In the spring of our lives we shoot up amid sunshine and beauty, but bear no fruit; even that which hangs upon the summer of our manhood is green and crude, and scarcely worthy of being garnered until mellowed by the mists of autumn.

When shed and treasured, the season is again in its infancy; for spring leaps not up from the ashes of the dying year, but sleeps throughout the long night in the womb of winter. The child cannot begin with the knowledge we leave behind us when we enter the mysterious gates of the grave. There is a closer affinity between the out-of-door world of nature and ourselves than may at a first glance appear. The bud, the leaf, the flower, and the fruit, exhibit every stage of progression from infancy, youth, and manhood, to old age. The perfection of all intellectual growth is but a superior seed dropped into fruitful soil. The spirit of Shakespeare lives not when grafted on a dull human stock—the rose cannot take root in a heap of cinders and ashes—the mountain-heath withers and dies in the swampy soil of the reedy marsh.

There was a time when, to our own minds, spring brought but few associations, saving such as were connected with the lengthening of the days, the return of the singing-birds, and the coming again of the flowers. Even now, we can ramble throughout the whole livelong day, and divest our mind of all graver memories, contented to watch the shifting colours that fade over the landscape, and to burrow about the banks and hedgerows. But amid those grave and sable hours which slowly close the curtains of the midnight, almost every distinct object assumes a shape, and has a meaning; it becomes a part of one great whole, proving that

'The whole round earth is every way
Bound with gold chains about the feet of God.'

The sunshine of spring comes in light and gladness, and throws open hundreds of narrow courts and suffocating alleys in London; and in the warm mild evenings, you see the inhabitants congregated on the broad pavements of the open streets, or seated upon the kerbstones, or the steps around the mouths of those inhabited charnel-houses. The little, ill-clad, half-fed, dirty children are no longer driven to their pallets of straw or shavings at so early an hour as they were in winter. They now run riot in the streets, chasing each other like swallows, forgetting even for the time the pangs of hunger in the midst of their momentary happiness. The blessed sunshine, that God scatters like gold from heaven upon the rich and poor, even in these places, produces enjoyment not the less pure because unpurchased by the worldly man's standard of wealth. Many of these children are shoeless. After every romp, they have to stop to replace the little dirty frocks that have slipped off their thin spare shoulders: for every pull, and drag, and rent, they will probably, when they arrive at home, receive a blow; this they appear perfectly conscious of from the exclamations occasionally uttered; yet they 'bate not a jot of heart nor hope,' but run after each other with merry whoop and loud halloo, until summoned in by the shrill voices of their mothers. Many of them, during the daytime, had wandered from door to door, perfect in the very trick of the beggar's suffering look and canting whine, bearing a box of lucifers or a row of pins, under cover of which they escaped the vigilance of the police. It would be difficult to recognise these juvenile impostors amongst that merry group, were we not accustomed to meet them in 'their daily walks and ancient neighbourhoods.'

The village poor, amid all their poverty, can see the hand of spring at work as she hangs the tender green upon the branches, and scatters flowers of every hue over upland and valley. Unpoisoned by the malaria that rises from sink and sewer, the unadulterated air of heaven blows sweetly through the open doors of their thatched cottages, and there the morning sunshine comes streaming in, bright and beautiful as when it first issued from the golden chambers of the east. Instead of the waving of ill-washed garments, which send up an unhealthy smoke as they hang to dry in the city courts, the long leaves are talking to them all day long; and in place of the bawling of the costermongers, who from morning until night are ever breaking the peace of the

streets, their ears are greeted with the mellow pipings of the golden-billed blackbird, the music that gushes forth from the speckled throat of the throistle, or descends like a shower of melody from the clouds, where the twinkling wings of the skylark beat. The very child sent out to tend cattle in the long wandering lanes—who appeases his hunger by a hunch of brown bread, and quenches his thirst at the wayside brook—finds a hundred objects to amuse him in his solitude, and shuns all those numberless vices which lie in wait at every corner of our thickly-populated cities.

Unfettered, he can roam abroad,
And as he chooses pass the hours;
Can linger idly by the road,
Or loiter 'mid the wayside flowers:
For what cares he about the morrow?—
Too young to sigh, too old to fear;
He has no time to think of sorrow—
He finds the daisies everywhere;
And still sings through each green retreat,
And plucks the flowers around his feet.

ERMAN'S TRAVELS.

In 1827, Professor Hansteen, in pursuance of his researches in terrestrial magnetism, set out upon an expedition into the interior of Siberia, the expense of which was defrayed by the Norwegian government. The request of Mr Erman, already known in the scientific world, to be allowed a share in the undertaking, was complied with; and the results of his observations, both moral and philosophical, are now laid before the English reader by Mr Cooley.* Mr Erman's reputation is a sufficient guarantee for the value of the book. In 1844, he received one of the Royal Geographical Society's medals; the president, Sir R. I. Murchison, declaring, while he pronounced the adjudication, that with the exception of Humboldt himself, it would be difficult, if not impossible, to find a man more deserving of the honour. Supported by this authority, Mr Cooley, in the preface, very naturally launches out into the praise of his author, not only as a scientific traveller, but as a correct observer of manners, and appreciator of national character. To this, however, we have some demur to make, though not as regards Mr Erman's talents, but solely on the score of the inadequacy of his opportunities. In so rapid a journey, it was impossible for him to do more than skim the surface; and it was equally impossible for him to avoid the misapprehensions to which even the most talented traveller is liable in hastily traversing a foreign country. It is as safe as it is easy to praise where we are ignorant; but since 1827, much light has been thrown upon at least European Russia; and in the portion of the work referring to this region, we cannot say that we are struck by any great superiority on the part of our author over the common run of hasty travellers.

But some allowance must be made for the mere lapse of time; for the 'permanent form of civilisation' has no more permanence in Russia than elsewhere. Mr Erman's journey from St Petersburg to Moscow lay through a savage country, almost wholly destitute of inns or other conveniences for travellers; while only eight or nine years later, we ourselves rolled over the same tract in a diligence more comfortable than any we ever met with in France, dining at handsome restaurants by the roadside *à la carte*, and having our choice of French and German wines at various prices. All this was an agreeable surprise, as we had been forewarned by Dr Clarke that it would be madness to expect even clean straw for a bed. Had we taken this traveller's advice, we should have provided ourselves with a pewter teapot, a kettle, a saucepan, tea, sugar, bread, and meat; and on descending from the diligence to dine, we should

have astonished the natives by walking into their Parisian restaurants with a large cheese under one arm, and the lid of our saucepan under the other, to be used, according to the doctor's recommendation, as a dish!

But the difference between Mr Erman and other travellers on the character and position of the various classes into which the population is divided, cannot be ascribed to the revolutions of time. The dislike he supposes the Russians to have to intimate association with foreigners—the segregation of the women of the upper ranks—and the social position of the priesthood—are all mistakes which he has fallen into in consequence, no doubt, of the briefness of his sojourn, and the pre-occupation of his mind by other studies. The comparative isolation of the foreign mercantile class at St Petersburg is owing partly, no doubt, to the prejudices of the Russian gentry; but prejudices of a different kind from what Mr Erman supposes. It is the profession they dislike, and that alone—a fact which is proved by the very same barrier existing between them and their own merchants. The masses of the people have no avenue to the government service (the grand distinction of rank in Russia) but through the army. Trade, however successful, neither ennobles nor dignifies; and the wealthiest merchant may continue throughout his life a serf, paying his master an annual rent for his liberty to buy and sell. This explains the original isolation of the English factory, as it used to be called—an isolation kept up to this day by English prejudices as well as Russian. Our countrymen never mix thoroughly with the population anywhere. In the towns of France, Germany, and Italy, they are very nearly as distinct a class as they are in St Petersburg.

In Moscow, the foreign residents are chiefly teachers, and their intercourse with their employers is on a much more easy and equal footing than at home. But foreigners, who are neither merchants nor teachers, amalgamate as completely with Russian as with any other society; and more completely if English, because the heartiness of hyperborean hospitality breaks through the national reserve, and compels them to feel at home.

The kind of segregation of the women of the upper classes mentioned by our traveller exists to a less extent in Russia than in England. In the former country, not taking morning calls into account, which are comparatively rare, the reign of sociality commences at three o'clock—the general dinner hour; from which time till late at night all is flutter and freedom among the womankind. After dinner the company separate, but only to meet again, either in the same or some other house or houses, and the whole evening is spent in a succession of festive reunions. But on the other hand, the women of the mercantile class live in a kind of Eastern seclusion, drinking tea from morning till night, of which they imbibe, it is said, not less than from forty to fifty cups in the day. But the secrets of their prison-house are unknown, for the antagonism of classes is as strong on their side as on the other; and a noble would find it as difficult to join the domestic circle of a merchant, as a merchant would to seat himself at the table of a noble. The women, however, go to church, and on some occasions to the promenade, when their beauty, with which Mr Erman was so much struck, appears very remarkable indeed—as a work of art. The man of science was too much of a true philosopher to question so agreeable an illusion. He only saw the most exquisite complexions it is possible to conceive, and took it for granted that they were formed of nature's own red and white. Among the peasantry, again, there is more separation between the sexes (not seclusion), oddly conjoined with more intermixture, than perhaps in any other country. Custom does not prevent the women from bathing in the same pond with the men; but it generally prevents them from mixing in their dances or other recreations. You will see on the highways, near the villages, a group of bearded peasants dancing together with the utmost gravity, and at a few yards' distance a group of women similarly engaged,

* Travels in Siberia, &c. By Adolph Erman. 2 vols. London: Longman, Brown, Green, and Longmans. 1848.

neither party bestowing even a look upon the performances of the other. While mentioning the peasantry, we may as well say that it is not brandy, as it is called throughout the work, that is the common spirits of the country, but vodka, a liquor distilled from grain, and somewhat resembling, both in taste and weakness, the gin of the Londoners.

With regard to the churchmen, our traveller tells us that they do not form so distinct a group of the population as the other classes; the higher clergy intermixing with the nobles, and the lower with the tradesmen. This is quite a mistake. The higher clergy are monks of St Basil, sworn to perpetual bachelorhood, and they do not go into lay society at all. They confine themselves to their convents, where they live well, and wax portly, and (belonging by birth to the upper classes) are indeed the most gentlemanly-looking men in Russia. The lower classes, on the contrary, are part and parcel of the people. They must be married before they are ordained, and they are ineligible to the higher offices of the church. Though their functions are sacred, they and their families belong to the vulgar; and we have seen these clergymen, in their canonicals, go into the vodka shops of Moscow, and reissue while depositing gravely in their pockets a bottle of their favourite liquor. The religious feelings of the better class must have much decreased since Mr Erman's visit, since he tells us that a custom prevailed among them, which is rarely seen now, of offering adoration before meals to a crucifix set up in the room. The word crucifix we presume to be a mistranslation, for the Russians hold graven images in as much abhorrence as the Jews, paying their devotions instead before painted and gilded portraits of the saints.

The 'cautious reserve of the natives,' their 'shrinking from contact with a foreigner,' and their 'repugnance towards everything foreign,' are not merely unknown among the Russians of the higher class, but they are the very reverse of the fact. There is, in truth, throughout this order of society, to use the words of a more recent traveller, 'a sickly craving after everything foreign, and an unmanly affectation of scorn for everything native.' But while protesting against the book before us being received as high authority in anything but practical science, we would by no means be understood as being blind to the real merits of our author. Even leaving science out of the question, he is obviously an intelligent and accomplished man; he has a taste for the picturesque, and with good descriptive power; and, above all things, he has a sympathy with human nature even in its rudest condition, which throws a charm over the whole work.

In a work of such various and extensive information, the choice of subjects for notice is a difficult task; but we think we can hardly go wrong in devoting some little space to what many will deem rather a curious exposition of the economical importance of the Ural Mountains. Here, it seems, there are 132,000 tons of iron produced every year, four-sevenths of which are destined for European Russia, two-sevenths for Asiatic Russia, and one-seventh for the states on the south-west. 'The iron,' says our author, 'thus dispersed from the Ural would, if collected into one mass, constitute a sphere of only forty-seven feet diameter; and, if we assume the ores raised at five times the quantity of iron produced, we shall see that the diminution of the beds of the Ural will not exceed the contents of a sphere of 380 feet diameter in one hundred years. The result of this calculation will, as usual, only furnish another instance of the insignificance of human operations; for a globe of this size would not quite equal the dimensions of the Blagodat, as far as the ores are exposed above ground; so that many centuries must pass away before it will be necessary to go beyond the metallic accumulations which present themselves to view.' About the same value of gold and platinum is produced every year, and about one-fifth of the value of copper; giving of these metals the annual

amount of nearly five millions and a half sterling. To this must be added the produce of salt springs, rising through artificial borings carried into the lowest bed of the mountain limestone.

The magnitude of this branch of industry will be still better appreciated from our author's statement, that it would require 361 vessels of 400 tons each for the transport of a like quantity of minerals by sea. Here, with the exception of a comparatively small portion, it is distributed throughout the empire by means of river navigation, extending from Slatoust to the Baltic, or in an uninterrupted line of about 3350 miles. During 1000 miles of this route the boats have to struggle against rapid currents; and after all, they are prevented by the cataracts of Bronitsui from retracing their route, and on reaching the Baltic, are broken up as firewood for the denizens of St Petersburg.

The vessels used in this remarkable voyage are 120 feet long and 25 broad, flat-bottomed, with nearly parallel sides, and triangular though not sharp, both at bow and stern. Each fleet is attended by two pilot boats, and each of the larger vessels by a punt; all these vessels being constructed by the miners themselves during the winter. By the 20th of April the ice has disappeared from the rivers, and on that day the fleet, led, with flag flying, by a commodore vessel containing the owner or supercargo, leaves Slatoust; but not before a solemn mass is celebrated on the deck of the commodore, and the vessel blessed by the priest. Mounted attendants are stationed along the banks, receiving orders from the commodore, and salutes are fired as the residences of the Bashkir chiefs are passed. At night the fleet brings to, and the crew, all of whom are miners, sleep on shore, on almost every occasion surrounded by different scenery—now a narrow valley hemmed in by wooded hills, now an open plain, and again a gorge of bare calcareous rocks, sometimes rent into enormous columns, and sometimes hollowed out into caverns. At Satka an addition to the cargo is made from the magazines there, and the complement of men increased in proportion, to work the heavy oars at bow and stern. Nor is the work easy, for all sorts of difficulties beset the navigation, sometimes impeded by shoals and banks, sometimes by rocks and islands. But the light-hearted boatmen sing their way through all, knowing that they will be recompensed at night by the enjoyment of sitting round their watch-fires, drinking the sap of the birch, collected from notches cut in the trees, and playing their balalaika, or native guitar. These men, however, do not voyage far. The crew is diminished in number as the navigation becomes easier; and at Ufa the whole of the miners are sent home, and the vessels manned by hired Votyaks.

At Laishof a radical change takes place in the voyage; for here the vessels bound for Nijnei or St Petersburg must prepare to quit the smaller rivers, along which they had hitherto threaded their way, and to commit themselves to the broad waters of the Volga, the nursing mother, as it is called, of the Russian empire. They are now therefore rigged and fitted with a railing round the deck, each having a crew of thirty men, which gives employment altogether to 20,000 of the inhabitants of the neighbouring country. The ascent of the Volga is not facilitated by tracking with cattle. All is done by means of human labour, and the boats warped along by a windlass and hawser. At St Petersburg, as we have said, their history closes.

But this is not the sole trade the Russians carry on from the confines of Europe and Asia. In one direction they barter the goods of the western world with the Chinese; in another they collect the furs of the frozen regions of the north; and in a third they exchange productions with Western Asia. The last-mentioned trade is carried on chiefly with Bokhara; and some readers will wonder in what possible way a commercial character can attach to a barbarian state, without industry or resources, and a mere oasis in a desert of sand; and why 15,000 loaded camels should wend thither every year in

caravans from the surrounding countries of Asia. In a work published three years ago, Baron de Bode has solved this question, by pointing to the geographical situation of Bokhara as a central point of all the commercial routes between Eastern and Western Asia, and through which the chief products of that quarter of the world must be sent to Europe.* It is likewise the natural depôt of the southern countries, whose merchandise is sent to the north; and almost from the gates of its capital city the steppes begin which stretch to the Russian frontier. This remarkable oasis, together with that of Khiva, was formerly, according to the Greek and Asiatic historians, in a much more flourishing state than now; and in a memoir communicated by Humboldt to a German officer, the author of a work on Khiva, the writer speculates on the gradual desiccation (often referred to by other inquirers) of this part of Central Asia as one of the causes of the change.†

The present trade is described by Mr Erman at Troitsk, one of its Russian depôts, bordering upon the steppe of the free Kirgis. 'On the Kirgis side of the bazaar,' he says, 'may be seen, in worn-out and ludicrously-patched garments, the men riding upon camels and horses, the women on saddled cows; and the piercing cries of the camels, which are obliged to kneel down to be unloaded, are heard continually. The men are chiefly employed in selling the horses which they bring here in immense droves, and which are kept partly in a piling within the hall, partly turned out to graze in the steppe. The women, seated on the ground on the felt mats of their tents (kibitki), carry on the retail trade, and reckon their money. The Bokharians, Tatars, and Bashkirs, are said to deal fairly and peaceably with their brethren in religion, the Kirgis, and to find amusement in their peculiar loquacity. The contrast between the grave and circumspect demeanour of the Bokharian, sitting in his dark booth on the woilok cushion, waiting quietly for customers, and the savage boisterousness of the Kirgis, is said to be very striking. These more civilised merchants are even there always clad in the rich long khalat, while the greater number of the Kirgis go about in short jackets of horse-skin with the hair on, or in ragged cloths, and with the most clownish air.'

We now come to merchandise of a different kind. 'The conversation of a Kirgis belonging to our host, and who was a constant companion of our nocturnal trips in the sledge, contributed not a little to compensate us for our tedious disappointment while lingering in the lonely German churchyard. He told us how, when he was a lad of sixteen—and boding no good—he was enticed by his father from the steppe to the Siberian frontiers, and was there handed over to some Russian merchants in discharge of a debt of 180 roubles. He travelled with his new master to Tomsk, and being dismissed from thence, he entered immediately into the service of his present owner. The only tidings he had since received from his own home were, that his unnatural father had met with the punishment due to perfidy, being killed by some Russians with whom he had quarrelled. Perhaps, for the sake of the appearance of revenging himself on fate, the otherwise good-natured man related, with rare glee, how he, too, had renounced the children whom he had reared at Tobolsk from his marriage, and had given them into servitude to other Russians. Among the inhabitants of the steppes, the trade in the human being is ever a favourite business. Cases, however, like the present, which display an unnatural want of feeling in parents, are of rarer occurrence. Sometimes the eldest son, on the death of the father, gets rid in this way of his sisters, the support of whom devolves on him; the kidnapping of children is generally the work of families at variance, who thus take revenge on one another. The Kirgis, who are so numerous in ser-

vice in Western Siberia, and those in Bokhara and the other Khanats, have been all carried off in this way. Those Kirgis, in particular, who attend the merchants of Bokhara through the steppes, have quite a passion for kidnapping their neighbours' children; and it is said that, in consequence, whenever a caravan in the steppe passes through an Aul, or inhabited place, the mothers, with the anxious bustle of cackling hens, drive their children together into a felt tent, or kibitka, and there guard them from their itinerant fellow-countrymen.' The Russians, it may be supposed, who fall into the hands of these wretches are not on a bed of roses. 'Our Kirgis friend declared to me that he knew nothing of the custom, attested to me previously, and by most credible witnesses, as existing in the little horde, of knocking Russian prisoners dexterously on the head in such a way as to blunt their intellects, and so render them less capable of effecting their escape. But on the other hand, he described, as an eye-witness, a cruel practice, usual in his own tribe, and having the same object in view. When they have caught a Russian, and wish to retain him in servitude, they cut a deep flesh wound in the sole of his foot, towards the heel, and insert some horse hair in it. There is then no doubt that, even when the wound is externally healed; he will abide for the rest of his life, by a leading rule of Kirgis national manners; for as the Kirgis is always on horseback from choice, so the maimed Russian becomes a confirmed equestrian from the pain of walking.'

The Siberians themselves are described by our author as an enterprising and industrious race, bearing not a few of the characteristics of the New Englanders. As for the exiles, or convicts, as we should call them, they appear to be very well off, passing among the kindly Russians by the name of the Unfortunates. 'All these Unfortunates, as they are called, live in the town in perfect freedom; and with the exception of some newly-arrived exiles, who are obliged to do penance in church, they seem quite exempt from any special control or watchfulness on the part of the police. Many of the older ones do the same thing of their own accord, and doubtless from sincere conviction. These aged exiles pass over from the luxury of Moscow to the frugal simplicity of Tobolsk with true manly equanimity. They let their beards and hair grow; and, as they say themselves, they find the life of the Kosak and the peasant far more supportable than they once believed. Hence it is easily conceivable that the children, whom they bring up from marriages with Siberian women, totally lose all trace of so remarkable a change of fortune; and that the Russian nobility employed in Siberia in agriculture, hunting, or any other *promuiss*, are as little to be distinguished from their neighbours as the posterity of Tatar princes.' The exiles of the better classes are officers who have been guilty of fraud or breach of trust; while those convicted of state offences are sent nearer the Icy Sea.

In pursuing his journey northward from Tobolsk, our traveller found the comfort of the people greatly dependent upon their wives, who not only kept their houses clean and in good order, but were themselves distinguished by healthy and pleasant looks, neatness of dress, and hospitality. Near the arctic circle, the town of Bereasov was found steeped in that 'half-dark day' which, according to a Russian poet, has a magical charm for every nation of the north. A plain of snow and ice extended beyond, till it met the line of the horizon; the silence of the desert reigned in the twilight streets; and but for the smoke from the chimneys, the travellers might have fancied themselves in some city of the dead. 'It would be a great mistake, however, to judge of the interior of the snow-covered houses from the dreary and inanimate appearance of the streets; for instead of finding the people sunk in their winter sleep, one sees them full of hilarity and vigour, and willing to enjoy life. In conformity with the ancient Russian usage, the duty of entertaining the strangers was not allowed to fall on a

* Bokhara, its Amir, and its People. From the Russian of Khankroff.

† Memoir of the Countries about the Caspian and Aral Seas.

single family; but during a residence of five days in the place, I was continually moving as a guest from house to house. In the course of each day, the wandering social circle, as I may call it, kept continually increasing, my hosts of the preceding days always joining it, until at last the *posejunki*, or evening sittings of the men, consumed not a little of the long winter's night. One might spend years in this conversational life without wishing for anything better; for the weighty experience of many generations is here accumulated into a rich treasure, and the men who have collected, and who impart it, seem gifted in no ordinary degree. Nowhere else did I find among the natives so lively an interest in the objects of our journey; and it is entirely owing to the circumstance that many here had been instinctively led to meditate on philosophical questions, that, besides the geographical and magnetical observations, I obtained at Beresov much valuable information respecting the peculiarities of the climate, as well as the men and animals inhabiting the country around.

This would seem indeed a traveller's tale to one ignorant of the circumstances which combine to give so intellectual a character to a remote and isolated community almost buried in snow. But the blood of the Beresovians is mingled with the best in the empire; and the flower of the court and army—exiled generals and statesmen—have united with their Ostyak wives to raise a progeny distinguished at once by refinement and vigour. Then they are not always alone; for travellers from Tobolsk come frequently to give a fillip to their faculties with news of the busy world; and Russian crews—wild men of the icy Sea—make their way sometimes to Beresov, and pay for their winter quarters with stories of their adventurous lives.

Such is life in the far north; but our space warns us that we must conclude, at least for the present. As yet, we have only got through the first volume; and the second is full of interesting details of life among the Ostyaks, and of the intercourse of the Russians with the Chinese. On the latter subject we shall have an opportunity of comparing the observations of our author with those of Müller, Pallas, and other writers; and from such sources we shall hope to be able to lay before our readers a sketch both useful and entertaining.

'THE MERCIFUL' ESCAPE.'

AMONG the vestiges of former times remaining in the town of Dundee, is a wynd, or rather court, leading from the High Street, and known in native parlance as 'the Voults.' It is so called from being supposed to pass over extensive vaults belonging to an ancient monastery, whose site is no longer discernible; and the popular belief is in some degree confirmed by the hollow reverberations which its pavement gives back to passing steps or vehicles.

Time and fires have considerably diminished their numbers, especially of late years; but it is evident that the Voults was once as densely inhabited as city wynds were wont to be in the days of our ancestors; and those antiquated mansions, that look as if they had seen and never forgotten the devastating troops of Montrose, were occupied by the local rank and fashion of two hundred years ago. Since then, they have experienced the usual gradations of inhabitants, from anxious business down to reckless poverty. As the Voults is a kind of thoroughfare between two principal streets, some remnants of the former are still observable; but so late as the commencement of the present century, it was one of the busiest and most important localities in the burgh. At that time, which happens to be the period of our story, the lower flats in some of the cellars were appropriated to shops and offices, whilst the upper afforded habitations to operatives of every description, including the handloom weavers of linen cloth, which branch of industry was then new among the manufactures of Dundee.

The men of the loom in that neighbourhood were an industrious, intelligent class, though reckoned somewhat curious, and inclined to gossip; but there was no better specimen of these united characteristics in the order to which he belonged than James Wotherspoon the widower, who, with his only son and loom, abode for more than forty years in an attic room of Scrymgeour's Lând opposite the Hostel. Both these buildings are long ago numbered among the things that have been, but they were conspicuous at the period of which we speak. The former was a tall timber house of five storeys, with an outside stair and balcony, said to have been erected by a branch of the once powerful family of Scrymgeour before the Reformation, but in its last days inhabited by the poorer class of artisans; and the latter, a lower but larger and more solid stone fabric, traditionally reported to have served the different purposes of a chapter-house, a mansion of the Lindsay family, and an inn kept by a Flemish refugee, when there was no other inn in Scotland.

From the last-mentioned circumstance was derived the name which it retained through many a change of service, till at length, when the first French Revolution gave the news-reading world an impetus such as it never knew before, nor ever wanted since, the proprietor of a weekly paper, in high repute among local politicians, found more than sufficient accommodation for his establishment in the Hostel. A queer old place it was, with narrow windows, wainscotted rooms, and supernumerary doors in every corner, leading to winding passages and stairs, as if modes of egress and entrance had been the only study of the builders; but some of them were permanently locked up, and some forgotten, through the disuse of years. The people engaged about the 'Saturday Express' were thoroughly acquainted with the ways of their old-fashioned office, and it was believed the editor rather liked their intricacies, as they afforded no encouragement to the visits of strangers.

Whether owing to that cause or not, the office was rarely visited; but to one of the opposite neighbours at least it was an object of ceaseless interest and admiration, and that was James Wotherspoon. James was deservedly looked up to by the humble circle of his acquaintances, on account of superior attainments in the two great topics of their mental world—politics and theology: none could give a fuller account of the Sunday's sermon, or more clearly interpret a newspaper paragraph: he was acquainted with every popular work on divinity that had been published north of the Tweed for the last two centuries; could estimate the abilities and orthodoxy of every preacher between Tay and Don, and knew the political bias of all the notables of his time, from Pitt to the author of the 'Rights of Man.' Nor was his knowledge of those matters so surprising as it appeared to his simple companions, considering that the only hours of his waking existence which he spent off the loom were devoted to what he called 'studying the divines,' on which earnest pursuit a walk of ten miles to borrow an unread volume, or hear a celebrated preacher, was in his esteem as nothing; and the only coin he could or would spare, besides the purchase of life's daily necessities, was expended in subscribing for the Saturday Express, which he read every week, from the title to the last advertisement, at the rate of so many columns per day, to the great edification of his son and enlightenment of his neighbours, most of whom were content to receive the news of the day second-hand, and with explanatory notes by either of the pair.

A closely-resembling pair they were that father and son; and the Voults, in general, graphically expressed their sense of the only visible distinction by styling the one Big, and the other Wee Jamie, as their Christian names happened to be the same. Big Jamie was forty, and Wee Jamie was fourteen; but in size alone they were dissimilar: both were thin, muscular, and somewhat withered, with grave but curious faces, on which hard work, harder thought, and spare living, appeared

legibly written. In church each sat with the same reverent though watchful attention; in the streets each had the same cautious but rapid walk; and in the attic, where the one plied the shuttle, and the other wound the pirns or bobbins which supplied the woof, each wrought with the same air of determined and tireless industry. In modes of expression, shakings of head, and elevation of brows, the father and son were complete imitations of each other. The boy was a model of the man even in the matters of theology and politics; and a more regular, praiseworthy, but singular pair could not be found among the proverbially well-instructed artisans of their country. But there was one yearning which troubled the quiet of the Wotherspoons' days, like the repinings of Rasselas in the Happy Valley. The Saturday Express was their oracle—it was a Whig, and so were the two Jamies; they had read it with faith and understanding, week after week, from the first number, but they had never seen the interior of the printing-office. 'It's the temple o' science!' old Wotherspoon would exclaim, as he cast an adoring look from the attic window on the smoking chimney of the Hostel—the temple o' science, an' I may say the high place o' knowledge, from whence its glorious light is dispersed on all the nation. No but that there's mony mair o' sic fortresses built again' ignorance in Glasgow and Edinburgh, ne'er speakin' o' Lun'on an' the distant capitals o' Europe; but it fears me there's few papers filled wi' truth an' sincerity like the Saturday Express; an' to think that that mighty engine the Press is doin' its work for unborn generations at the tither side o' the Voults, an' us ne'er saw the powers o' printin' in actual operation!

'Mr Moodie's gay ill-willie to let in strangers,' responded his son to one of these outbursts. 'Sic folks shouldna be in places o' power an' trust; but Hirsalin' Jock, the deevil, telt me, in the speerit o' confidence, for clearing up to him how his majesty George III. had gaen clean wud, that his temper's amazingly mollified sin the plunderin' o' Loretto; an' we might hae a chance to see the work in a' its glory, if we wud jist step in some Saturday forenoon an' comport oursel's discreetly.'

'We'll try it, Jamie; we'll try it,' said his father with an emphasis that indicated resolution. 'Mr Moodie can do nae waur than refuse.'

It may be requisite to remark that Mr Moodie was the gentleman in command at the Hostel, whose partiality for the absence of visitors has been already noted; but after a long and minute discussion of the information imparted by Hirsalin' Jock—such being the Voults' sobriquet of a boy in the establishment—it was at length arranged between the greater and smaller Jamie that a bold attempt to see 'the dispenser of knowledge,' as the former styled the press, should be made on the following Saturday.

It was Wednesday when they came to this high resolve, and many a determined but anxious look was cast towards the Hostel from that till the appointed day: none of their neighbours were informed of the project—the Wotherspoons were too prudent for that, as they knew that failure was possible; but Jock had been waylaid, and catechised by the junior partner touching the possibilities of success in case such an enterprise were attempted, at some indefinite time; and his replies being satisfactory, the father and son rose from their loom at an unusually early hour on Saturday, equipped themselves as much in Sunday fashion as they considered advisable on a week-day, and proceeded to put their design in execution.

The Hostel was their goal; but by way of avoiding observation, and giving their courage time to rise, they trotted the whole length of the Voults and sundry adjoining streets, till at last, making a final sweep, they entered the mystic precincts in the train of a running newsmen. Keeping close behind him, the Jamies passed through a long wide gallery, a couple of empty rooms, and a flight of stairs with a door at the top, which ad-

mitted them to a large dusty apartment, where the broad and now wet sheets lay in piles, beside which several men and boys were at work, some folding, others putting on the covers, a pair of clerks were writing at a table in the centre, and a red-faced gentleman, loudly exhorting to haste, was pacing up and down when they made their appearance.

It was near the hour of issuing the paper, and all engaged on the Saturday Express were that day unusually hurried: the arrangements of newspaper offices were not then so perfect as at present; some delay had occurred in the transmission of intelligence, the compositors had blundered beyond correction in the leading article; and Mr Moodie, his official duties done, but still in the temper evoked by these trials, turned his eye on the elder Wotherspoon as he stood wondering at the scene, and demanded, 'What's your business?'

'My son an' me,' said Jamie, bowing reverently in the presence of literature, but still true to his resolution, 'jist cam in to see the glorious mystery o' printin'.'

'There's no time to let you see it now,' interrupted the editor. 'The hour of publication is almost past, and we are trying to get out a supplement.'

'Weel, I'm sorry,' responded Wotherspoon. 'I hae been a subscriber an' constant reader for a year and three-quarters.'

'Ah, indeed!' said Mr Moodie, manifestly softening. 'Well, just have the goodness to return in an hour or two, and you'll see it quite comfortably. Good-morning, sir.'

'Good-morning, and many thanks,' said Jamie, stepping, as he believed, to the door of entrance, which closed behind him and his son the next moment with a bang; and they hurried down the steps, determined to wait the leisure of the press in some of the rooms below. But both thought the staircase wonderfully darker than when they ascended.

'It's lang to get doon; an' guid guide us, there's nae room here,' said the boy, as they reached the last step, and found themselves at the entrance of a narrow and dingy passage.

'I doubt we're aff the gaet. They say the auld place is fu' o' holes and bores. But we'll no gang back to yon ill-grained craytor till the time's up. There's surely some door to be got,' said his father.

With this comfortable hope they entered the passage. It was long, and dimly lighted by small slit-like windows near the roof, which were thickly covered with cobwebs; and, as old Wotherspoon remarked, 'nane of the place was owre clean.' But it grew darker towards the end; and pressing forward with a kind of desperate fear, both felt, for they could not see, that their further progress was opposed by a strong and fast-shut door. The father seized the handle, and attempted to turn it with all his strength; but it would not move. 'Deil a bit o' us can get out,' said he, planting his feet more firmly on the floor, to give greater force to his second effort; but a cry of terror and amazement burst at once from father and son as the boards beneath them suddenly gave way, and both were precipitated fathoms deep into the darkness below. Fortunately the surface they reached was damp earth, and the boy's fall was broken by alighting on his father's breast.

'Guid be praised there's nane o' yer banes broken!' was the first exclamation of poor Wotherspoon, as his son, recovering from the first shock, scrambled up. 'But whar in a' the worl' are we?'

It was a most natural inquiry under the circumstances. They were in utter darkness; but by that keen perception which necessity sometimes calls forth in extraordinary situations, they soon discovered that the dull damp atmosphere which surrounded them was that of a wide and silent cavern or cellar, for whose bounds they sought in vain. Hand in hand the father and son groped and stumbled on, in hopes of meeting with either door or steps; but nothing could they reach but the damp earthen floor, with here and there a loose stone, a fragment of crumbling wood, varied with old bottles and

pieces of broken pottery. All fear of Mr Moodie and his subordinates was by this time swallowed up in greater terror. They raised their voices, and called for help with all their might; but the hollow and prolonged echoes that followed their shouts had something in them so overpoweringly fearful, that they were soon terrified into silence.

'Lord have mercy on us!' said the father. 'Jamie, dear, I doot there's nae earthly help for us. Do ye ken whar we are?'

'In the heart o' the auld monks' vaults, faither,' said Jamie. 'Listen, you's the street above us;' and the pair could now hear a rumbling sound overhead, like broken and distant thunder.

'Well, if it's the Lord's wull there will be a way of escape for us: let us pray to him,' said the father. And scarcely had he uttered this pious sentiment, when a faint gleam of light appeared in the distance, but only sufficient to give a dim idea of the vast extent around them.

'There must be some outlet, some chink there,' cried Wotherspoon; and his son uttered a cry of joy, which became dreadful in its echoes. 'Lord grant we may win tillt!', continued the old man, and both pressed on. Feeble as the light was—in fact the merest glimmer—it served as a sort of beacon for their sight, now in some degree accustomed to the darkness; but suddenly Jamie felt his father plunge forward, and at the same moment grapple at him with both his arms. The weight dragged him down, and the boy felt himself literally stretched on the ground, the extremities of his body resting on firm earth, and the middle portion grasped by the arms of his father over a deep circular chasm, in which the old man hung suspended.

'It's a well, Jamie!' cried the old man, flinging out his feet on all sides in search of some resting-place, no matter how small; but in vain. The mouth of the pit through which he had fallen was evidently covered with a large flag, having an orifice of something less than three feet in diameter in the middle. This the boy ascertained with his hands, which were still free; and a dripping sound far below, as of dust shaken down by their exertions, falling in deep water, proved too plainly that Wotherspoon's first idea was correct, and that he hung suspended over a deep old well.

'If I let you go, Jamie, do you think ye could fin' your ain way to the light, lad? Do you see it still?'

The boy replied with a shout of such wild and horror-stricken intreaty for his father to hold on, that the vaults replied as if with a hundred voices.

'Weel, Jamie,' said the father, when the fearful sounds died away, 'I canna haud lang; but the Lord might help us yet;' and both earnestly invoked that Providence on which the last hope of human nature hangs under all forms of faith and fortune.

'I see whar the light comes fra: it's in at a chink aboon a great stone pillar just beside us,' cried Jamie, interrupting a petition; 'an' here's a hole in it you could run a stick up just at my very fingers. Losh! but it's like the speaker's pipe in the wall o' Ramsay's Land.'

'Squeal up it, Jamie—squeal up it!' vociferated his father; and with an exhortation to keep a guid grip, the boy writhed himself round so as to reach the orifice, and bawled with all his strength, 'Help! help! my faither's droonin!'

'What's that?' cried the editor's clerk, who still remained in the business room with a couple of pressmen, winding up the last of the week's work, and rather anxious to get finished, as again and again from under his desk came a shrill whistling cry of 'Help! help! my faither's droonin!'

'It maun be the deil,' said the oldest of the men, making a stride towards the door. The clerk sprang to his feet and seized the desk, which was fortunately movable; the other man lent his assistance; but the voice still sounded on, and the clerk saw the paper, which happened to be loose on the wall, vibrate with

the sound. He tore it off in an instant, and discovered plainly the small circular opening of a speaking-tube in the lath and plaster, from which the cry proceeded.

'That weaver and his son haven't come back yet,' said the clerk, as an indefinite idea of the unused doors and the places to which they might lead, crossed him.

'No yet?' said the elder pressman, letting go the handle of the door. 'Do ye ken, sir,' he continued, pointing to one situated almost behind it, 'whar that leads? As I'm a leevin' man they went out of it; but Mr Moodie was sae awfu', I ne'er mintit to speak.'

'Then God help them, they have got into the old cellar, or maybe the vaults,' said the clerk; 'and how will we find them? Run and tell Mr Moodie, or the police. Hollo! where are you?' he shouted down the tube.

Never did a sound, of all the news they had heard in the course of their mortal existence, impart such joy to the hearts of the two Jamies as that brief inquiry. The father uttered a pious thanksgiving, and the son replied, 'Hingin' owre a well, and near the droonin', in the heart o' the auld monks' vaults!'

'Hold on, then, as long as you can,' responded the clerk, 'for there's help coming.'

Jamie uttered an earnest exhortation to all sorts of hurry, but none replied: the clerk had gone after his two assistants to alarm the neighbourhood. In a short time the more public parts of the Hostel were filled with the surrounding population, some with lights, some with ladders, and others with various weapons to break through walls and doors. The news had spread like wildfire 'that Big and Wee Jamie were smotherin' in the Vaults;' and the general esteem in which the Wotherspoons were held, was evinced by the eagerness of their neighbours for their assistance. But the most efficient help was that of the pressman already mentioned, who pointed out the door by which the pair had made their exit. The staircase and the passage beyond were speedily explored, and the light of some dozen lamps and torches cast on a wide trap-door, which still yawned above a broken and long disused ladder. More certain means of descent were soon procured, and a considerable party went down into what was supposed to be an old wine cellar, divided from the great vaults by old partition walls, which in many places had fallen away, leaving what seemed a boundless extent of 'darkness visible.' The lights reached Jamie's eye first, and the shouts of him and his father guided the searchers to where the former lay literally across the mouth of an ancient draw-well, supposed to be as old as the Hostel itself, and more than a hundred feet in depth; whilst the latter, with his arms tightly clasped round his son, hung suspended within a few feet of the water, which was afterwards found to occupy more than half its depth, having accumulated there, it was supposed, for centuries.

By means of ropes and willing hands, the pair were extricated from their perilous situation, and Jamie the younger pointed out the speaking-tube in the pillar, which had been the means of their deliverance. Why its opening was situated so near the ground, or what communications it was originally intended to convey, were mysteries which employed the speculations and surmises of the whole Vaults for some time; but the constructors had left no record, and the most ingenious conjectures were hazarded regarding the convenient proximity of the well to the wine barrels in the days of the good Fleming, from whose occupation the Hostel received its name: yet a complete solution was never obtained.

By special command of the proprietor, that unlucky door in the printing-office was finally nailed up; and after the tale of the Wotherspoons' mischances became public, Mr Moodie, to his entire satisfaction, was relieved of the visits of the curious. It was some days before James Wotherspoon and his son recovered from the exhaustion and injury consequent on that Saturday's adventure, but neither ever again returned to

'the temple of science.' It was even remarked in after-life that both entertained an unaccountable horror of printing-offices in general; and when such matters were mentioned, the father was wont to observe, with a long and deep inspiration, 'The press! ou ay, it's a mighty engine o' knowledge; but we had a mercifu' escape.'

PRE-CHRISTIAN ANTIQUITIES OF IRELAND.

THE superiority of Ireland in the cultivation of antiquities is gratifyingly shown in a small and unpretending, but intelligent and accurate, volume recently published.* While modestly taking rank as a guide-book, it is, in reality, the production of an elegant and highly-informed mind, from which the most original contributions to our knowledge might be expected. By its plan, moreover, it makes up for the narrowness of its dimensions. The kinds of antiquities are classed; the finest examples of each kind described, with beautifully-executed illustrations in wood; and thus, in a couple of hours, we rise with not only a good general idea of the aspect of Ireland as a field of antiquarian research, but some knowledge of almost every very remarkable object of the kind which it contains.

Ireland and Scotland are both rich in relics of the early heathen population. But the antiquarian spirit has scarcely yet awakened on our side of the Channel. We only know enough to see that a great similarity prevails among those antiquities of the two countries which relate to pre-Christian times. Mr Wakeman's first chapter refers to *cromlechs*, which abound in Ireland, as they also do in Scotland. 'A cromlech, when perfect, consists, of three or more stones, unhewn, and generally so placed as to form a small enclosure. Over these a large stone is laid; the whole forming a kind of rude chamber.' 'From the fact of sepulchral urns containing portions of calcined bones, and in some instances of entire human skeletons, having been discovered in connection with several, these monuments appear to have been sepulchres.' Similar structures 'exist in many parts of the world, even in the heart of India.' Appearing as the first and rudest form of the sarcophagus, it would be difficult to assign them too remote an antiquity. Such, probably, were the lonely tombs to which distracted people betook themselves, as described in Scripture. The common idea regarding them in Scotland is, that they were sacrificial altars of the Druids.

Pillar stones, called in the native language *Leaganns*, are common in Ireland as with us, being usually tall rough blocks standing alone in fields or moorlands. Mr Wakeman does not decide whether they are idol-stones, or monuments of events, or landmarks, all of which characters have been assigned to them. In Scotland they are regarded as memorials of chiefs who have fallen in battle. We can mention a particular worthy of note, which we observed many years ago, regarding two such stones, placed at the distance of a few hundred yards from each other in a moor near Dingwall in Ross-shire—namely, that they stood in a line due east and west. There is one preserved in Trinity College, Dublin, with an inscription in what is called the Ogham character—a voice of the far past, which no one can now interpret.

It affords some affecting considerations regarding Ireland, that amidst the struggles of its peculiar modern barbarism, the better spirits of the land may allowably rejoice in the vestiges of ancient, though it might be imperfect, civilisation, which show that it was *something* while yet England was nameless. To judge merely from the gold ornaments, necklaces, and bracelets, of not inelegant workmanship, which have been found in surprising abundances in the sister island, we might suppose its early people to have been no small way

advanced in the refinements of life. No one could read Mr Wakeman's account of the Newgrange Mound or Cairn, without retaining the impression that some great unchronicled history belongs to Ireland, as to some of the lands of the East, and to those of Central America. This mound, which lies four miles and a half from Drogheda, was opened in 1699, and found to contain a subterranean building of massive stones, accessible through a narrow passage. It is, in fact, a little hill, composed of a ruined edifice of a singular and primitive kind. A central chamber, on which the passage opens, is cruciform, and eighteen feet high; its sides and roof being composed of huge slabs, mostly covered with curious carving, representative rather of scrollwork than figures, and which evidently has been executed before the stones were put into their present situation. Two similar mounds, called the hills of Nowth and Dowth, exist near by; and in one of them, an internal chamber of much the same form and style of decoration has recently been discovered, containing many half-burnt bones of animals, some small shells, a pin of bronze, and two small iron knives. These curious structures, with their many decorations, are finely illustrated in Mr Wakeman's volume.

Many names of places in Ireland have Rath as their initial syllable; thus Rathdrum, Rathcoormac, Rathfurling, &c. 'Rath' is a Celtic word for 'fort.' It abounds in Scotland also, but usually with a variety of pronunciation—*Rait* (though sometimes *Raith*). In our country, where this circumstance is not generally known, we have several times ventured, with regard to places having the syllable *Rait* in their names, to predict that ancient forts would be found near them—for example, *Rait* in the Carse of Gowrie, and *Logierait* at the junction of Tay and Tummel—and the result invariably justified us. Probably the well-known farewell cape at the north-west angle of Scotland has a fort on its summit, and should be called Cape *Raith*. Such forts are usually mere earthworks, forming a circle, or set of concentric circles, on plain ground, or cutting off the outer angle of a bank overhanging a rivulet. The enclosure is supposed to have contained temporary buildings for residence.

The celebrated Hill of Tara, in the county of Meath, is covered with a cluster of raths, and presents few other objects. From an indefinitely early time down to the sixth century it was a chief seat of the Irish kings. According to Mr Wakeman—'Shortly after the death of Dermot, the son of Fergus, in the year 563, the place was deserted, in consequence, as it is said, of a curse pronounced by St Ruadan, or Rodanus, of Lorrha, against that king and his palace. After thirteen centuries of ruin, the chief monuments for which the hill was at any time remarkable are distinctly to be traced. They consist for the most part of circular or oval enclosures and mounds, within or upon which the principal habitations of the ancient city undoubtedly stood. The rath called *Rath Righ*, or *Cathair Crofinn*, appears anciently to have been the most important work upon the hill, but it is now nearly levelled with the ground. It is of an oval form, measures in length, from north to south, about 850 feet, and appears in part to have been constructed of stone. Within its enclosure are the ruins of the *Forradh*, and of *Teach Cormac*, or the House of Cormac. The mound of the *Forradh* is of considerable height, flat at the top, and encircled by two lines of earth, having a ditch between them. In its centre is a very remarkable pillar stone, which formerly stood upon, or rather by the side of, a small mound, lying within the enclosure of *Rath Righ*, and called *Dumhanna-n-Giall*, or the Mound of the Hostages, but which was removed to its present site to mark the grave of some men slain in an encounter with the king's troops during the rising of 1798. It has been suggested by Dr Petrie, that it is extremely probable that this monument is no other than the celebrated Lia Fail, or Stone of Destiny, upon which, for many ages, the monarchs of Ireland were crowned, and which is generally sup-

* The Hand-Book of Irish Antiquities. By William F. Wakeman. Dublin: James McGlashan. 1848.

posed to have been removed from Ireland to Scotland for the coronation of Fergus Mac Eark, a prince of the blood-royal of Ireland, there having been a prophecy that in whatever country this famous stone was preserved, a king of the Scotie race should reign. * *

'The *Teach Cormac*, lying to the south-east of the *Forradh*, with which it is joined by a common parapet, may be described as a double enclosure, the rings of which upon the western side become connected. Its diameter is about 140 feet.

'The ruins of *Teach Midhchuarta*, or the Banqueting-hall of Tara, occupying a position a little to the north-east of Rath Righ, consist of two parallel lines of earth, running in a direction nearly north and south, and divided at intervals by openings which indicate the position of the ancient doorways. These doorways appear to have been twelve in number (six on each side); but as the end walls, which are now nearly level with the ground, may have been pierced in a similar manner, it is uncertain whether this far-famed *Teach Midhchuarta* had anciently twelve or fourteen entrances. Its interior dimensions, 360 by 40 feet, indicate that it was not constructed for the accommodation of a few; and that the songs of the old Irish bards, descriptive of the royal feasts of Teamor, may not be the fictions that many people are very ready to suppose them. If, upon viewing the remains of this ancient seat of royalty, we feel disappointed, and even question the tales of its former magnificence, let us consider that, since the latest period during which the kings and chiefs of Ireland were wont here to assemble, thirteen centuries have elapsed, and our surprise will not be that so few indications of ancient grandeur are to be found, but that any vestige remains to point out its site.'

We did not intend to follow Mr Wakeman into the department of Christian Antiquities; but we are tempted out of our design by the Round Towers, which we believe have not been adverted to in this Journal since they ceased to be the mystery which they had been for many centuries. Our author does full justice to the profound learning and unwearied diligence by which Dr Petrie has at length made their purpose and history almost as clear as that of the churches with which they are invariably connected. The conclusions of that learned person are—1st, That the Towers are of Christian and ecclesiastical origin, and erected at various periods between the fifth and thirteenth centuries; 2d, That they were designed to answer at least a twofold use—namely, to serve as belfries, and as keeps or places of strength, in which the sacred utensils, books, relics, and other valuables were deposited, and into which the ecclesiastics to whom they belonged could retire for security in cases of sudden attack; 3d, That they were probably also used, when occasion required, as beacons and watch-towers.

For the one hundred and three Round Towers of Ireland, Scotland contains two—those of Abernethy and Brechin. The former is connected with a town well known to have been originally Pictish. The Picts, according to Mr William Skene's ingenious book, were the progenitors of the modern Highlanders, and therefore the same Celtic people with the Irish. All antique structures in Scotland are popularly referred to the Picts, particularly these towers, and a class of fort-like buildings in the north of Scotland, circular, half covered in with masonry, and composed of regular courses of stone well compacted, either by jointings or cement, these last being commonly called Picts' houses. It is as the relics of a Celtic civilisation that these things are chiefly interesting. In neither country do the same people, sunk as they are into a mere populace, though still retaining some fine traits, seem capable of such architectural efforts. Those who made towers and palaces then, make only hovels now. The days of torques, plates of gold, and elegant sepulchral urns, are long since gone by. A brutish multitude, feeding scantily on the meanest of food, is all that remains of a people who once filled Europe, and played in it a great

though unrecorded part. Strange destiny, which causes an old, and gallant, and ingenious race to fade and pine beneath the rule of a stranger, as if it had qualities which made it shine out masterfully while it stood upon its own resources, but in other circumstances set all to retrogression!

M. LOUIS BLANC'S ORGANISATION OF LABOUR.

M. LOUIS BLANC, now a member of the Provisional Government of France, is a young literary man, who joined the republican party ten or twelve years ago, when that party seemed to be on the point of extinction. He is known in this country as the author of a 'History of France during the Ten Years 1830-40,' but not until the occurrence of the recent events in France did another work of his—a little volume on 'The Organisation of Labour,' which he published originally in 1839—attract general attention among English readers. Of a very sanguine disposition, precocious in talent, and full of certain general notions regarding the amelioration of the condition of the working-classes, which had been widely propagated in France by two Utopian thinkers, Saint-Simon and Fourier, M. Blanc had cast these notions into a shape capable, he thought, of instant application to the existing state of society. Golden and beautiful in appearance, but utterly repugnant to the plain sense of practical men, and, moreover, wholly defiant of the principles which Adam Smith was supposed to have established, the scheme of the young *littérateur* provoked replies from a few of the political economists of France, and especially from the distinguished M. Michel Chevalier. Chiming in, however, with prevalent popular sentiments, M. Louis Blanc's proposition survived these attacks; and a few months ago, when publishing a fifth and augmented edition of his former treatise, he appended a very striking prediction, to the effect that, Utopian as his views seemed, the time when they should be realised was less distant from the hour at which he wrote than was the revolution of 1789 from the eve which preceded it. This prediction has been fulfilled so far, that the views in question are now at least on their trial in France, and this under the auspices of M. Louis Blanc himself. In this experiment all nations are interested. From the methods in which it is conducted, from the crashes to which it may lead, from the total failure, if it should come to that, or from the partial and modified success, disappointing to the projectors themselves, whichever may be the issue, we, as spectators, may derive profit. Meanwhile, in order to be able to look on intelligently, it is essential that we should understand the precise nature of the scheme, and the precise hopes and feelings with which it is connected in the mind of its author.

The fundamental maxim upon which M. Blanc proceeds seems to be this: 'That wherever the certainty of being able to subsist by labour does not result from the very essence of the social institutions that are established, there iniquity reigns.' This maxim, it will be perceived, is equivalent to an assertion that the sufferings which afflict, and have always afflicted mankind, do not result from any inevitable necessities in the nature of things; but only from human perversity and misunderstanding—from the adoption and perpetration of false modes of government, and ineffectual social arrangements. Accordingly, the doctrine of the ephemeral nature of evil, and the perfectibility of human society, is expressly maintained by M. Louis Blanc. 'There are men,' he says, 'who do to God this outrage, to affirm that evil is immortal. Is this your thought? With such a doctrine, you go to the denial of all progress. For by what right do you affirm that it is only a third, or a fourth, or a fifth part of evil that it is given to man to destroy? By what right do you fix, on the road of progress, the limit which it is permitted us to reach, but not permitted us to pass? Do you believe

in progress—yes or no? In the first case, I defy you to assign its limits; in the second, I give up arguing with you. It is the custom to charge almost all our misfortunes on the corruption of human nature; we ought rather to accuse the deficiency of our social institutions. Look around you: what aptitudes displaced, and consequently depraved! What activities become turbulent, because they have not found their legitimate and natural outlet! Our passions are forced to act in an impure medium—they become changed: is there anything wonderful in that? If a healthy man is placed in a pestilential atmosphere, he will respire death. "Our nature," M. Guizot has said, "carries within itself an evil which escapes all the efforts of man. The disorder is in us. Suffering, unequally allotted, is part of the providential laws of our destiny." This, then, is the philosophy of our opponents! The fallacy which lurks in this swift and fluent reasoning of M. Louis Blanc, it is not difficult to discern. That there is a progress in human affairs, all history shows, and all thinking persons admit; that it is in the power of social institutions to accelerate this progress on the one hand, or retard it on the other, is a proposition which we take for granted in our daily gossip and grumblings, and a firm belief in which is at all times desirable; but that misery originates solely in misunderstanding or mal-arrangement on the part of man, or that even under any conceivable form of society it shall cease to exist, is a mere chimera. 'There is in man a liability to do wrong, knowing it to be wrong,' is a fundamental fact, revealed to every individual by his own actions, and by those of other men; and in this fact alone—even if we reject the disheartening theory of Malthus, which asserts the existence of another constant drag upon all efforts at amelioration in the very constitution of the race, physiologically considered—there is sufficient strength to throw the advocates of absolute perfectibility back in their calculations. Nevertheless, this very sanguineness of some men in the effect of good social arrangements to abolish suffering, renders them most useful members of any community to which they may belong; and when publicists of ability, like M. Louis Blanc, come forward to point out social wrongs, and propose remedies, they deserve a hearing, even from those whose faith is more tempered with discretion.

A large portion of the sufferings of the human race have their origin in pecuniary destitution, or the fear of it. Could all the pangs, anxieties, sorrows, melancholies, &c. which at any given moment exist, diffused through the world's population, be collected, and, as it were, amassed into one sum-total, part of the mass would be reducible to the mere fact of the *uncertainty of subsistence*; while the rest would consist of ordinary bodily ill-health, and of those vague and miscellaneous maladies and miseries which constitute 'the mind diseased,' to which no one can minister. The relative proportions of these two parts it is impossible to determine; but in the thoughts of M. Louis Blanc it is evident that the former is the most bulky. To abolish all that portion of human misery which originates from want, or the uncertainty of subsistence—to secure, in short, that every human being who is born into the world, and who is willing to work, shall move in it freely and comfortably, so far as material means are concerned—this is an enterprise which he thinks not at all beyond the compass of existing social science, and he endeavours to demonstrate the fact in the volume before us. That once accomplished, however, he would probably attack even those miseries which originate in other causes than want or the uncertainty of subsistence—he would combat disease, for instance, with a larger sanitary science than has yet been dreamt of—and seek to abolish moral gloom by the methods and resources of a new art of education. Such at least were the aspirations of Fourier, of whom M. Louis Blanc may be regarded as virtually, although in a modified fashion, a disciple.

The great social evil of the age, M. Louis Blanc contends, is the system of competition, or, as he sometimes calls it, individualism, upon which all business is conducted—the system, namely, according to which every man engaged in any occupation tries, by his own private means and energies, to outwork and undersell his neighbour, so as to leave him behind in the market. Regarding this system of mercantile competition, he undertakes to prove—1st, That for the masses, it is a system of extermination; and 2d, That for the middle classes, it is a constant cause of impoverishment and ruin.

He opens with a case strongly represented. 'Is the poor man a member of society, or is he its enemy? Let us see. Everywhere around him he finds the soil occupied. Can he sow the earth on his own account? No; because the right of the previous occupant has become a right of property. Can he pluck the fruits which God causes to ripen in his path? No; because, equally with the soil, the fruits have been appropriated. Can he devote himself to the chase or to fishing? No; because this, too, constitutes a vested right. Can he draw water from a fountain enclosed in a field? No; because the proprietor of the field is, in virtue of the right of accession, proprietor of the fountain. Can he, dying of hunger and thirst, stretch forth his hand for the pity of his fellows? No; because there are laws against mendicancy. Can he, exhausted with fatigue, and in want of an asylum, lie down to sleep on the pavement? No; because there are laws against vagrancy. Can he, fleeing from this homicidal country, where everything is denied him, go to ask the means of subsistence far from the spot where he was born? No; because it is not permitted him to change his country, except on certain conditions, which he cannot fulfil. What, then, shall this unfortunate do? He will tell you, "I have arms, I have intelligence, I have strength, I have youth; take all these, and in return give me a little bread." This is what the labouring classes say at present. But here also you may reply to the poor wretch—"I have no work to give you." What, then, would you have him do? The answer is very simple: *assure work to the poor*. Even then you will have done little for justice, and the reign of fraternity will still be far off; but at least you will have averted frightful perils, and cut short revolt. Have you well considered? When a man who asks to live by serving society is fatally reduced to a position in which he must attack it, on pain of dying, he is, in this state of apparent aggression, really in a state of legitimate defence; and the society which strikes him down does not judge him—it assassinates him. The question, then, is this—Is competition the means to *assure work to the poor*? To put the question thus is to answer it. What is competition as it respects the labourer? It is work set up to auction. A master has need of a workman: three present themselves. "How much do you ask?" "Three francs a-day: I have a wife and children." "Well, and you?" "Two francs and a half: I have no children, but I have a wife." "Very well, and you?" "Two francs will satisfy me: I am single." "Then you have the preference." Thus it happens, and so the bargain is made. What becomes of the two rejected workmen? They will let themselves die of hunger, it must be hoped.' Pursuing this strain, M. Louis Blanc traces to competition, as its cause, the misery of the working-classes of Paris, which he exemplifies in a table, exhibiting the rates of daily wages received by persons employed in the various trades of that capital. Amongst thirty-eight female occupations, the highest wages are 11s. a-week, the lowest under 3s. Of the trades followed by men, which are about twice as numerous as those open to women, those in which the largest wages are earned are the carpenters, slaters, and plumbers, who make 4½ francs a-day (upwards of a guinea a-week), but are idle four months of the year; and the glass-blowers and brassfounders, who make 4½ francs a-day (a little more

than a pound a-week), but are idle three months of the year. Those in which the rate of wages is lowest are the pork-butchers and the hairdressers, who earn, the former a franc a-day (3s. a-week), with board, during about eight months of the year; the latter 85 centimes a-day (upwards of 4s. a-week), with partial board and lodging, during the whole year. 'What tears,' says M. Louis Blanc, referring to these tables of wages, does each of these figures represent! What cries of anguish, what stifled curses! Behold in this the condition of the people of Paris—the city of science, the city of the arts, the glittering capital of the civilised world! In other French towns, he says, the state of things is even worse. At Nantes, for instance, the total yearly income of an average family of the poorer labouring classes is estimated, by an authority from whom he quotes, at only 300 francs (L.12). Of this sum, 25 francs (L.1) are paid away in rent, 12 francs (about 10s.) for washing, 35 francs (L.1, 8s.) for fuel, 12 francs (10s.) for shoes, and 5 francs (4s.) for repairs and removal. Deducting these, and some other expenses, and supposing medical attendance and drugs to be afforded gratis, and the clothes worn to be given in charity, 'there remain but 196 francs (about L.8) to purchase a year's food for four or five persons, who would require at least, stinting themselves to the utmost, 150 francs for bread alone. Thus there are only 46 francs (not L.2) left to purchase salt, butter, greens, and potatoes, not to speak of meat, which they never use.' All this, M. Louis Blanc contends, originates in the false and remorseless system of mercantile competition.

If the system of competition is thus the cause of misery among the poor, it is no less, says M. Blanc, a source of mischief and ruin to the middle classes. '*Good bargains*—such is the word in which, according to the economists of the school of Smith and Say, all the advantages of competition are summed up. But why persist in considering the results of *good bargains* otherwise than relatively to the momentary profit of the consumer? Good bargains do not profit those who consume, otherwise than by throwing among those who produce the germs of the most ruinous anarchy. Good bargains are the bludgeon with which the rich producers knock down those who are less easy in their circumstances. Good bargains are the pit into which hardy speculators cause laborious men to fall. Good bargains are the death-warrant to the manufacturer who cannot make the advances on a costly machine which his richer rivals are able to make. Good bargains are, in one word, the destruction of the middle classes for the benefit of a few industrial oligarchs.' As the most notable example that the world has seen of the effects of the system of mercantile competition, M. Blanc cites England. 'To produce, ever to produce, and by all means to solicit other nations as consumers of her goods, this is the work on which England employs her force; it is by this that she makes her wealth, by this that she develops the genius of her sons.'

'A day,' he adds, 'could not but arrive when the nations consuming her goods would find no more material to give in exchange; from which the result for England would be glutted markets, the ruin of numerous manufactures, the misery of crowds of workmen, and a universal upsetting of credit.' That this day has already nearly come, M. Louis Blanc goes on, in his hasty way, to prove by a few sweeping allusions to the condition of England, both material and moral. In every case of British bankruptcy he sees the providential punishment of the crime of mercantile competition. Nay, our sombre character and cast of countenance is but a moral chastisement for the same national offence. 'The riches,' he says, 'of these great English lords leave them a prey to I know not what vague melancholy; a malady sent by God upon the great of the earth, whereby they also may be made to succumb to pain; pain, that imposing and terrible lesson of equality! What do they actually possess, in the midst of their luxuries, these haughty lords? Bitter thoughts and eternal

restlessness of heart! They must fly the mists of their own isle to scatter their gold again in all the places whence it was drained, and there to drag about with them the burden of their wearying opulence.'

Having, as he thinks, exhibited the evils of the competitive system, M. Louis Blanc proceeds to expound his method of social reform: This consists in the application to all trades and occupations of the co-operative principle, or the principle of partnership. Of this principle most of our readers are doubtless aware M. Blanc is by no means the original advocate. First vigorously expounded and enforced in France by the celebrated Fourier about thirty years ago, it has since been a theme of disquisition for various writers both in our own country and on the continent; and in a previous number of this Journal, we were able to give an account, the fullest that has yet been presented to the English public, of an interesting experiment in which the principle in question was put in practice on a small scale, and for purely private ends, by an enterprising Parisian tradesman.*

The peculiarity of M. Louis Blanc's views consists in the important part which he wishes to assign to the state in the conduct of all national industry according to the new or co-operative method. His ideas, however, will be best understood from the following summary of them in his own words:—'Government should be considered as the supreme regulator of production, and invested as such with the necessary powers. Her task would consist in employing the weapon of competition in order to destroy competition. Government should raise a loan, and employ the product of it in the creation of *social workshops* in the most important branches of the national industry. As this creation would require considerable funds, the number of workshops should at first be limited; by virtue of their very organisation, however, they would possess an expansive power. Government being considered as the sole founder of the social workshops, would have the right to draw up the rules and regulations. There would be admitted to labour in the social workshops, so far as the capital subscribed would go to purchase tools, &c. all such workmen as could give guarantees of good conduct. Notwithstanding that the false and anti-social education given to the present generation renders it difficult to find any other stimulus to exertion than in an increase of reward, the *salaries of all the workmen would be equal*, as a totally new education would necessarily change ideas and habits. For the first year government would regulate the hierarchy of functions—that is, appoint the foremen, &c. After the first year it would no longer be so. The workmen having had time to appreciate each other, and all being equally interested in the success of the association, the hierarchy would proceed on the elective principle. Every year there would be rendered an account of the net profits, of which there would be a triple division—one part to be shared equally among the members of the association; another to be expended, 1*st*, in the maintenance of the aged, the sick, the infirm; and, 2*d*, in the mitigation of crises befalling other trades—different trades owing each other this good service; and the 3*d*, to go to purchase tools for such new members as wished to join the association. Into each association famed for great trades might be admitted persons belonging to trades which must, by their very nature, be scattered and confined to spots. In this way each social workshop would come to consist of different professions grouped round some great leading trade, as separate parts of one whole, obeying the same laws, and sharing in the same advantages. Each member of the social workshop would have the right to dispose of his income as he thought fit; but the evident economy and undeniable superiority of the barrack life would soon lead to an association in wants and enjoyments, as well as in labours. Capitalists would be invited to join the association, and would draw the

* M. Leclaire of Paris. Journal, new series, No. 91.

interest of what capital they chose to invest; but they should not partake of the profits, except in the capacity of workmen.

By introducing such a system in any country, first into a few of the principal branches of industry, and then gradually into all, M. Blanc believes that a social revolution would be effected most admirable in its results. Distress and want would disappear—all classes of society would be bound together by new and beautiful ties—and a progress would be made in science, in the arts, and in morality, of which as yet we can form no conception. With these views, it may be supposed with what alacrity he entered on the post which he now occupies, and in which he finds himself at liberty, under certain restrictions, to attempt in practice the novelties which, nine years ago, he projected in theory. State workshops are now on trial in France.

What may be the result of this experiment, and how far its failure would affect the soundness of the general principle of co-operation in industry, of which Louis Blanc's scheme is but one somewhat *bizarre* modification, we need not here consider; nor—our object having been rather to expound M. Blanc's views than to criticise them—need we enumerate those points in which they seem to run counter to the established principles of economical science, and the laws of human nature. An extract, however, from a review of M. Blanc's work by his most distinguished opponent, M. Michel Chevalier—himself a man of large and philanthropic views—will serve to suggest to the reader wherein the special weakness of M. Blanc's scheme lies. 'The mother-ideas of M. Louis Blanc,' says M. Chevalier, 'which appear every moment in his book, are these two—1st, Human societies may govern themselves principally, if not absolutely, by the sentiment of duty. Personal interest is only a resource of secondary importance; social and individual progress, the development of public and private prosperity, do not require that this sentiment of personal interest be called energetically into play. It is not necessary to excite it directly; an indirect allurements will suffice. Hence M. Louis Blanc concludes that his *state workshops* will flourish, since the members of the workshop shall have only a collective, and not an individual interest—an indirect, and not an immediate interest, in acquitting themselves well. 2d, The definitive term of societies is absolute equality. We already touch this goal; one more effort, and we are at it. Consequently, at a period close at hand, all men may be paid equally. Now these two mother-ideas are radically erroneous. Every social system founded on them is chimerical. Human nature is adverse to the conception of M. Louis Blanc. "So much the worse for human nature," he may tell me. It may be so; but so much the worse at least for your plan! Take men as they are, not as you wish they were. In the mind of the great majority of men, and in the greatest number of circumstances, the sentiment of personal right is superior to that of duty; the thought of interest dominates over that of sacrifice. The immediate and direct desire of individual advantage is a force incessantly acting; suppress it, and industry languishes. Without this, no more progress in the arts, no more ardour among workmen. Law and religion preach to men duty, and glorify self-sacrifice; and we owe them gratitude for this. Society would be lost were the sentiment of duty extinct. It would fall into rottenness if self-sacrifice and self-denial were not honoured among men. But the sentiment of *right* preaches itself; on this point each of us is his own deryman, and finds in himself a docile pupil. It is only the chosen few that are otherwise constituted. Raise statues to Cincinnatus, offer palms to the martyrs; but do not hope that in practical life, and in questions of daily bread, the human race will take their self-denial for a model. Nay, even they themselves, in ordinary transactions, acted on the common principle. Again, to interpret the idea of equality, so as to make it mean identical remuneration for all men, is to misunderstand man and history. True equality—that

which our fathers proclaimed in 1789—consists in effacing the political inequalities founded on the right of birth. National education ought to have for its object to seek out everywhere, in hamlets as well as in cities, in the thatched cottage as well as under the roof of the wealthy, the superior natures of which society has need, in order that affairs may be well conducted. But the proposal to submit to the same material existence all men without exception, supreme magistrates as well as the most humble operatives, is one of those chimeras which are hardly permitted to the schoolboy, whose imagination dreams of Spartan black broth the moment that, having quitted the confectioner's shop, he is no longer hungry. This were not equality—it were the most brutal inequality, the most odious tyranny. Imagine in one of those barracks where the labourers—that is to say, all the citizens—are to lead the common life which M. Louis Blanc offers them; the prince or chief magistrate of the state, the cabinet ministers, the chief judges, the masters of trades, eating in the common mess-room the universal pittance, relaxing from their high cares in the common barrack-yard, and at the same games as the herd, meditating on the destinies of their country, and the general interests of society in their numbered apartments, having around them, by way of inspiration, kitchen utensils and squalling babies.' M. Louis Blanc, who has replied to these arguments of M. Chevalier, complains that they do not fairly represent his case. We shall perhaps return to the subject, when an opportunity may be afforded of considering how far this is true.

FARMER TREMAIN.

THE incident related in the following slight sketch is characteristic of the peculiar people and interesting district of the 'far west' of England, where I resided for two years, domiciled in a solitary cottage, beautifully situated on the slope of a deep valley.

I was sitting in the embrasure of a bay-window, which commanded a lovely prospect of hill and vale, wood and water, with a peep of the town and its church spire in the distance, when the sound of many human voices, chanting a solemn hymn, broke on the silence of the still summer afternoon.

The voices arose from the opposite side of the valley, where I beheld a cavalcade of men, women, and children, some in carts, some on horseback, but mostly on foot, reaching from the bridge to about midway up the winding ascent. At that point the road widened a little, and there was a large flat stone, covered with moss and lichens, around which a crowd had collected, the men with their hats off, the women in various attitudes of devotion, but all joining earnestly in the sacred service.

It was a funeral procession; and after a more lengthened sojourn in that peaceful valley, I found the ceremony one of constant recurrence; the winding road before named leading to the burial-ground of the widely-extended parish, and the flat stone on the hill-side being the usual resting-place for the weary bearers with their coffined load. On the present occasion, I found that some curious circumstances attending the death of the deceased, had rendered the 'wake,' as it was called, a spectacle of more than usual interest in the country side.

Farmer Tremain, for fifty years, had lived on the small but flourishing patrimony, with its substantial homestead, which had descended to him from his fathers; he was a popular and jovial personage, much respected by his neighbours, who consulted him on all occasions of emergency. He had never travelled twenty miles beyond his native farm, so that his sagacity was

homespun, and his knowledge of human nature must have been pretty nearly intuitive. He had a prudent wife and goodly children, and was contented and happy; till, on an evil day, he was tempted by a speculative proprietor to take a share in the deserted mine of Wheal Rose—a mine which had been abandoned on account of water gaining ground, and the produce not equalling the outlay required; but which some wise heads, and Farmer Tremain's into the bargain, determined to patronise once more, in the mysterious belief (for they could not explain the *why*) that an undiscovered lode of rich ore lay concealed beneath. It was indeed whispered abroad that Farmer Tremain had recourse to the forked branch of hazel, which, on being loosely held in the hand of the searcher, points downwards wherever ore is beneath the earth's surface; thus indicating the exact spot where the hidden treasure is to be found.

Farmer Tremain was a prudent man, and he took care not to involve himself very deeply; but the mine was fourteen miles away from his dwelling, and he harassed himself, and rode backwards and forwards on his good horse Dobbin in all weathers: he superintended the few miners set to work, and overlooked the accounts, in the shed dignified by the name of 'counting-house'; and continually got wet through, as the subtle mist gathered over the dreary hills, and, unlike legitimate down-pouring rain, renders all usual protection unavailing. Dobbin was a steady-paced, slow beast, though he had been known, once or twice during a course of years, to take extraordinary freaks into his Roman-nosed head, on occasions of sudden alarm, when he set off like a mad creature.

It was on a dark howling winter's night that Farmer Tremain mounted his sturdy horse, and gladly turned from Wheal Rose on his homeward route. A heavy mist had been falling all day, and the clouds were driving across the sky, scarcely permitting the moon at rare intervals to peep forth. The wayfarer on those lonely barren hills could not see a yard before him; and perchance he thought of his comfortable home and blazing hearth—of his kind comely dame and his rosy daughters—and wished to be among them, instead of where he was, with so long, cold, and cheerless a ride before him. Perchance, too, he wished that he had never been induced to engage in the turmoil and anxiety of mining speculation, but had been contented with his humble lot and hard-worked-for gains.

However this may be, he jogged forwards, perhaps about five miles on his way, when suddenly Dobbin stood still, began to snort in an unusual key, and positively refused to move another step; on the contrary, backed in such a determined manner, that neither coaxing, exhortation, nor whipping succeeded in changing his obstinate resolution. What was to be done? It was very strange, for Dobbin never took such whims into his head for nothing. So Farmer Tremain dismounted, and endeavoured to lead him: but he tugged and tugged in vain—Dobbin planted his forefeet firmly, and remained immovable. As the farmer was struggling with the refractory animal, his foot struck against something which sounded hollow on the middle of the road; but it was so dark just then, that he could not discern what the obstacle was; so he stooped down to feel, and as he passed his hands over its length and breadth, his blood curdled—for it was a coffin. Farmer Tremain was a superstitious man, as are all his people; but he had strong nerves, and was not easily frightened or daunted: so he patted Dobbin's Roman nose, and spoke encouragingly to him, for the poor creature was shivering strangely. He then succeeded in striking a light, the materials for which he always carried about him; and with the help of the moon, which emerged from behind the dark clouds, and cast its partial light on the scene, he saw that it was a common black coffin, evidently made for a full-grown, large individual. After pausing a moment, he opened it: it was empty. 'I

will see *who* it be for though,' quoth Farmer Tremain bravely, as he with some difficulty traced the inscription on the ordinary plate, which ran thus—'John Tremain, aged fifty years.' His own name—his own age!

He gasped for a moment, and his eyes started in their sockets, glaring almost as wildly as did the horse, which, with protruding eyes, distended nostrils, and ears thrown back, exhibited every symptom of terror and abhorrence. Farmer Tremain's sensations were very odd; and he longed for a glass of brandy, as he remembered there was a wayside house of refreshment a little way further on to the right: so privately arranging in his own mind to call there, he began to work himself into a towering passion with Dobbin, who strenuously resisted all efforts to urge him across the dismal barrier. Yet his master could not muster up sufficient resolution to place it on one side, for it lay entirely across the narrow road, and the horse must leap over it.

Excited, angry, and not knowing very well what he did, Farmer Tremain, making a step of the coffin, bounded on his horse, exclaiming, 'Thee shalt taste the butt end, Maister Dobbin!' at the same time striking the animal with all his force repeated and violent blows on the head and shoulders with the heavy handle of his whip. In a moment afterwards the fearful obstacle was cleared, and Dobbin rushed recklessly forward, as he had never rushed before, and probably never did again.

But Dobbin reached Tremain farm alone, panting, bruised, and covered with blood and foam. His unfortunate master was found about three miles from home, where, on some granitic rocks by the roadside, he lay apparently dead. It was supposed that he had been dragged along for a considerable distance, after he was thrown by the panic-stricken horse, which at length stumbled, and rolled over him. Farmer Tremain recovered speech and recollection for a while, sufficiently to explain and comment on the 'warning' which he believed himself to have received; and also to lament his passion and ill-judged harshness towards the faithful steed which had borne him safely for so many years. But the 'warning' was explained to the sufferer ere he breathed his last; which sad event took place a few days after the accident occurred. It seems that the bearers of the coffin, which had been the cause of so much mischief, being slightly inebriated, had heedlessly left it on that lonely road, while they repaired to the nearest alehouse, little dreaming that any one would pass the unfrequented way at so late an hour. Had Farmer Tremain mastered his superstitious dread, kept his temper, and pushed the empty shell aside, his scared horse might have been led quietly past; and as he would in all probability have sought the same refuge as these men, for the same 'consolation,' the whole would have been satisfactorily explained. The coincidence of the name was by no means singular, it being a common one in that part of the country: the coffin was intended for a labourer just deceased, whose solitary hut was within a mile or two of the spot, and whose age happened to correspond with that of his namesake.

Such was the recital I listened to, and it was the crowded wake of Farmer Tremain which I had witnessed; but the singular circumstances attending his melancholy end were not so easily disposed of by the wonder-seeking peasantry. To reason or to argue was robbing them of a pleasant error, and of an added legend to the general stock; and on that balmy summer afternoon, when I first heard the hymn chanted over the dead, on the hillside of our peaceful valley, I am sure that the eyes of the assembled throng traced the inscription of 'John Tremain, aged fifty years,' on the coffin-plate with sensations of unusual awe and undefinable apprehension. I remember thinking at the time that here was another proof, if proof were needed, of the baneful effect of superstitious fear acting on an unlettered mind; and that it involved an impressive

lecture respecting patience and kindly treatment towards dumb creatures, and the evil of giving way to the impulse of passion.

PERUGINO.

'THE life of Piètro Vanucci, commonly known by the name of Perugino, proves,' says an Italian author, 'that poverty does not always act as a check on genius.' He was born of indigent parents at Citta-Della-Piève in Italy, A.D. 1446. His early days were passed in want and suffering: nevertheless, it appears that his friends found means to bind him apprentice to a humble painter in the town of Perugia. This man possessed no extraordinary talent, but he held the art of painting in the highest veneration, and delighted in boasting to his pupil of the wealth and fame to be gained by it when properly exercised. 'Tis true he did not speak from personal experience, for he was miserably poor; but this he imputed to his not being one of fortune's favourites. His words produced a visible effect on the mind of the young Piètro, who listened with sparkling eye and glowing cheek.

'And I too,' he would exclaim, interrupting his master, while his face lighted up with hope and enthusiasm—'I will be a great painter! I will gain fortune and fame!'

If he met with any one who had travelled, his first question was, 'In what country are the best artists to be found?'

This question he also frequently put to his master, who always replied, 'In Florence; for there men are excited to exertion by three things—poverty, criticism, and the insatiable thirst for perfection which that celebrated city inspires.'

Piètro Vanucci, whom we shall henceforth call Perugino (a name which he afterwards took at Peronte, on being honoured with the freedom of that city), hastened to Florence to breathe the atmosphere which he conceived to be impregnated with art, and capable of inspiring and exalting its lowliest votary. But at what a price was he compelled to purchase this inspiration! When he arrived at Florence, he possessed nothing—absolutely and literally *nothing*; his clothes hung on him in rags, and for several months his bed was an empty chest with a little straw! During this time he suffered all the tortures of hunger, and every kind of misery. But what matter! he had the will to succeed—that persevering and powerful will which overcomes all difficulties, and which the Creator has bestowed on man, to be exercised for his own good and that of his fellow-creatures.

Perugino laboured incessantly day and night: painting was his only occupation, his only pleasure. Before him stalked continually the hideous phantoms—want and misery; and to escape them, he flew to his palette and his pencil: then a more pleasing picture smiled on him—that of prosperity and fame, which, in anticipation, he already enjoyed; and to secure the realisation of which, he braved fatigue, cold, and hunger. His favourite maxim was, that cloudy weather must sooner or later be succeeded by sunshine, and during the bright days of summer, a shelter should be provided against the inclemency of winter. Courage and exertion like his deserved to succeed; and they did so. In a few years he became known as a young artist of uncommon merit; his paintings were to be met with not only in Florence and throughout Italy, but in France, Spain, and almost every other country of Europe, making the fortune of those who bought and sold them as well as his own.

Perugino painted for the nuns of a convent in Italy a 'Dead Christ,' the colouring of which was exquisitely beautiful; and the landscape forming the background of the picture was much admired, though this particular feature in painting was not, in his time, brought to the state of perfection which it has since attained. The nuns were offered for this picture three times

the sum they had given for it, with an exact copy by the hand of Perugino himself; but they refused to part with it on any terms, as the artist owned to them that it might not be easy for him to produce another of equal beauty.

At another convent in Florence he painted the 'Nativity with the Magi' on the walls of the cloister, an undertaking in which he succeeded to admiration; and prompted by feelings of gratitude towards one of his masters, Andrea Del Verocchio, he introduced his head among those of the wise men that formed part of the picture. It was a common practice among the artists of Perugino's time to testify their respect for their masters by introducing their likenesses into what they considered their best paintings; and Perugino himself afterwards received an immortalising mark of gratitude of this kind from the divine Raphael, who, in one of his finest paintings, that of 'The School of Athens,' represented himself near Perugino in the character of his pupil.

The prior for whom Perugino painted the 'Nativity' was particularly clever in preparing the beautiful blue called ultramarine; and as he possessed a large quantity of it, he wished it to be used in every painting done for his convent; but being naturally of a suspicious temper, and fearful of losing even the smallest particle of it, he required that Perugino should use it in his presence only. The artist was hurt and offended at this ungenerous treatment, and determined to find a way of revenging himself, and conveying a lesson to his suspicious employer. Whenever he required the ultramarine, the prior, who stood over him like a sentinel, drew some from a little bag which he carried about his person, and put it into a phial, from which he never turned his eyes as long as Perugino was using it; but as soon as the artist had applied one or two touches to the wall on which he was painting, he dipped his brush into a goblet of water that stood near him, and more of the precious colour sank to the bottom of the glass than was used in the work. The prior seeing his bag emptied without much advantage to the painting, clasped his hands as he gazed at it, exclaiming from time to time in a tone of horror, 'Oh what an awful quantity of ultramarine does that limestone wall soak in!'

'You see with your own eyes,' replied Perugino coldly. But the prior had no sooner left the room, than the painter drained off the water, and removed the powder which had sunk to the bottom of the goblet, laying it carefully aside.

At length, when he thought he had sufficiently tantalised the prior, he went to him, carrying with him the precious colour, supposed to have been absorbed by the limestone wall.

'Here, father,' said he, presenting it to him, 'this belongs to you, and I restore it to you. You see how easily I could cheat you were I inclined to do so. Let this teach you to give all men credit for honesty, until you have had reason to doubt them; for to treat a man as a rogue, is sometimes to make him one.'

Unhappily, Perugino himself, as he advanced in years, became a slave to the very vices which he despised so much in others—avarice and suspicion. Having amassed considerable wealth by his paintings, which were executed in different parts of Italy, he returned to Perouse, where he was loaded with honours; but these did not satisfy him. Money was his idol, and to obtain it and keep it seemed the grand business of his life. Even his most intimate friends were looked on with an eye of suspicion whenever his darling money was in question; and to such a length did he carry this unhappy failing, that he became, in his old age, the subject of scornful jests and epigrams. On one occasion, going from Perouse to Citta-Della-Piève, and carrying with him a large sum of money, which he could not prevail on himself to leave behind in safe keeping, he was waylaid and attacked by robbers, who stripped him of his treasure, leaving him half-dead with fright and chagrin for the loss of his money. This misfortune had such an effect on his

health and spirits, that he took to his bed, and refused all consolation. Although he was in possession of extensive property in houses, lands, and money, he set no bounds to his sorrow for the loss he had sustained; till at length his friends and numerous admirers, becoming alarmed for his life, took pity on him, and between them, made good the sum of which he had been robbed. The cause of uneasiness removed, Perugino soon recovered his health, and resumed his occupations; but avarice had taken entire possession of him; and to gratify his longings after gain, he was guilty of acts of meanness that admit of no palliation.

He who had once so ardently panted after fame, now sacrificed it for the sordid purpose of heaping up gold. His paintings were hurried over, and copied by his own hand for sale, to increase his gains.

We will not, however, longer dwell on the defects or infirmities of Perugino's old age, but cast the veil of pity over the close of his life, in consideration of the hardships and difficulties that marked its commencement. His history has furnished us with more than one good lesson: it has added another proof to the many already existing, that persevering industry is usually crowned with success; it has shown us that the very blessings we most eagerly desire may, through our own perversity, become scourges and torments; and lastly, it teaches us a lesson of deep humility, for while we read Perugino's reproof to the prior, we cannot but remember the warning, 'Let him that thinketh he standeth take heed lest he fall.'

Perugino ranked high in his day both as a painter and an architect. What distinguished him particularly as a painter, was the grace of his heads, especially those of children and women; and his perspective in landscape was thought equal, if not superior, to that of any of his predecessors. In the Louvre at Paris are still to be seen five of Perugino's paintings; and Italy possesses many *chefs-d'œuvre* by this artist, though a number of his works have been spoiled or degraded. He died at the place of his birth, Citta-Della-Piève, A.D. 1524, and his remains were consigned to the grave with the honours due to his genius.

MANUFACTURE OF INDIAN-RUBBER SHOES.

The man of the house returned from the forest about noon, bringing in nearly two gallons of milk, which he had been engaged since daylight in collecting from one hundred and twenty trees that had been tapped upon the previous morning. This quantity of milk he said would suffice for ten pairs of shoes, and when he himself attended to the trees, he could collect the same quantity every morning for several months. In making the shoes, two girls were the artists, in a little thatched hut which had no opening but the door. From an inverted water-jar, the bottom of which had been broken out for the purpose, issued a column of dense white smoke, from the burning of a species of palm-nut, and which so filled the hut, that we could scarcely see the inmates. The lasts used were of wood, exported from the United States, and were smeared with clay, to prevent adhesion. In the leg of each was a long stick, serving as a handle. The last was dipped into the milk, and immediately held over the smoke, which, without much discolouring, dried the surface at once. It was then re-dipped, and the process was repeated a dozen times, until the shoe was of sufficient thickness, care being taken to give a greater number of coatings to the bottom. The whole operation, from the smearing of the last to placing the finished shoe in the sun, required less than five minutes. The shoe was now of a slightly more yellowish hue than the liquid milk, but in the course of a few hours it became of a reddish-brown. After an exposure of twenty-four hours, it is figured as we see upon the imported shoes. This is done by the girls with small sticks of hard wood, or the needle-like spines of some of the palms. Stamping has been tried, but without success. The shoe is now cut from the last, and is ready for sale, bringing a price of from ten to twelve vintens or cents per pair. It is a long time before they assume the black hue. Brought to the city, they are assorted, the best being laid aside for exportation as shoes, the others as waste rubber. — *Edwards's Voyage up the Amazon.*

TRANSLATION OF THE GERMAN STUDENTS' SONG. 'GAUDEAMUS IGITUR.'

SUNG AT THE STUDENTS' FUNERALS.

LET us then be merry, boys, while our youth protects us;
After youth so bright and cheery—
After age's season dreary—
Still the earth expects us.
Where are those who walked the world in the days before us?
To the realms above us go—
Seek the gloomy shades below—
Mystery still is o'er us.
Quickly fled the past of life—quickly fades the present;
Death strides quickly through the land,
Strikes us with unsparing hand,
Spare nor peer nor peasant!
Live the university! live the grave professors!
Live each don of look sedate!
Live each undergraduate!
Free from all oppressors!
Here's a health to every maid famed for wit and beauty!
Here's to every wedded dame,
Every one of spotless fame,
True to home and duty!
Here's unto our native land, and to those who sway it!
Here's to all who spend their gold
As Mæcenas did of old,
And on art outlay it!
Perish all that cast a shade o'er our mirth and gladness!
Perish all the devil's wiles!
Every foe to youthful smiles!
Every form of sadness!

C. R.

SCOTTISH FAMINE SIXTY YEARS AGO.

A partial famine took place in Scotland in 1782, and 'the spring and summer of 1783 proved wet and stormy, and the prospect of the next winter was still more gloomy. The pressure now became extreme; government was applied to for a loan, on the security of assessments to be imposed upon the land; and Mr Dempster, then one of the most active and influential of the Scotch members, brought in a bill for an assessment of fourteen per cent. on rents. Government also made a small grant, which was intrusted to the sheriffs of counties for distribution among the kirk-sessions. Subscriptions were raised in the south of Scotland and in England; many Scotchmen, merchants in London and elsewhere, sent shiploads of provisions for the supply of the poor. Among these the house of Phyn and Ellice was conspicuous. The concluding of a general peace in 1783 set at liberty the stores collected for the navy, and these were placed at the disposal of the sheriffs, but only to be sold. Government also purchased provisions, and sent them down for sale at prime cost. Among other supplies, large quantities of bad white peas were sent down to the north, which were unpalatable even in that time of famine. The rule was, to give as little as possible; but what was sold by the kirk-sessions was to a great extent on credit. The harvest was as bad as was anticipated; in many instances the people ate their stock of sheep and cattle, which in the winter it became impossible to feed. In some Highland parishes the population broke loose, and seized the cattle and sheep of their neighbours; but the instances of this were very few. In general, the patience of the people was great, and every one exerted himself in his own sphere to meet the evil. Their efforts were so far successful. All accounts agree in stating that not an individual died of absolute want during the long-continued famine, though many fell victims to the diseases which spring from insufficient food, or food of bad quality. The clergy record with just pride the efforts made by all classes, and the honesty of the people in repaying the advances of meal or money to the uttermost farthing. Some with difficulty could do this in seven or eight years, but the accounts agree that not a penny of the money but was paid at length. We know instances where gentlemen advanced meal and seed-corn to their poorer hill tenantry; and not only was this all repaid, but for years afterwards, the tenants used to send presents of honey, mountain-berries, and other trifles in token of their gratitude.' — *Quarterly Review for March.*

'THE OLD ALMANAC.'

THE torrent of great events which has broken over Europe this spring, forcibly calls attention to a branch of literature which we have been accustomed to hold in some degree of credit, on account of its presumed instructive character, but which has of late years been occasionally spoken of in a different strain—that is to say, as little better than an old almanac. One cannot but ask if history is really a useful branch of knowledge, when we find that it did not serve to prepare governments for the late revolutions, nor even to give the public the least premonition of their coming. History, one would imagine, ought to be in public affairs what experience is to private individuals—the guide to the sequence of events, showing what effects are sure to flow from certain causes, and thus enabling statesmen to avoid wrong, and choose right courses. Yet no one can say that history ever appears to act in this way, or indeed to be anything else than a communicator of mere information as to the things of the past—in some places dry, in others romantic and entertaining, but never a lamp to the feet of living nations.

It is unfortunate, but true. One reason palpably is, that it is difficult, out of the great mass of events produced by the contending passions, the ignorance and the knowledge of men, to eliminate maxims as to cause and effect. Corresponding with the jumble of the past, there is a jumble of the present, causing men to attribute the events of history to very different causes, according as their prejudices and general cast of mind may direct: thus some will think the civil war a consequence of the obstinacy and bad faith of the king, while others attribute it wholly to the restless zeal of the puritanic party; so that to each man this whole affair tells a different story, and leaves a different conclusion; and a similar crisis might occur next year without our being in the least enlightened beforehand as to the best way of treating it, or acting under it, by what took place in the seventeenth century. Our written histories, and even the daily comments of our newspapers, take accordingly two, if not more sets of views of everything that has ever happened, or is in the way of happening; one representing all progress as a direct source of good, while another sets it down as an evil, only made so far harmless by the good sense of those who hold to the old ways. In such circumstances, how is it to be wondered at that no possessor of power appears to know whether he may safely resign a part of it, with a view of retaining the remainder, or whether it is not safer for him to take his chance with an absolute resistance to all change?

Another stultifying cause is of a more radical nature—namely, that the world is always making a certain, however slow progress from inferior to better

ideas, as well as feelings: its tendency at any one time is to act on superior considerations to what animated it at any preceding period; this being a result of that growth of civilisation which arises from other causes. History is thus thrown into the awkward predicament of being a teacher of that which is superior to itself. It reports the doings of savagery to the days of chivalry, and the deeds of chivalry to the times of peaceful industry. It exhibits the evils of superstition to those who have long learned to smile at superstition, and it prates of the maxims of narrow class selfishnesses to those who have attained the dignity of thinking that that only is good which is good for all. Thus it may warn—it may warn against the things that would lead to retrogression—an almost superfluous task, as far as appears; but it is ill qualified to guide or instruct in the onward path which most nations pursue. It is to be feared that, with the lamp thus hung up behind, nations are only confused by their own onward-thrown shadows, instead of being benefited by the light. There is such a thing as a love of history for the gratification it gives to taste as a branch of literature, and the charm which it exercises over those feelings by which we are linked to the past. Many are in this way made worshippers of ideas far below the standard of the age in which they live, giving up for a fancy or whim the study of those principles on which the progress of the nation is based. Thus are many men in a manner lost to the community, which otherwise might be benefited by their talents and their aspirations.

Even although we could look at history without prejudice, and although it were less describable as a blind leader of those who see a little better, there would remain one grand obstruction to our benefiting greatly from its narrations. Taking it as it is written, the mass is too huge to be read by all. We would require to have any instruction which it contains drawn off, and essentialised down into some compact principles which could be readily comprehended. But who is to execute this task, or how is it to be executed? We could not move one step until we had a just and universally-admitted view of the natural history of the human mind, showing what it is from which history (the acts of men) immediately proceeds. Is it an aerial conglomeration of unintelligible caprices, or is it a thing acting under certain laws, which render its procedure in any degree a subject of calculation? We should also require to have arrived at some distinct understanding as to that unseen government under which human beings live and act. Is it conducted according to rule—that is, by a sequence of regular effects from certain causes—or is all done after the arbitrary dictates of an impenetrable will? The generality of men act upon the understanding that there is a natural order of things, by virtue of which evaporation is attended by an ab-

straction of heat, irritation follows insult, and honesty is the best policy: they see it in their own limited affairs; but when a revolution takes place in a state, or the convictions of a great body of people experience a change for the better, they lose sight of the connection of cause and effect. They therefore read the grander and more instructive passages of history as they would read a fairy tale or a Greek tragedy; never dreaming that, if these things are exempt from a natural order, they can give forth no lesson whatever as to the determination of future affairs. Now, as for a just system of mental philosophy, and a correct view of the Divine government of the world, they will come when things are ripe to produce them; but while they do not exist, we do not see that much good can be derived from history. Any good that is derived must be empirical and uncertain, and we cannot expect it to operate extensively for the benefit of mankind.

For these reasons, it seems to us that history, notwithstanding all the brilliant names connected with it, is only a series of chronicles. It is curious and interesting in many parts, as merely telling us of what has been done in such and such times and spots of earth. Some noble and affecting passages are scattered over it. It often pleases a high taste, as pictures do. But as a view of what human beings are, perform, and suffer in certain circumstances, or as a guide to them in future contingencies—being only a field for the contention of prejudices, not a temple for the exhibition of ascertained principles—it is nearly altogether useless. A man may be an ill-informed man who is wholly unacquainted with it; but those who have studied it most thoroughly, will be not a whit more advanced in philosophy, or better fitted to address themselves to new crises, if such should occur. We readily admit, however, that, even as information, it is desirable, and it should have a place in the liberal knowledge of every man who aspires to be something more than a mere doer of drudgery, or a medium between one generation and another.

Perhaps, as in the case of meteorology, which, not being yet a science, has nevertheless a number of axioms resting on common observation, so there may be in history, pending its arrival at a philosophical character, some dicta of sufficiently obvious truthfulness to entitle them to notice. For instance, there is always this disadvantage attending a new government, which has come into existence by the victory of one system over another, that it has to take strong measures for its own preservation. With the best intentions, therefore, as to liberty, it may be forced into being a very arbitrary and even tyrannical force. An old government, with not so good intentions, may be milder and more endurable, by reason of its being in such security that it can act easily and good-naturedly. This is perhaps the explanation of what caused Madame Roland's dying sentence—'Oh, Liberty, what deeds are done in thy name!' It is one of the considerations which might give pause to extreme men, if extreme men could see aught but their own ideas. On the other hand, it may be held as tolerably well settled by experience, that governments and institutions are generally their own most dangerous enemies, and that their destruction usually partakes much of the character of suicide. Mankind are, after all, not difficult to govern. Most of them are too much engrossed by their own affairs, to be much disposed to rigid criticism on state matters, so that these are only conducted with a decent regard to the general interest. It therefore is a strong presumption against any political system, that it is the subject of violent discontent. And it must depend on its own good sense whether, having established such a difficulty, it is to get over it or not. Real good intention towards the many will relieve it, while dogged egotism will of course be apt to prove its ruin. Another observation is, that when a government is too much centralised, and the people having everything done for them by paid functionaries, the popular faculties are liable to be benumbed,

for want of exercise in things a little beyond their common range, and the state loses genuine strength accordingly. It seems to be not less certain that countries having a common government ought to be ethnologically one; that is to say, certain natural affinities (affinities being at the basis of sympathies) are required of the people living under one political system, in order that it may be a well-working system. If a union has taken place, it must have been brought about in such circumstances as to preserve for each member of the partnership entire self-respect, otherwise, certainly, that member will never cease to be a source of annoyance to its associate. In these and a few other deductions from plain and oft-recurring facts, there is scarcely an approach made to philosophy, but they nevertheless have a certain paper-currency value, as representing gold which remains in the cellars of the bank. They represent, it is to be feared, all the wisdom that is as yet to be had from 'the Old Almanac.'

THE RUNAWAY SHIP.

A SALT YARN.

ONE afternoon watch, two seamen were seated face to face astride the fore-topmast cross-trees of a large Indian homeward-bound, which had all her canvas, standing-sails included, spread to the south-east trade-wind that slants upward from the Cape towards the equator. The breeze was freshening, and the sails which, about noon, were murmuring and rustling, now slept full: everything drew, as the wind had been hauled a little on the ship's starboard quarter; her head lying about west-by-north, and she going about eight knots through the water; just bending now and then enough to give the lee yardarms a pleasant slope to port, and over the blue surface, which already looked darker and brisker, with little tops of white in our shadow to windward. With the privilege of a watch below, I was lying over the top-sail-yard, in the bunt by the mast, my feet upon the foot-rope, and a spyglass in my hand, through which I took an occasional glance at a vessel on the horizon, supposed to be a frigate. It was so hot and close in my berth on the half-deck, that this employment was no small luxury, joined to that of seeing others kept at work, feeling the air out of the foot of the top-gallant-sail, and looking down into the water, where the shape of every fish that came near the surface was clearly defined in a greenish light, and the coveys of glittering flying-fish sprang ever and anon like swallows from one wave to another in the distance. The white decks stretched below, with the boys knotting their yarns on the forecastle, the sailmaker at his canvas in the waist, and the quarterdeck out of sight, where the first and second mates were busy getting the mizen backstays set up. Before me lay half the ocean-circle, beautifully azure-tinted, where a long line of white clouds were gathered, in contrast to the clear region of the breeze astern. Up above my head shot the white swell of top-gallant, royal, and sky-sails, the former of which half concealed me from the two sailors, although their legs dangled from the cross-trees over my back, while its shadow secured them from the hot sun. One was passing the ball of spun-yarn for his companion, who was twisting it with his sewing-mallet round the shrouds of the royal-mast, which had been pretty well chafed bare by seven months' work and weather. The easy conversation with which this task was beguiled, found a ready cavesdropper in me, since it smacked of the brine, and was in no respect checked by the neighbourhood of a youngster from the other watch. In the present case it fell insensibly to a yarn, which I took care to log as correctly as possible soon after; a yarn in the daytime only happening in such a sequestered situation as this, and being more valuable from its unpremeditated nature.

'Hold on there with the ball, Bob,' said the one parenthetically, and at intervals; 'and give us a dip of the tar. Now pass away, and take the turn out o' that

yarn. Well ye see, bo', he continued, 'Jim Taylor an' me—you knows Jim?—that voy'ge we'd been having a good cruise ashore after the South-Sea trip, and the shot-lockers was beginnin' to turn rather low; but still, as we'd seen so much together, we made it up to go chum for another spell. I'd two or three offers of a berth myself, but short trips wouldn't go down with me at no time, after I knocked off apprentice: there's somethin' low an' humbuggin' about 'em, to my taste, as keeps a man neither green nor blue, neither seein' life nor the world, an' tarnation ready to get sick over a yard; so I've managed to keep a midship helm atwixt the two tacks of a coaster and a man-o'-war's-man. Jim, too, he was rather down in the mouth about a love consarn, so we stuck together like a pair o' purchase-blocks bowed chock on end. Every forenoon we stands round Liv'pool Docks in company, under easy sail, twiggung all the craft, as you may suppose, an' overhaulin' the good an' bad points on 'em, like a couple of bo'suns. Berths at that time was plenty, and hands scarce; so it was the more hard to please Jim an' I. We wanted to see some'ere as we hadn't seen afore, with a smart craft under us, a reg'lar true-blue for skipper, good living, and a fok'le full of jolly dogs. We spells out all the tickets in the rigging of the passage-craft, with the port, and time of sailing; and says Jim, just as I was stepping on the gangway plank, "Hold on, Harry, bo', let's go round the China berth first." And says I, at sight o' their heavy poops, an' Dutch bows, and tumble-home top-sides; all reg'lar-going and holystone, "None o' yer loo'ardly tea-canister affairs for me. Don't ye twig that there lubberly splice in the fore-rigging?" Again we'd fancy Badoes, or Lima, or Rio, or Valparaiso; but speakin' truth, my notion was for some sort of out-o'-the-way-come-venture or another, where we'd see life once in a while, and turn to again on the sober tack. So all said an' done, we fought shy of an offer: as the "old man" hauled close on us, we squared away, tops our boom, an' was off with a touch of our tarpanlins, an' "I doesn't think as how I'm a goin' for to ship this voy'ge, yer honour," for which we got curses enough to split the main-taups'l, ye know.

How's ever, one forenoon watch, as we was both backing and filling alongside of the Queen's Dock, full of bluff-bowed Danish timberers, Norway logs the colour of rosin, and yer wall-sided, kettle-bottomed American cotton-wagons, I seed as fine a barque-rigged craft as I ever clapped eyes upon moored out in the middle to a Swedish brig. She was clipper-cut about the bows; level bowsprit in a line with her run; a long sheer, but plenty of beam before the waist; high topsides, black out, but painted yellow within, and a yellow streak on her. Her sticks had a bit of a rake st, with short lower-masts, and the yards black; but such a pair o' slapping tall topmasts as she had, I never see in a craft of her size: an' I could see with half an eye, though both lower an' taups'l yards was cock-billed up an' down dock-fashion, they'd the weather-arm of any ship in the dock. "That chap's Boston-built, Jim," says I, "for five guineas—reg'lar go-ahead, seed no mistake. Why, she'll spread near half the cloths in her main-taups'l of a twenty-eight sloop-o'-war!" "My eyes!" says Jim, with a shiver like, "how she'd dive into a head sea though! She'd cut through the comb of a Cape swell afore it 'ad time to rise." "That's neither here nor there," I says: "but I'd like to know the ropes o' what she's after: I've a notion it's some'at of a taut bowline. She wants a third of bein' down to her bearings, though they're clearing for out a'ready, ye see." Accordin'ly, Jim an' me uses the freedom to sheer round, and step over two or three other craft, to get a near look at the Yankee. Her mate was roaring like a young bull to a hand aloft that was sendin' up to-gallant and royal-yards; and, "Well," says I to Jim, "it's clear they doesn't savvy sendin' up a gallant-yard here, like they did in the old Pacific. Twig the lubber: he's taken the line wrong side o' that backstay. Be look out; here goes!" I makes one spring into her

rigging, up to the fore-top, bears off the yard, flats the tackle, and clears it, and had the spar rigged out in no time. Down I comed to the rail by a topmast backstay, but no sooner nor the ill-looking customer of a mate opened on me with his jaw.

"Who told you to shove your car in?" says he, "you tarnation British 'loper! I guess you want to book yourself pretty slick; but you don't enter this voy'ge, so be off!" "Axes your parding, sir," says I, winking to my chum; "an' hopes no offence, sir; but I thou't ye wanted a lift that time. You doesn't begrudge a poor fellow's flippers a little tar, sir, after fisting the blankets so long ashore?" "Top yer boom in the twinkling of a handspike," says he; "that's all I've got to say to ye." "Ay, ay, sir," says I, though I hung in the wind notwithstanding; for that moment I twigs a big-beamed fellow come aboard astarn of him, as I took to be the skipper—a hook-nose gentleman, clean-shaved, an' black i' the jaw, with two fists like leading-blocks, an' rigged out in a long-togged coat three cloths under his size; but he didn't look afeared on a gale o' wind.

"Well, Mr Fisher," says he, overhaulin' me all the time out of his weather-eye, "be so good as get them two new taups'ls out o' the half-deck, and bend them. You don't seem but a smartish hand," says he to me when the mate was gone aft—"you don't, my lad, for British growed. Been 'down east,' I reckon, now?" "Yes, sir," says I; "I sailed onst with the Garrick liner, out an' home." "Thought so," says he. "Well, now, if I was short-handed, I don't know but I might a shipped you this trip." "No harm done, sir," says I.

'Well, ye see, Bob, the short yarn of it was, the Yankee skipper ships us both, at eighteen dollars a month, bound to Noo Orlaing, with a cargo of what they called "notions." The barque's name was the "Declaration," Eikabode Tappan, master: we didn't know till after she'd only eight of a crew before the mast when we fell aboard of him. 'Fact, we heard from an old shipmate next day, as Ike Tappan, they called him, was well known in the Gibraltar waters for a sharp hand, that knew precious little of lunars, an' never was heard on with a full-manned ship; she was 'tarnally runnin' away with 'em, and missing her port, like one o' "God's ships," as they used to christen the Yankees. Never an underwriter of 'em all would insure the Declaration; but bein' one o' the owners himself, an' always somehow fallin' on his feet, no man overhauled the craft. "She's a slap-up boat," says Jim to me; "an' he's a prime seaman, I understand; but I'll bet next voy'ge, Ike Tappan's arter some'at new, an' apicy to the bargain. I never knowed her Liverpool-away afore."

'Well, Bob, a night or two after, as we was going into the Hothouse Tavern, as they calls that big skylight affair by the docks, who does we meet comin' out but our new skipper, yard-arm with a long-togged shore-goin' chap, as I fancied, under a false rig, and steerin' shy. Hard-a-port it was, and we sights the two down street, bein' a blowy night, making stiff tacks for the door of a Jew sloop-shop to wind'ard. "Somethin's i' the wind, Jim," says I, "sure enough." The next day we goes down to hoist our dunnage aboard, where we finds no un but the shipkeeper, and a Boston boy washin' decks, until the skipper hi'self come up the companion, with one we took for a new hand, in a red shirt, canvas togs, and a sou'-wester on his head for all the world like a Lunnun dustman's. "My eye, Harry," says Jim, "twig the green; mark them hands o' his. That fellow's sarved his time with ould Noah, I'm thinking, an' slept the watches ever since." "Well, I'm blessed," says I, "if that aint the same chap he had in tows last night, an' rigged out a cloth over strong to begin with."

"Now, my man," says the skipper to him, "tarn to aloft, and tar down them lifts an' backstays." "Ay, ay, sir," says he, quite ready like, though I wish you see what a long face he pulled at first dip into the tar can. A smart, knowing-like chap he was, though he

put his feet into the ratlines like a post-boy, an' went up a bit at a time, smearin' all in his way, instead of from the mast-head out, till of a sudden smash comes the can on deck out o' the maintop, without, "Stand from under." The whible forenoon, I do b'lieve, if the skipper didn't keep that poor devil going aloft, out on the yards, an' gettin' the ropes by heart, in a drizzle of rain, and after every one else was gone. I couldn't make it out at all, until we hears the day after, just afore haulin' through the dockway at flood, as how there was a reg'lar bobbyery kickin' up about docks: a dozen out-bound craft boarded by p'lice and gov'ment officers, all about some quill-driving don that had cut his stick with a sight o' money. As soon as I caught the hand in the red shirt lookin' over his shoulder, I smoked the rig in a moment, an' says the skipper, "You, Smith, up to the fore-taups'l yard, an' overhaul the gear." There was only Jim an' me, and the two mates, an' some dock-wallipers on deck, hard tailing on to the warp-ropes, an' a couple o' ship's boys aloft; the other hands came out in a boat as we dropped down. Just as we sheers round into the river, there was a large New York steamer, paddles backed and 'escape-pipe roaring, and full of passengers, as was being searched from stem to stern, where they found the gentleman's traps aboard sure enough, without hisself. Nor no sooner was we abeam of her, but a boat pulls alongside, and three officers jumps up the gangway.

"Got any passengers aboard, captain?" says they. "Not as long as my name's Eikabode Tappan," says he; "'taint a payin' consarn, I expect." "Look sharp aloft there, and loose that fore-taups'l," sings out the skipper; and I couldn't help grinning when I squints up, an' sees the chap with the red shirt bent over the yard, aver havin' to hail, "Ay, ay, sir," as gruff as a bo'sun. "Bear a hand there, ye lubber; overhaul the reef-tackles an' chuelins—d'ye hear? Forrud there, sheet home fore-taups'l." "Must look into your cabins, sir," says the officers. "Well, if it's law," says the skipper. "I can't go ag'in it; but a fair wind can't wait, you know, gents," says he, "an' I shouldn't like to break my rule ag'in passengers. I reckon we're gettin' a good deal o' way upon her." By the time they come on deck again, we had the two taups'ls, fores'l, and spanker set upon her, and I was at the wheel, the hands aboard rigging out the jib-boom; and, "Well," thinks I, as they got down the side to pull back, "if it had been but a frigate's reefer instead, he'd have hauled on a different rope, Captain Tappan." How's'ever, we soon caught a good wind; and by the way the windmills along the heights went whirling round, we expected a staggering breeze past the Point. How she did take it, too, on them two slapping taups'ls o' hers, the moment she got the full weather, blue out o' the Irish Channel, with a smart swell! Hard work it was grinding her wheel down; but she came to in a twinkling, ready to fly into it. I saw how it 'ud be at worst: with that spread of canvas, and them heavy spars, with the hands we had, in a gale and on a wind, we'd no more be able to reef or hand the two taups'ls or courses nor as many school-boys. How's'ever, we was scarce well out from the land, when somethin' more came on our look-out; surging over it with a flash up the bows, all hands busy gettin' ship-shape, I hears the skipper sing out to his black stoo'ard below, to hand him up the glass. There was a telegraph goin' upon the headland, which the drift on it couldn't be seen, until the smoke of a large steamer was sighted to win'ward, through the haze, headin' for us from up Channel.

"Well," says the old man, "what's this? I ain't"—"She's double-funnelled," puts in the grumpy mate, lookin' through the glass—"a steam-frigate, I calculate." "No!" says the captain; "you don't—whew—ew!" And he gives a long whistle, seein' as just at that moment comes out a gleam behind one o' the big Channel swells, then the sound of a heavy gun. "That's a long un," says the mate. "Clap on the jib,

there," sings out Captain Tappan. "Set the gaff-taups'l and royals, Mr Fisher," says he; "and keep her up a point, lad," to me. Away we cracks, with the craft on her best foot, balling off eleven knots pleasantly. We had the heels of the steamer; but if that wasn't enough, what does we see her do shortly, but stand across the New-Yorker's course, to overhaul her the second turn. By the second doz-watch, it bein' late season and soon dark, we'd lost sight of 'em both. Our Yankee skipper's fashion was to close-reef all afore turning in, man-o'-war style, if the weather was fickle in narrow waters, otherways there was no keeping the craft in hand: it took all on us to one yard at a turn, so ye may fancy what it would a' been in a blow! All the next day, havin' stood well to the east'ard, we sees nought o' the smoke-flag, "Admiral Jones's pennant," as we used to call it in the old Pacific; so cracks on everything that would draw till morning, when it fell a pretty dead calm, with a swell off the mouth of the British Channel. About four bells i' the arternoon we sees our queer customer from the fok'le come 'pon deck out o' the cabin, in a pilot-coat: all at onst the fellow hails the skipper through the skylight, and there, sure enough, was a smoke to west'ard of us, just over the smooth o' the water-line, when we rolled. By five bells you could see the two funnels quite plain, the steamer seemin'ly havin' cruized the two days to win'ward of our course, for an airin' to her hands, an' then comed back to pick us up. The captain looks at his chap, an' then at the steamer. "Yes," says he, taking the cigar out of his teeth, "that's considerable nasty, I expect?" An' I did feel for the other fellow from his looks. "Well," says the skipper, "there's a cloud brewin' to win'ward though. We'll have it hot an' heavy from the nor'west directly. Lay aloft there, all hands, to reef taups'ls?" And he takes the wheel from the hand aft. "Close reef," he sings out, as soon as we'd got hold on the earrings. The yards was braced round, and the swell rose in no time: the cloud was all round the weather-side in a quarter of an hour, as black-blue as you please, and the red sun goin' down through it, till the tops of the heavy swells was as red as blood. It was quite dark in that quarter, when we hears the thud, thud o' the steamer's paddles, and her engine clanking, an' over out o' the cloud she comes as black as night, right upon the comb of a sea; and all in a moment it was white foam, pouring down the water-side, and her full jib and gaff'sls jibing as she went round. Up we went above her, looking on to her deck over the smoke; the men at stations, and a gun ran out to loo'ard. "Port, port," sings out our skipper, "keep full." The steamer's pipe roared like thunder, and she kept givin' a stroke now an' then; the captain and a lieutenant stood up on the paddle-box, holding on by a rail.

"What barque's that?" screams out the captain through his speakin'-trumpet; and afore there was time to hail—"Round to, and keep under my quarter till the squall's over—her Majesty's ship Salamander." "Daresn't do it, captain," sings out the skipper. "I'll dismast you then, by —!" The wind took us just then on the top of a sea, main-taups'l swung full, and away we went, with no time to rise on the swell, shippin' a tremendous horsehead, that washed every one off his feet holding on. Our last sight of the steam-frigate, she was plungin' off one green comb to another, half her length, out against the light, and her weather-flipper whirling round, feelin' for the water, an' the next minute buried up to the grating in a foam. She'd her wrong side to us, or I don't doubt she'd ha' let drive off the top o' the wave with that infernal long eighteen.

When the Declaration rose again, how's'ever, it was pitch dark; nothin' to be seen but the foam gleaming, and a white line 'twixt sky an' sea to win'ward, or the binnacle lamp in-board. It took two of us at the wheel, hard up an' hard down, to hold her; runnin' as straight suth'ard as might be, under nothin' but spanker,

close taupe's, and foretopmast-stays'; wind blowing strong abeam, and a blast o' rain. About three bells morning watch the weather cleared a little, with a break to starward. All of a sudden the look-out on the foreyard hails out, "Light, ho! two lights hard on the lee-bow." And the captain goes aloft to overhaul them. Down he comes—"Cape You-shan't right ahead, Mr Fisher," says he: "we'll never weather it under this canvas, an' can't go about neither. Up there! shake out reefs! swig up taupe's-halyards!" says he. An' up goes the high cloth against the scud to loo'ard, till we made out the two lights from the wheel, drawin' end on, low down betwixt the swells as she pitched aloft. "Split them two lights," says he to the wheel, "or we're ashore in an hour. Press her well up, my lads," says he; "loose away the mains' there." "She'll never bear it," says the mate. "Don't know the Declaration yet, Mr Fisher, I guess," says he. "Board maintack there, ride him down with a will, men. Haul aft the sheet." Well how she pitched, an' drove right under, shippin' green sea over the weather-chains! She hove a fellow over the wheel without, "By your leave," an' the maintack surged like a capstan-fall, every strand with a purchase on it. "It's blowing harder," says the mate. "Half an hour, and we're off," says the skipper. But sure enough, by that time we was reeling through—down head and up again, like a Dutchman's cow—first a howl through the rigging, and then a calm in the trough, things lookin' black for the masts of her. "Ease off the maintack," sings out the skipper; "an' stand by to brail up and furl." Ticklish work it was to do as much as the first; but hand the sail we couldn't, with the captain and his passenger at the wheel to free all hands; so out in the brails we let it blow, like a fisherman's bladders, an' got up to reef taupe's coaster-fashion. As soon as the halyards was let go, chualains an' reef-tackles chock up, the sail drove into the lee-rigging, jammed through the shrouds, every square a bag o' wind; ship careening right down to loo'ard; the yard like to alide us off, if it didn't shake us; an' not a hand on deck to touch a rope. We couldn't compass it nohow; an' the mate sings out to the wheel to luff a little, and shake the sail. "Furl it!" roars out the captain, giving her a weather-spoke or two; an' sartintly we did get up the head-leeches of the sail, and the gaskets passed round one yard-arm, when up slap comes the foot of it in the blast, with a noise like thunder, hammering our heads an' blindin' us till the whole was free again. Not having her jib neither, she was just breaching to with that bit of a luff, when the fo'taupe's saved her: snap went the martingale-stay as it was, and she carried away her jib-boom in the first pitch. The skipper filled away in a moment, grinding the helm hard up, and singin' out to us to leave the sail, an' sheet it half home again; so off she stood, squaring yards before the wind, easing off sheets, flying over it with a roll. We couldn't take another stitch off her; an' if I ever seed a craft runnin' away with her masters, that was it. Hows'ever, the mornin' was broke, and straight down the Bay of Biscay for the two mortal watches we goes, before the stiffest nor'-easter I remember, without lying to. She made easier weather, the skipper al'ays said, on a drive as with a helm lashed. At night I didn't like the looks of it noway; the sea was gettin' tremendous; the wind pinned ye to the rigging; and as cowl'd as a man could stand, though 'twas as dry as oakum, 'cept for the spray.

"Them sticks wot stand it, cap'en," says the mate, lookin' aloft like a stargazer, an' as gloomy as the bowsprit end. "You don't know them sticks, Mr Fisher," says the skipper. "I may say I raised 'em and smoked 'em myself. They're as tough as whalebone. They'll stand it, if the cloth don't." "True enough, sir," says the mate; an' a little after, just as she rose out of a lull, away doesn't the fo'taupe's! go, with such a crack, out o' the bolt-rope, clean away to loo'ard, like a puff of smoke. "Set the mainstays'!" sings out the skipper, "and keep her up a bit, my lad."

'I think I sees that passenger-fellow's face by the mizen-rigging, as he held on like death, and the barque hung over the black surge, up an' down, like looking for her shadow in the troughs, and climbing the hill for fear on it, shipping the grim seas in her waist as she came up. Blessed if he didn't show the white rag that time! an' I thou't myself as he'd done somethin' bad. The men said he looked like a chap woud ha' been glad of the gallows; and one swore his next trick at the helm to luff up into a sea, an' lend a hand to sweep clear of him. Hows'ever, by the mornin' watch our wind was laid a bit, an' we driving as bare as we could to sou'-west, main-taupe's-lyard still half down to the cap, with the sail set. The craft took it better nor ever I seed a craft do with the same sea on; but the mate said we'd run three degrees out of our course. By eight bells noon, what does the captain do but call all hands aft, to say as she'd never lie her course, he was goin' to bear up and run due south, a three months' trip for Monte Video. "I expect," says he, "to make somethin' of it thereaway, an' a sight better market. So, my lads," says he, "if you'll ship, an' no words, why I'll make it two dollars a-head warmer by the month." Every one looks at his neighbour, and grins as he walks forrard, seein' as it was no use to growl, if we'd wanted. For one, I'd ha' been ready cheer ship. "Mr Fisher," says the skipper, "square away the yards, and swig up that maintaupe's-lyard. Down maintack, too; I see the wind's moderatin' pretty fast. Full an' by, my man," says he to the wheel; so away we cracked on her, with a starn sea running, for the Canaries.

'Long yarn, Bob, if I told you the rig our skipper played with the blockhead* at Monte Video, an' them lubberly Brazil cruisers. All I've got to say now is, as it's hard on eight bells, my chum an' I heerd, on gettin' back to Liverpool a couple o' year after, as how that there chase of ours from the steam-frigate warn't about the passenger at all, but a consarn of our sharp-sailin' skipper's, as only an Admiralty clerk could take the turns out on. I never knowed the rights on it; but I don't doubt he kept clear o' both the Channel and Boston for a good spell.'

'Well, mate,' said Bob, as he passed the ball for the last time, 'give us the other yarn in the first watch.' Whether Harry did so or not, I, belonging to the larboard watch, had no opportunity of hearing it.

HISTORY OF A SOD.

'Always examine what other men reject as worthless.'

We may perhaps be thought jesting when we affirm that the history of a sod of grass is one of great interest; and we are content to refer to what follows for our justification, as we state our serious conviction, that the reflections to which a little clump of green turf give rise, are replete with instruction of no mean order. The sod before us, and the pen in hand, we must proceed methodically to our investigation—investigate it historically, botanically, and chemically. Observing this order, we may first inquire how the sod took origin. If we examine its structure, we shall find that it is a thick and consistent mass of roots, which, by their countless entanglements, have enclosed a quantity of the soil beneath in such a manner that it is scarcely to be separated from them. This structure enables us to remove the sod wholly from the surface of the place upon which it is found. How, then, was the foundation, so to speak, of this mass of vegetable fibres and mould laid? If our sod was cut from the stony bosom of a rock, the answer lies far back in ages gone by. A tiny lichen began the work there; and after serving its purpose in coating the naked and desolate surface with a thin layer of vegetable mould, it was at length vanquished by a stronger than itself in the form of a waving, clustering moss. The winds and tempests of years tried the courage of the moss, and many times threatened its utter destruction; but it still

* Blockade.

held firm. The lichen which preceded it had roughened the hard surface, and the clasping fibres of the moss laid hold of the smallest inequalities. The rain descended, and the winds blew; but neither conquered; for the moss flourished, and had a thriving family, which being rapidly joined by vagrant relations and friends, the rock began to look green. This was the first robe. By and by the birds of a distant region found rest on the rock, and left behind them the undigested grains of herbs plucked and devoured many miles away. Of these, some lived, some remained dead. Of the living ones, eventually only a few survived, for some were too delicately appetised to exist on the thin face of their new cradle, and became rapidly choked by those sturdy rustics who were content with a draught of rain (containing a fraction of ammonia), and with such a minute amount of alkalis as was left by the mosses and lichens in their decaying remains. A wiry vegetation was now busy in constructing the foundation of the future sod. Little rootlets, tough as cords, and pushing themselves in every direction, bound together the loose and incoherent mass of decaying tissues, sand, and degraded soil, which the previous occupants had left behind them. The rock itself suffers change. Water and carbonic acid attack it, and it slowly crumbles. The plants now formed help the work; they appropriate its ingredients; the depth of soil increases. It has also become richer; consequently a better class of plants can live thereon. Now the hardy-constituted wiry grass either dies of too much food, or is choked in retribution by the descendants of those which it formerly killed. The soft green blades of fragrant grasses come up, and paint the once gray and dreary landscape in the most refreshing colours. Year succeeds to year; the winter kills some; the spring awakens others; and the summer ripens the seeds of a multitude of grasses which the autumn shakes to the earth, and by its heavy rains, causes to take root in the soil. Layer after layer of roots overtops the last. All traces of the early mosses are lost in the brown humus at the bottom, so that one could scarcely form even a conjecture as to how the work began.

But possibly our sod has been taken from a rich meadow, lying along the sides of a deep inland-penetrating stream, thick, rank, and luxurious, with crowding blades and towering stems. This green meadow was once a quiet lake, or perhaps a part of a more tumultuous sea. From those 'heaven-kissing hills' which form the rough, uneven outline of the horizon, and from which the stream takes origin, centuries have washed down tons upon tons of alluvial soil. The waters of the lake grew shallow, aquatic plants fringed its edges, and assisted the process. The waters sank, the land rose. No sooner did it appear above the surface, than, as if with wings, the seeds of numberless grasses and other plants flew thither, and rapidly colonised the spot. But though the surface looked quickly green, much time must elapse before the due thickness of a sod is formed. Many a contest also will take place between sturdy docks, and noisome weeds, and the sweet-leaved grass, before the latter gains the entire supremacy; and in fact this it never absolutely succeeds in effecting without aid from man. In a few years this work, too, is completed, and the surface over which in bygone times the ripple rolled, or the billow heaved, now rejoices in a waving garment of the freshest green.

So far for the pure history of the sod; now for its botany. Those who have never taken the pains to examine the herbage of a sod, will be disposed to believe all grass to be pretty much the same, if indeed a difference be admitted at all. We believe very few are really aware of the number and beauty of the species which may be, and often are, contained within an area to which a hat would form an ample tent. Mr Curtis, well known for his various works on natural history and botany, tried a curious experiment with the assistance of a friend. Sods of grass six inches only in diameter were cut from nine different places in Hampshire and Sussex, and were selected indiscriminately from the spots whence they were removed. They were then planted in Mr Curtis's

garden, where they thrived luxuriantly. On being examined, the following interesting discovery was made: One piece of sod from Selborne Common, six inches diameter, contained fourteen different species of grass; and, singular enough, a similar sod from Ringmer Down contained an equal number. Others bore respectively nine, seven, six, and five species—none contained fewer than three. Who has not inhaled with pleasure the sweet perfume of new hay! This perfume is due to the presence of the *Anthraxanthum odoratum* (sweet-scented vernal grass). Even the green leaves of this graceful grass readily impart this perfume to the fingers by which they are bruised. Another species somewhat like it in appearance is the fox-tail grass; but it is more coarse in foliage, and is destitute of the fragrant odour of the former. Another, and a more elegant species, is the well-known, almost ubiquitous, *Poa pratensis*, which springs up alike on our old walls and on the fostering bosom of our fertile pastures. Every one must have admired the beautifully fine hair-like grass which clothes the surface of our dry heaths, downs, and sheep-walks—a grass upon whose velvet-like surface the foot is seldom weary of resting. This grass is called the *Agrostis capillaris*, in evident allusion to its character; and being admirably constituted so as to endure heat and drought, it furnishes a valuable food to the mountain-fed sheep, that would otherwise be altogether destitute at such seasons, or could feed only in the sheltered valleys of these regions. Another grass equally adapted for a peculiar situation, and almost certain to be found in our lamp of sod, if it was taken from the hard bosom of a northern limestone rock, is called the *blue dog's-tail* grass; and for such situations as it is found in it is well adapted, from its at all times affording sheep a tolerably fair pasture. Beside these, there are probably in our sod the curious, inconstant, yet common grass called rye-grass, or *Lolium perenne*, of the most vigorous growth, and in rich meadows greedily consumed by cattle. Mr Curtis says that this grass appears to vary *ad infinitum* even in its wild state: he had seen a variety of it with double flowers, and one with awns, both of which are very uncommon. In some pastures, such as are not very moist, the stalks are sometimes viviparous towards autumn; sometimes it produces scarcely any stem, and much foliage; at others, little foliage, and an abundance of flowering stems. It is a curious fact, that if we examine this same sod, having returned it again to the earth, in the next year, or in the year following, we shall in all probability find that an entire change of species has taken place. Some that are now luxuriant will then have degenerated, and some that are now weak will then have become entirely removed from the army of green blades. Why is this? It is found that if the grasses are kept close shaven to the ground, or are fed down, to use the agricultural phrase, this deterioration is avoided; whereas it is almost sure to follow if the herb is allowed to run to seed. It is a sort of natural rotation. Changes in the soil very probably take place which are favourable to the other varieties, but detrimental, or less favourable to these; and the natural consequence is, that the healthiest wins the field.

Let us lay the grass stem under the knife. On removing its leaves from the glistening surface of the stem, they will be found attached at their base to a joint, which they also partly embrace. What are these joints? Passing the knife through the stem, it is found that it has this striking difference from other plants: it is a hollow tube, and at each joint a sort of diaphragm or cross partition is stretched so as to divide the stem into a number of closed cylinders, each having no connection whatever with the one above or below. This is exactly the structure of a bamboo. It is on this account that a great botanist has declared that our tiny inhabitants of the sod, which we have been wont to despise and trample under foot, belong to a noble family, which, under favouring influences of sun and warmth, carry their heads near ten times higher in the heavens than we ourselves—these are the bamboos. In his own words—the words of Nees Von Esenbeck—

grasses are but dwarf bamboos. The microscope only can reveal the true beauty and structure of the minute flowers which adorn the lowly grasses. Thus examined, they present a pleasing and interesting study. Every one must have seen the curious little spikelets of the bromes, or meadow grasses; and the attentive eye will have marked here and there a yellow stamen peeping out of its unattractive flower. The microscope, or a good lens, reveals the fact, that every spikelet is made up of many flowers beautifully arranged together, as if they were the coverings of one which does not appear. Each little flower consists of a couple of tiny scales, supporting the hairs or bristles with which we are so familiar. These little scales—technically, *paleæ*—cover two other smaller scales, which appear to be the rudimentary calyx or corolla of the flower; and these, with the others, enclose and shelter the stamens and ovary. With the structure of the seed we do not think it necessary to deal. Suffice it to add, that in the counsels of a watchful Providence, it has been so ordained that that rapidity of growth which is essential to the speedy covering of the earth with her green mantle, has been both foreseen and beautifully provided for in its fabrication.

We may consider that two chemical processes meet in our sod—the one belonging to the chemistry of life, the other to that of decay and death. To take the last first. If the roots of the sod are carefully examined, it will not be difficult to separate the living from the dead; and the latter class includes the decaying and decayed. The brown, friable, pulverulent matter which is called mould, and composes a considerable portion of the underground mass of the sod, is vegetable fibre having undergone its complete decay. Chemists call it *humus*. It is insoluble, or nearly so, in water; it cannot, therefore, although rich in carbon, contribute any of that element directly to the thick vegetation flourishing above. Yet it was long considered that this very humus was the real and only origin of the wood of plants. As, however, plants can only receive soluble particles by their roots, and those of humus are insoluble, it is a very simple and just conclusion to arrive at, that the source of carbon in vegetation lies not for the most part in the soil. The thin air and the viewless winds will better answer the question. Is the humus of the sod, then, altogether useless? Not so. It is the reservoir of all the alkaline and mineral ingredients of the last generation of plants, and these are absolutely essential to the wellbeing, even to the existence, of vegetation. In the undisturbed greensward, allowed to lie for years by the grazier, this stock of salts amounts to a large quantity; and if the plough is now sent through it, the smiling sod torn up, broken, and crushed and sown for wheat, a crop of vast luxuriance follows. But this only lasts for a year or two, and the land returns to its former average, or possibly falls under, for reasons not to be here entered into. In the upper layers of the sod, vegetable fibre in the actual process of decay is sure to be found. It may be recognised by its crumbling character and brown colour. Possibly it consists of the slain bodies of the grasses which were felled by the last winter's frosts. Water and air are busy here; the work of destruction hastens on; the woody fibres undergo 'eremecausis,' to use the Liebigian phrase—that is, they are slowly, or by degrees consumed. In so doing, they are continually evolving small portions of carbonic acid gas; the fibres become more and more broken up; until at length it is not possible to distinguish them from the pulverulent humus above-mentioned. In this process all the salts and mineral constituents which entered into the composition of the original fibres are again surrendered to the soil in their turn, to enter into new relations, and to serve new purposes in the physiological economy of another generation. The carbonic acid gas eliminated in decay is not produced in vain. When the rootlets of the young grasses are feeble, while the growing stem and leaves draw much upon them, the genial rain descending dissolves this gas, and supplies it to the spongioles of the roots in a liquid form, to be then carried up into the vegetable system, and there decomposed. So far for the chemistry of death in the sod. How little do we prize the purifying in-

fluence of our green fields! How little value the myriads of minute laboratories in the greensward, which, busy all the day long, drink up the detrimental carbonic acid gas of our empsoned air, and pour out in return, volume for volume, invisible fountains of purest oxygen! Such, humble as they are, is their high vocation, so far as it directly relates to man. That fatal gas which he and his manufactures, and his humbler relatives in the zoological scheme—animals, birds, and the almost invisible insect—alike combine to produce, the cheerful sward feeds upon, gladly appropriates, makes into wood, turns into leaves and stems, and, more useful still, converts into health-sustaining food for man and beast. During the shades of night the grass lands, in common with the rest of vegetation, evolve carbonic acid; but it has been satisfactorily demonstrated that the preponderance is incomparably in favour of the oxygen evolution during the day.

We have spoken of the tender blades which crown our sod as forming food. The chemical analysis effected by Sir H. Davy shows that the following principles in the grasses are those by the possession of which it is adapted for this end. Their remarkable simplicity will not fail to be observed: mucilage, sugar, bitter extractive matter, a substance analogous to albumen, and various saline ingredients. Let this suffice for the history of a sod. The desire has been to exhibit, however imperfectly, the rich and varied amount of interest and instruction which may be made to flow out of the contemplation of one of the commonest objects in nature.

ADVENTURES OF AN AUTHOR OF THE LAST CENTURY.

AUTHORSHIP is not so ancient a profession in this country as it is usually considered. Before the beginning of the last century there were hardly any mere authors—that is, persons who lived by literature as a trade. Writers did something else as well as write, if it was only to fetch and carry for their patrons; and except in a few rare instances, books were made in the pauses of the real business of the world, or else manufactured to the order of those who could afford to say, with a later flatterer of the muses, 'We keeps a poet.' An author was part of the train of the aristocracy: he could do nothing without patronage, for the 'reading public' was not yet fairly born; and the consequence was a general servility and toadyism—an acknowledgment of inferiority—which influenced the destinies of literary men long after the cause had ceased to exist.

But patronage was not an evil in itself—it was an indispensable step in the progress of literature. Patrons enabled authors to write, and in some measure compelled the public to read; and as the taste for letters spread more widely, they themselves, having fulfilled their mission, retired gradually before the new power they had invoked. Although patrons, however, cannot coexist with a reading public, the habit of servility survived their withdrawal; and even in our own day, there have been seen specimens of the dedicational fulsomeness which was fashionable at the time when the dedication made the fortune of the book. Such, however, are rare exceptions; and generally speaking, authors, placed as they are on a more equitable and prosperous footing, exhibit in their manner the badge of their independence.

And this occurred occasionally, too, in an earlier day than ours—even in that transition period when patrons were only retiring, and the public only advancing, and when authors hardly knew which way to look, behind or before. 'The notice,' wrote Johnson to Lord Chesterfield, 'which you have been pleased to take of my labours, had it been early, had been kind: but it has been delayed till I am indifferent, and cannot enjoy it;

till I am solitary, and cannot impart it; till I am known, and do not want it. I hope it is no very cynical asperity not to confess obligations where no benefit has been received; or to be unwilling that the public should consider me as owing that to a patron which Providence has enabled me to do for myself.' Not long before this, the high-hearted author had been arrested for £5, 18s.; and not long after, he was obliged to give up, as too expensive, his lodgings in Gough Square, where he had but a single chair for the accommodation of his visitors, balancing himself in the meanwhile on another with three legs and one arm.

Among the authors of this trying period, although it was fertile in enduring names, none is regarded with more interest at the present day than Oliver Goldsmith. He may be said to be the very opposite of Johnson, not only in character, but even in style—and yet the men were friends; for the 'inspired idiot' and the 'great Cham of literature' were connected by a fine thread of humanity, over which the antagonisms of manner and position had no power. 'Oliver Goldsmith,' says John Forster,* 'must be held to have succeeded in nothing that the world would have had him succeed in. He was intended for a clergyman, and was rejected when he applied for orders; he practised as a physician, and never made what would have paid for a degree. The world did not ask him to write, but he wrote, and paid the penalty. His existence was a continued privation. The days were few in which he had resources for the night, or dared to look forward to the morrow. There was not any miserable want in the long and sordid catalogue, which in its turn and in all its bitterness he did not feel. The experience of those to whom he makes affecting reference in his "Animated Nature"—"people who die really of hunger, in common language, of a broken heart"—was his own. And when he succeeded at the last, success was but a feeble sunshine on a rapidly-approaching decay, which was to lead him, by its flickering and uncertain light, to an early grave.'

This is from the preface to a volume which we wish to recommend warmly to our readers, and but little the less warmly that we think Mr Forster does not discriminate nicely enough between the character of the author and that of the man, and that he thus suffers himself to be led occasionally into some injustice to the persons with whom his hero came in contact. But a generous enthusiasm of this kind is by no means characteristic of the time, and we are not sure that the world does not gain more by the feeling than it loses in the fact. At anyrate, a biography of Goldsmith could not have been worthily written by a cold heart or a tranquil brain; and of all the men we know, the best adapted for painting the lifelong struggles of this outcast child of nature and fortune is John Forster.

The life of Goldsmith has hitherto been but little known in its details, for it required a congenial mind to search out and recognise its materials, and fill up the spaces vacant of authentic record from the hinted facts and unconscious recollections of the subject himself. The narrative, however, is well worth some trouble, not only as conveying the personal history of a man of genius, but as serving to illustrate in a most interesting manner the important literary period we have described as that transition state between private and public patronage, which led to the establishment of authorship in this country as a distinct and now crowded profession. We shall take some pains, therefore, to follow Mr Forster in his narration; and we only regret that the space to which we are restricted will preclude our doing this so often as we could wish in his own language—a language always energetic, and not seldom elegant.

Oliver Goldsmith, born in 1728, was the son of a vil-

lage clergyman in Ireland. He was an ungainly boy: short, plain, awkward, heavy, yet of an affectionate and cheerful disposition. He entered Trinity College, Dublin, as a sizer—in other words, a menial; but after his father's death, he was only able to maintain even this miserable position by writing street ballads for his support, at the rate of five shillings each. At night, he used to steal out of the college to hear them sung. 'Happy night!' says his biographer, 'worth all the dreary days! Hidden by some dusky wall, or creeping within darkling shadows of the ill-lighted streets, watched and waited this poor neglected sizer for the only effort of his life which had not wholly failed. Few and dull, perhaps, the beggar's audience at first; more thronging, eager, and delighted when he shouted the newly-gotten ware. Cracked enough his ballad-singing tones, I daresay; but harsh, discordant, loud, or low, the sweetest music that this earth affords fell with them on the ear of Goldsmith. Gentle faces pleased, old men stopping by the way, young lads venturing a purchase with their last remaining farthing; why, here was a world in little, with its fame at the sizer's feet! "The greater world will be listening one day," perhaps he muttered, as he turned with a lighter heart to his dull home.'

He tried for a scholarship, but only succeeded in obtaining an exhibition—worth thirty shillings; and so elated was this wild Irish boy at the unaccustomed success, that he invited some of his companions to a dancing party at his rooms. The festivities were concluded by his tutor bursting in and knocking down the entertainer. Oliver, overwhelmed with the disgrace, ran away from college, but was brought back by his brother. When his college days were gone by, he became a private tutor for a time, but quarrelled with the family, and set off for Cork with £30 in his pocket, a good horse, and some vague plans about going to America. He returned home very soon, *minus* the money, and mounted on a Rosinante, for which he had given £1, 15s. Law was his next speculation. He started for London to keep his terms, with £50 advanced by his uncle; but he was intercepted by the *ill-luck* at Dublin, where he lost the whole at play. Medicine was then tried, and he actually spent eighteen months in Edinburgh as a student; but having become security for a comrade, he left the country, hunted by bailiffs, and proceeded to finish his studies at Leyden. Here he read, taught, borrowed, and gamed for a year, and then determined to pursue his travels farther. A friend lent him wherewith; but Oliver's *ill-luck* still pursued him. Chancing to see some rare and expensive flowers which his worthy uncle in Ireland had a passion for, he bought the roots without hesitation, and sent them off as a gift, leaving Leyden the next day with a flute, a guinea, and his last shirt on his back.

A sketch of his travels is supposed to be given in the history of the philosophic vagabond in the 'Vicar of Wakefield.' 'I had some knowledge of music,' says the vagabond, 'with a tolerable voice; I now turned what was once my amusement into a present means of subsistence. I passed among the harmless peasants of Flanders, and among such of the French as were poor enough to be very merry—for I ever found them sprightly in proportion to their wants. Whenever I approached a peasant's house towards nightfall, I played one of my most merry tunes, and that procured me not only a lodging, but subsistence for the next day. I once or twice attempted to play for people of fashion, but they always thought my performance odious, and never rewarded me even with a trifle.' 'In other words,' says Mr Forster, 'he begged;' but this is not the Irish interpretation. We once knew a professor of music in London who made it no secret that, when times were bad, he drew his hat over his brow, and took his flute out into the streets. This young Irishman would have scorned to beg, and he never even borrowed without blushing! 'My skill in music,' continues the vagabond, 'could avail me nothing in Italy, where every peasant was a better

* The Life and Adventures of Oliver Goldsmith. A Biography in Four Books. By John Forster of the Inner Temple, Barrister. Author of the 'Lives of Statesmen of the Commonwealth.' London: Bradbury and Evans. 1848.

musician than I; but by this time I had acquired another talent which answered my purpose as well, and this was a skill in disputation. In all the foreign universities and convents there are, upon certain days, philosophical theses maintained against every adventurous disputant; for which, if the champion opposes with any dexterity, he can claim a gratuity in money, a dinner, and a bed for one night. In this manner, then, I fought my way towards England; walked along from city to city; examined mankind more nearly; and if I may so express it, saw both sides of the picture. In due time he reached his destination, and in the middle of February 1757, he was wandering without friend or acquaintance, without the knowledge or comfort of even one kind face, in the lonely, terrible London streets.

This was the point to which he had been gravitating from infancy. London was his destiny; and what were his qualifications to meet it? What armour did he bring with him to the struggle? How was he to bespeak the sympathy, and enlist the good-will, of his fellow-wanderers in those cold, stony, interminable thoroughfares of mankind? How was he to elude the crafty, to oppose the bold, to flatter wealth, to propitiate power? In fine, what were his means of drawing subsistence from the wants, or whims, or weaknesses, or wickedness of men? Plain even to ugliness, insignificant in his figure, vulgar in his look and manner, his speech deformed by a provincial brogue, poorly clothed, without a shilling, without a friend, without a care, a fear, or a reflection, what was he to do in London? Steal, starve, or write. In vain he tried to live by his former employments. In vain he spread plasters for the poor, and taught dunces as the despised and ridiculed usher of a school. His fate found him in spite of all; and the philosophic vagabond, pursuing a routine which remains the usual curriculum of literature to this day, became a drudge of the London periodicals.

The time was unpropitious. Burke, a few years before this date, unable to comprehend the transition period in which it was his fortune to live, made it a subject of complaint to his Irish friends that genius, the 'rathe primrose which forsaken dies,' received no encouragement from the nobility, but was left to the capricious patronage of the public. Fielding was recently dead, poor and disappointed; Collins was about to follow, with the addition of madness to his lot; Smollett was engaged in that struggle for bread which was to terminate in a foreign grave; Johnson had just emerged from a sponging-house, to be fed by the booksellers with a single guinea at a time, because he would not work if he had two in his pocket. Richardson alone was successful; but then he was a printer as well as an author, and that made all the difference in the world.

Goldsmith was in his twenty-ninth year when he became an author by profession. He was employed upon the 'Monthly Review' in writing articles which he never acknowledged, as they were all 'tampered with by the proprietor Griffiths or his wife.' He had a small regular salary, with board and lodging; but in five months quarrelled with his employers, being accused by them of idleness, and retorting an accusation of insolence on the part of the man, and a denial of ordinary comforts on that of the woman. The accusation of idleness he met by stating that he worked from nine o'clock till two, and on special days still longer. He now took lodgings in a garret near Salisbury Square, and crept on for some time in obscurity, till his seclusion was suddenly invaded by his youngest brother Charles, who, fancying from the long silence of Oliver that he was getting on famously in the world, had made his way up to London to share in his good fortune. 'All in good time, my dear boy,' cried Oliver joyfully, to check the bitterness of despair. 'All in good time: I shall be richer by and by. Besides, you see, I am not in positive want. Addison, let me tell you, wrote his poem of the Campaign in a garret in the Haymarket, three storeys

high; and you see I am not come to that yet, for I have only got to the second storey.' He made Charles sit and answer questions about his Irish friends; but at this point the light is again withdrawn, and for some two months there is greater darkness than before.

He tried the ushership again; but came back—of course, poor moth!—to the candle whose devouring flame he was destined to feed; and by and by, in a letter to a friend, he mentions that he is 'in a garret, writing for bread, and expecting to be dunned for a milk score.' After this, thinking in desperation that he might possibly obtain an appointment if he could pass the examination at Surgeons' Hall for an hospital mate, it became an important problem how to obtain a suit of decent clothes. This he solved by writing four articles for the 'Monthly Review,' on condition of Griffiths becoming security to the tailor; and thus handsomely equipped, he presented himself at the Hall, and was found—not qualified. In four days after this, the clothes were sent to the pawnbroker, to discharge a debt due at his lodgings, his landlord having fallen into distress still more dire than his own; and before a week had passed, being in actual starvation, he placed the four books he had reviewed in the hands of an acquaintance as security for a trifling loan. Then instantly followed the demand for the books, and the price of the suit of clothes; and on learning the truth, Griffiths applied to the miserable author the names of 'sharper and villain.'

For this Griffiths, notwithstanding, he wrote subsequently a life of Voltaire, intended to be prefixed to a translation of the 'Henriade.' He received £20 for the service, from which he deducted the price of the suit of clothes; and on being visited soon after by Percy, the well-known collector of the 'Reliques,' he was found busy with another work, the 'Inquiry into the State of Polite Learning in Europe.' 'He was writing the Inquiry,' says the future Bishop of Dromore, 'in a miserable dirty-looking room, in which there was but one chair; and when, from civility, he resigned it to me, he was himself obliged to sit on the window. While we were conversing together, some one gently tapped at the door, and being desired to come in, a poor ragged little girl, of a very becoming demeanour, entered the room, and dropping a curtsy, said, "My mamma sends her compliments, and begs the favour of you to lend her a chamberpot full of coals."'

The book was at length published. 'Manifest throughout,' says Mr Forster, 'is one overruling feeling under various forms—the conviction that, in bad critics and sordid booksellers, learning has to contend with her most pernicious enemies.' The work made its way; and with the 'Bee,' and his contributions to other periodicals, he seemed to be getting on a little better. One chair and a window seat, however, were still the accommodations of his room; and on a particular occasion, an employer was known to call upon him, and after a noisy altercation, sit three hours till his literary arrears were made up upon the spot. We next find him uniting with Smollett in the 'British Magazine,' and afterwards contributing to the 'Public Ledger' a series of essays, reprinted in 1760 by Mr Newberry, with the well-known title of the 'Citizen of the World.' He now took more respectable lodgings, made the acquaintance—to ripen into the friendship—of Johnson, and wrote various small matters with industry and perseverance.

Goldsmith now made his appearance in society, and was accustomed to frequent the parlour of Davies the bookseller, the resort of many literary men. 'A frequent visitor was Goldsmith; his thick, short, clumsy figure, and his awkward, though genial manners, oddly contrasting with Dr Percy's precise, reserved, and stately. The high-bred and courtly Beauclerc might deign to saunter in. Often would be seen there the broad fat face of Foote, with wicked humour flashing from the eye; and sometimes the mild long face of Bennet Langton, filled with humanity and gentleness.

There had Goldsmith met a rarer visitor, the bland and gracious Reynolds, soon after his first introduction to him, a few months back, in Johnson's chambers; and there would even Warburton drive in his equipage "besprinkled with mitres," on some proud business of his own, after calling on Garrick in Southampton Street. His next step was the settlement in comfortable lodgings, where his board of £50 a-year was guaranteed by Newberry. Here he was visited by Hogarth, and became a member of the famous literary club established by Reynolds, admission into which was speedily considered a distinction by the greatest in the land.

But he was still in deep pecuniary straits, and all the deeper, perhaps, for the new company he kept. 'I received one morning,' Boswell represents Johnson to have said, 'a message from poor Goldsmith that he was in great distress, and as it was not in his power to come to me, begging that I would come to him as soon as possible. I sent him a guinea, and promised to come to him directly. I accordingly went as soon as I was dressed, and found that his landlady had arrested him for his rent, at which he was in a violent passion. I perceived that he had already changed my guinea, and had got a bottle of Madeira and a glass before him. I put the cork into the bottle, desired he would be calm, and began to talk to him of the means by which he might be extricated. He then told me that he had a novel ready for the press, which he produced to me. I looked into it, and saw its merit; told the landlady I should soon return; and having gone to a bookseller, sold it for sixty pounds. I brought Goldsmith the money, and he discharged his rent, not without rating his landlady in a high tone for having used him so ill.'

Soon after this adventure, was published the 'Traveller,' and the name of Oliver Goldsmith appeared for the first time on a title-page. A higher distinction still was the declaration of Johnson, that so fine a poem had not appeared since the days of Pope; and when the great lexicographer read it aloud in company, 'from the beginning to the end of it,' a sister of Reynolds said that she should never more think Goldsmith ugly. For this poem, which Charles Fox called one of the finest in the English language, it does not seem probable that he received more than twenty guineas. He was prevented by his own want of common sense from deriving a greater advantage than this; for on being told by the Earl of Northumberland that he was going to Ireland as lord-lieutenant, and would be glad to do the author of the Traveller a service, 'poor Goldy' could only reply that he had a brother there, a clergyman, who stood in need of help. 'Thus,' adds Hawkins, the teller of the anecdote, 'did this idiot in the affairs of the world trifle with his fortune, and put back the hand that was held out to assist him;' and Forster informs us that only a few days before the said idiot had borrowed fifteen shillings and sixpence from a friend.

Goldsmith's next attempt was to unite medicine with literature—to practise as a doctor; and out he came accordingly 'in purple silk small-clothes, a handsome scarlet roquelaure buttoned to his chin, and with all the additional importance derivable from a full dress, professional wig, a sword, and a gold-headed cane.' The clothes cost four and a half guineas, and the doctor was so mightily pleased with them, that in the course of six months he got three more suits of a similar kind out of the unfortunate tailor. Nor is this indulgence to be wondered at, since the fact of wearing such a garb deprived him of all his customary enjoyments. No more tea at the White Conduit—no more ale at the club at Islington—no more nights at the Wrekin or St Giles's! Goldsmith was now a professional man, and must behave himself genteelly.

The 'Vicar of Wakefield' now appeared, the identical novel which, through the agency of Johnson, had some time before released its author from the hands of the bailiffs. 'Every one,' says Forster, 'is familiar with the Vicar of Wakefield. We read it in youth and in age. We return to it, as Walter Scott has said, again

and again; "and we bless the memory of an author who contrives so well to reconcile us to human nature." . . . Simple to very baldness are the materials employed. But he threw into the midst of them his own nature; his actual experience; the suffering, discipline, and sweet emotion of his chequered life; and so made them a lesson and a delight to all men.' Creating no stir at first, admiration gathered slowly but steadily around it; edition after edition appeared, and it was translated into several continental languages. Herder read it aloud to Goethe; and Goethe, 'some seventeen years ago, standing, at the age of eighty-one, on the very brink of the grave, told a friend that, in the decisive moment of mental development, the Vicar of Wakefield had formed his education, and that he had lately, with unabated delight, "read the charming book again from beginning to end."'

His next original effort was the 'Good-Natured Man,' which, on the first night of its appearance, was barely saved from condemnation, poor Goldsmith looking on with inexpressible dismay. He supped, however, in company, sang his favourite song, and was very noisy; but 'all the while,' said he afterwards, 'I was suffering horrid tortures; and verily believe, that if I had put a bit into my mouth, it would have strangled me on the spot, I was so excessively ill; but I made more noise than usual to cover all that, and so they never perceived my not eating, nor, I believe, at all imagined to themselves the anguish of my heart. But when all were gone, except Johnson here, I burst out a-crying, and even swore by — that I would never write again.' By this comedy he made £500, which, with his usual thoughtlessness, he laid out upon the purchase and furniture of chambers, and so involved himself in difficulties which he never surmounted. In these lodgings he seems to have lived with the most reckless extravagance; and he had other draughts upon his purse besides of another kind. 'He had two or three poor authors always on his list, besides "several widows and poor housekeepers;" and when he had no money to give the latter, he seldom failed to send them away with shirts or old clothes, sometimes with the whole contents of his breakfast-table, saying with a smile of satisfaction after they were gone, "Now let me only suppose I have ate a much heartier breakfast than usual, and I'm nothing out of pocket." His last guinea, exclaims Cooke, after relating some stories of this kind, was the boundary of his munificence.'

It is strange that the life of a poet and romancer should be graced by no love passage! The only thing in the volume even tending that way is the following account of two young ladies, the daughters of Captain Horneck. 'The eldest, Catherine, *Little Comedy*, as she was called, was already engaged to Henry William Bunbury, second son of a baronet of old family in Suffolk, whose elder son Charles had lately succeeded to the title, who is still remembered as *Geoffrey Gambado*, and as one of the cleverest amateur artists and social caricaturists of his day. The youngest, Mary, had no declared lover till a year after Goldsmith's death, nor was married till three years after that engagement to Colonel Gwyn; but already she had the loving nickname of the *Jessamy Bride*, and exerted strange fascination over Goldsmith. Heaven knows what impossible dreams may at times have visited the awkward unattractive man of letters! But whether at any time aspiring to other regard than his genius and simplicity might claim, at least for these the sisters heartily liked him; and perhaps the happiest hours of the later years of his life were passed in their society. Burke, who was their guardian, tenderly remembered in his premature old age the delight they had given him from their childhood; their social as well as personal charms are uniformly spoken of by all; and when Hazlitt met the younger sister in Northote's painting-room some twenty years ago (she survived *Little Comedy* upwards of forty years, and died little more than seven years since!), she was still talking of her favourite Dr Goldsmith, with recollection and affec-

tion unabated by time. Still, too, she was beautiful; beautiful even in years. The graces had triumphed over age. "I could almost fancy the shade of Goldsmith in the room," says Hazlitt, "looking round with complacency."

Goldsmith was now working at his various compilations; and in a letter to his brother, he notifies his appointment as 'professor of ancient history in a royal academy of painting,' which, in his situation, he remarks is something like ruffles to one who wants a shirt. Yet, with his usual generosity, he gives up to his needy relatives a legacy of L.15. The 'Deserted Village' was now published, and its success was instant and decisive. Many light miscellaneous works came after, with which the author replenished his purse for the theatres, Ranelagh, and Vauxhall, where he strutted about gaily dressed, and with a bag wig and sword. 'She Stoops to Conquer' followed, and met with prodigious success; and then 'Retaliation'—the last flash of his genius.

His debts were increasing, no longer by shillings and pence, but by hundreds, till they amounted at last, it is said, to L.2000; and as their burden waxed, Goldsmith sunk. He had neither the fortitude to reduce his expenses, nor the nerve to complain to his friends; and he 'bitterly felt a reproach,' his biographer tells us, which Johnson gave him at their last interview, in sending away, as a reproof, a whole second course untouched. He was attacked by a local disorder to which he was subject. 'It was neglect,' says Davies, 'which now brought it on. It was continual vexation of mind, arising from his involved circumstances; and death, I really believe, was welcome to a man of his great sensibility.' His worst symptom was want of sleep, and it was feared that this of itself might prove fatal. 'Is your mind at ease?' said Dr Turton, suddenly bethinking himself of the pregnant question. 'No, it is not,' was the reply—the last words of Goldsmith. He died on the 4th of April 1774, having then lived five months beyond his forty-fifth year.

We have now touched lightly upon the leading points in the character and career of one of the most delightful of English authors, and have left ourselves no room to follow his biographer in what may be called, after the title of a work of Goldsmith himself, his survey of the state of literature in England, or in the vivid sketches he has introduced from time to time of distinguished contemporaries. But we cannot conclude without adverting once more (for we have already hinted at the subject in the beginning of this article) at the one defect of the volume—its practically confounding the character of the author and the man, and using, however unintentionally, the colours of poetry in rendering weakness amiable and error attractive. It is obviously a mistake to attribute the misfortunes of Goldsmith to the peculiar condition of the literary profession in his time. A career of the most brilliant success would have made him neither happier nor wiser. Through the inherent recklessness of his nature (as strongly marked in the boy ballad-rhymer as in the poet, novelist, and essayist), he would have wanted in the midst of all-wasted luxuries that had become as necessary as bread; and dying, instead of a debt of L.2000, he would have left behind him a debt of L.20,000. His impulses, indeed, were all amiable, but they were governed by no sense of right; and he would thus without scruple commit injustice in order to obtain the means of being generous.

To pity Goldsmith for his poverty is throwing sympathy away. He was happier in his humble pleasures (for he was never too poor for pleasure) than when strutting in a laced coat with Sir Joshua through a masquerade. It may be doubted whether his most abject distresses produced a greater amount of pain than falls to the lot of higher-minded men in passing through the world. The reason why he took the buffets of fortune with a good grace was, that he felt them lightly; and even in his saddest and loneliest moments, he perhaps never had any experience, or even

conception, of the depth of despondency into which a proud and manly nature may be plunged by the casualties of life.

But his miseries, of comparatively little moment to himself, were a great gain to the world. In no other author do we read better practical lessons in the philosophy of poverty; in no other moralist do we find the acerbities of life sweetened by so gentle and kindly a spirit. But this is a part of the scheme of Providence. Without pain, there could be no pleasure; without adversity, no fortitude; without weariness, no hope. Even the most inspiring strains of the muse are suggested by oppression; for wretched men

'Are cradled into poetry by wrong,
And learn in suffering what they teach in song.'

OCTOBER IN ITALY.

THE great heat which prevails in Italy during the summer months, offers little inducement to the traveller to leave the shelter of the city, or the refreshing breezes of the sea-coast. In the rural districts, during that period, the mid-day sun is intolerable. The peasant quits his occupation in the field; the cattle are brought up from the meadow; and the birds of the air are silent, and seek the shade. Hardly a breath of air is abroad to stir the silvery leaves of the olive; and not a sound strikes the ear save the chirrup of the grasshopper, or the croak of some uncomfortable frog in the adjacent pond. The 'quick-eyed lizard' is basking in the sun, and the butterfly is abroad, and the painted dragon-fly; but all else is stillness and sultry repose—nature is taking her nap. Towards the evening, however, things appear to wake up again. All the world is alive, and out of doors. The water-carriers assemble at the well; the peasant girls are strolling through the valley, or over the neighbouring hills; the bat comes forth to enjoy its noiseless flight in the rosy twilight; and as night—balmy night—approaches, myriads of fire-flies people the olive grove, or sport about with their tiny lamps amongst the tall ripe corn.

Towards the latter part of the month of June we made an excursion into the interior of Tuscany, to visit a small village or hamlet about twenty-five miles from Leghorn, called the Baths of Casciana. These baths are situate in a sort of basin in the midst of several small hills, whose features in many places bear indications of considerable volcanic action. The waters are natural hot springs, strongly impregnated with iron; and during the summer months they are resorted to by invalids from various parts, on account of their restorative properties. Our visit was not so much for any benefit we anticipated from the waters, as for the pleasure we promised ourselves in the society of some good friends, who had taken up their quarters there for a short time. During our stay, we visited several parts of the surrounding country; and in one of our evening excursions, we extended our ride as far as a small village or walled town crowning the summit of a hill, and commanding on all sides a most extensive view of the country. The air was pure and salubrious, and the situation delightful. The vine was flourishing on all sides, giving promise of an abundant vintage; and the locality altogether was so charming, that we resolved, if all were well, to pass the month of October there.

In Italy, October is the most beautiful month in the year. The days are brilliant and warm, without being oppressive, and the evenings are cool and exhilarating. It is the favourite month with the Italians, who frequently spend this delightful season at their country villas, or at some rural retreat in the midst of the 'vendemmia,' or vintage.

With this object in view, we ourselves revisited the spot above referred to; and having an introductory line to one of the priests of the place, on one bright afternoon at the close of September, we alighted from our 'calessio' (or country gig), and proceeded to introduce ourselves at his villa. On entering, we encountered

two formidable dogs, which seriously threatened to dispute our passage; but a word from their courteous master soon recalled them to a sense of propriety, and after a little growling, and a precautionary sniff or two at our persons, they permitted us quietly to proceed. Conducting us over the villa, our host expatiated much upon its advantages, and the beauty of its situation. The interior arrangements partook of the usual uniform character of Italian houses, where everything is contrived so as to resist the heat, but where the frequent prevalence of a keen searching wind appears to have been entirely lost sight of. Passing through the antechamber at the entrance, we arrived at a large *salle à manger*, having long windows opening into a balcony. This apartment occupied the centre of the building; and on either side were doors leading to the sleeping-chambers, a library, and a refectory. The walls and ceilings were gaily decorated in fresco, and the floors were of polished red tiles. Throwing open the windows, the priest led us on to a spacious balcony, overlooking an extensive valley, highly cultivated, and rich in all the variegated tints of autumn. Here he pointed out to us the several objects within the range of our vision. There lay the fertile plain of Pisa, with its white city clearly defined in the afternoon's sun; to the left lay the sea; to the right we had the beautiful valley of the Arno, famous for the Tuscan straw; the lake Bientina, Pontedéra, Volterra, and all the numerous white villages thickly scattered over the face of the country. In the distance were the magnificent Apennines, with their snowy peaks, extending from the kingdom of Genoa, and round beyond Florence, to the confines of the grand duchy.

On the following morning we walked out to see the neighbourhood, and the little town which was within a few minutes walk of the villa. Entering by one of its antique gates, we passed through the market-place; and by a considerable ascent of steps we reached the chancellor's court, which at one time appears to have been a citadel, but is now used as a prison. The courtyard was very ancient, and decorated with numerous armorial bearings and crests of antique shape and fashion, recalling to our minds those dark, but in many respects brilliant, middle ages, when the disputes of rival factions compelled the people to seek security within walled towns. Such interesting relics of ancient feud are numerous in Tuscany.

Leaving the town, we accompanied the priest over a considerable portion of his property, which extended in one direction for several miles. The country about was undulating, or a series of deep valleys, intersected by ridges of high ground, the latter being pretty well covered with the olive, whilst along the warm slopes and valleys the vine was planted on terraces, and supported by canes, or hung in gay festoons from poplars on the more even ground. Quitting the road, we struck out into by-paths, and over the fields; spoke to the vine-dressers; looked in at cottages, and talked to rosy-faced children; and returning through the valley, we gathered several clusters of blooming fruit from the over-burdened vines on either side of our way.

It is said that in Italy there is no shade; and certainly a person coming direct from England must be struck with the scarcity and poverty of the trees in most parts of the country. Generally speaking, they are not much larger than our garden fruit-trees; although in some of the valleys and defiles, and by the mountain streams, the walnut and sweet chestnut are magnificent. Many of the trees, too, are of the ever-green class, such as the ilex, the olive, the cypress, and yew, with several others; and these, contrasted with the crimson leaves of the cherry, and the richly-variegated tints of the chestnut, give a charming variety to the landscape.

The peasantry of Tuscany and Lucca are excellent farmers, and the admirable system of terrace-cultivation of the olive and vine bears sufficient evidence of their industry and skill. They appear also to make the most

of their ground. 'Pergolas,' or vine-covered walks, are very general; and where they cannot train the vine, they plant the olive and fig-tree; whilst the low and damp grounds are occupied by osiers and canes, which are both very useful in their domestic economy. The Tuscan farmer divides the produce of his land with the proprietor, who usually provides him with seeds and implements of husbandry. The latter are of very rude and primitive fashion; and although many attempts have been made to introduce modern English agricultural implements, there is considerable prejudice against them on the part of the country people, who look upon them as innovations, and seem to think that the wooden ploughs and clumsy harrows and carts of their forefathers are all that can be desired. The peasantry in our neighbourhood were a fine, healthy, and good-looking race, particularly some of the women, who came from the country round about on a market-day, or on a 'festa,' when of course we saw them to the best advantage, dressed in their bright colours and gay ribbons and ornaments; and with those large Tuscan hats shading faces rosy as a Ribston pippin, they looked the very picture of health and contentment. There is a natural politeness and dignity of manner about them which is very prepossessing, and they never pass you on the road without a 'Viva, signore!' or some similar mark of respect or acknowledgment. And after a long ramble over the country, we have often been glad to partake of the simple hospitality of the roadside cottage, receiving many a civility that sought no recompense.

Their habitations are generally pretty clean and neat; the chief apartment being a good kitchen, with the fireplace on a raised hearth, nearly three feet from the ground, and a large funnel-shaped chimney to carry off the smoke. We looked in at one poor man's cot, where the variety of occupancy reminded us much of an Irish dwelling. Three kids were frisking about among a lot of chubby-faced children; a couple of dogs were dozing in one corner; the cat lay stretched at full length in the sunshine; and a party of buxom hens were strutting about, quite at home with them all. The walls were adorned with strings of onions, gourds, and red pepper pods, together with extensive colonies of spiders. Milk was scarce, and what there was, was chiefly goats', so that the children knew little about it. The little folks used to get a piece of coarse barley bread for their supper, which was followed by a tumbler of red wine amongst them, and then they were packed off to bed soon after the fowls.

The feast of St Michael, or Michaelmas-day, is considered the first day of vintage in this part of the country; but of course the gathering depends much upon the state of the season and the condition of the grape. Like harvest in our own country, it is a season of great hilarity and enjoyment—every vehicle is in request, and all hands turn out to assist in securing the precious crop. The rude cart slowly takes its way along the valley and through the sun-chequered avenues of luxuriant vines, drawn by two of their fine cream-coloured oxen, so remarkable for their docility and sturdy patience. Each cart is furnished with a mash-tub, as large as it will carry, into which the clusters of grapes are thrown as they are taken from the vine. As we accompanied the cart, and listened to the song of the vintagers, we felt a little concerned to witness such wholesale destruction of fruit, as each blooming damsel came to deliver her basketful of large purple grapes, which were immediately consigned to the tub by the ruthless individual in charge of it. When it is full, the cart returns to the storehouse, where the fruit is mashed up with a wooden club adapted to the purpose (and not pressed with the feet, as in many parts of Italy), after which the whole is carried away in pails—liquor, stalks, and all—and thrown into large vats for the purpose of fermentation. This takes place in a few days, and sometimes in the course of a few hours, according to the state of the atmosphere, and the temperature of the place in which the operation is per-

formed. At such time a movement is perceptible in the liquor; the volume of the fluid increases, and it becomes turbid and oily. At the end of several days, these tumultuous motions subside; the mass falls; and the liquor becomes clearer, and of a red colour, caused by the reaction of the ardent spirit on the colouring matter contained in the pellicle of the grape. When the heat in the mass disappears, and all the phenomena of fermentation have subsided, the liquor is drawn off into casks, where, by a second insensible fermentation, the wine is clarified, and in a very short time becomes fit for use.

The vine appears to us one of the most extraordinary and wonderful productions of nature. Passing through the vineyards in the early part of the year, you see nothing but the dry and sapless plant, not unlike the strands of an old rope hanging from tree to tree. The wood appears so dead and withered, that, as the prophet says, 'It is unfit for any work, nor do men take a pin of it to hang a vessel thereon.' It is utterly valueless even for fuel. But pass we the same spot in the exuberant autumn, and we shall see that withered and apparently sapless branch, staggering and borne down with the weight of clusters of tempting fruit, bringing joy and contentment to thousands, to whom its generous liquor seems as indispensable as bread.

The other staple production of the country is the olive, from the fruit of which the oil is expressed by a very simple process. The berries are carefully gathered in baskets, and passed under a millstone; and when sufficiently bruised, the pulp is put into coarse hempen bags, and placed under a powerful press, from which the liquor runs down into a stone trough, and the oil is seen floating on the surface. This is removed by means of a shallow metal bowl, and poured into large wickered flasks, where it is allowed to stand some time, when the grosser portion of the oil falls, and the finer is poured off into fresh flasks; this operation being repeated until it is sufficiently fine for table, leaving the inferior oil for various purposes connected with the household or farm.

In Tuscany, at this season, a great deal of attention is given to the snaring of birds, which are abundant, and in which amusement our host took a degree of interest that rather surprised us. A few days after our arrival, he took us into one of the upper rooms of his house, where we found upwards of fifty birds of various kinds, all chirruping and singing away most lustily. Each bird occupied a small willow cage; and noticing that some of the thrushes were blind, we found that their sight had been purposely destroyed, by passing a hot wire over their eyes, in order to make them sing better. Cruel as this custom was, it certainly had the desired effect; for the poor birds appeared to be dreaming of the bright sunshine, and the pleasant tree-tops, and poured forth a stream of song that was almost painful to listen to. These birds were used as decoys, at what is called the 'Paretella;' and at a very early hour, our priest and his man were to be seen, like Machiavel,

—'Sallying forth
In an autumnal morn, laden with cages,'

to the scene of operations. The Paretella is a snare for small birds by means of a net, and the one belonging to the priest we shall describe. At the extremity of a ridge of high ground that ran out like a promontory into the valley, there was a green plot about thirty yards long and about fifteen in width. This was enclosed on three sides by a low hedge, and in and about this hedge perhaps thirty of these cages were concealed. In the centre of the ground there was a broad bed of dwarf beech, about four feet high; with its branches properly trimmed, and adapted to the feathered taste and habits; and alongside of this a large net, attached to a frame, lay on the ground, but so arranged by apparatus, that by drawing a bolt, the net would fly up and envelop the beech hedge. A hut was sunk in the earth at the end

of the ground—the roof being concealed by pine branches and other green stuff—and in this the operator could stand, with a cord in hand commanding the bolt, and through a small aperture watch for the game. Most of our favourite birds had names, and could be distinguished by their pipes. 'That's Pietro,' said the priest. 'Bravo, Pietro!' Poor Pietro trilled his notes, and Beppo whistled, several others chimed in, and we betide the luckless bunch of feathers that should come within hearing of that siren choir! Presently a few birds would fly over the ground; but attracted by the vocal harmony, they would wheel round, and drop on to that tempting beech hedge, to see what was going on. In a moment the priest's hand was on the cord, up flew the net over the poor birds, and our host, like a great black spider, stalked out to clutch his prey. The game bagged, the net was thrown back, the apparatus readjusted, and we all slunk off to await further victims. We took larks, becafcos, and numerous other small birds; indeed everything was game that came to the net; and in a few hours they were hissing and sputtering, all in a row, over our kitchen fire.

The thrush is taken with lime, and is much esteemed as a delicacy. The spot selected for this operation is a bit of elevated ground, which is closely planted with shrubs and evergreens. Between these plants, which are not more than eighteen or twenty inches asunder, they place twigs smeared with lime; and in the midst of this plantation a boy is concealed, with two or three cages of decoy birds. Attracted by their noise, some curious thrush visits the place, alights on the fatal twig, and is speedily secured by the boy. In this manner a great number of birds are taken, and hardly a day passed without our having a dish of them either at dinner or supper.

Our reverend friend, with whom we resided at this time, was the youngest of three brothers, the eldest of whom was an advocate, and the second a physician, in the beautiful city of Florence. Under such circumstances, it only remained for our host to conform to the wishes of his family, and go to the church.

In person he was tall, and rather handsome; but far from meeting the austere priest that we had pictured to ourselves, and almost dreaded to encounter, we found him at once the easy, courteous, talkative man of the world, or what is commonly termed 'a jolly good fellow.' For him 'the lines had fallen in pleasant places—he had a goodly heritage;' and with his gun on his arm, and his dogs at his heels, his whole time and attention seemed to be given to sport, and to overlooking the extensive and fertile domain which appertained to the family.

During our sojourn with him, he certainly did say mass once or twice in the neighbourhood; and, conforming to the rules of the church, he fasted twice in the week—an act of self-denial in which we begged to join him; for we very innocently considered that a repast of fish and eggs, various vegetables and omelets, salads, and all the delicious fruits of the season, together with wine *ad libitum*, was, after all, a kind of mortification of the flesh that was not to be despised. We noticed that the only time he permitted his usually sweet temper to be ruffled, was when he came in contact with his old cook in the matter of some dinner grievance. Quietly rising from table on such occasions, we could see his brow darken, as he proceeded to the kitchen to call the old woman all the hard names he could think of. Being rather deaf, and having been in the family time out of mind, the old crone had become a sort of chartered sinner; and on the principle that every man is a hero save to his valet, so we thought that our priest might very well pass for an angel except to his cook; for we verily believe that, whatever the rest of the world thought of it, in his own kitchen he was not regarded as such. The old woman had a quiet and provokingly cool method of going about her affairs, and she generally weathered the storm well; while on the part of our host, he usually

took himself off in a fume, and walking up to an old Dutch clock that hung in the antechamber, he, by a few vigorous tugs at the cords, immediately wound it up. The operation seemed to have a wonderful effect upon his ruffled spirit, for he generally returned to table, took his seat again with most dignified and clerical composure, and with a degree of serenity depicted on his countenance that was delightful to contemplate.

IT IS POSSIBLE.

PRIVY-COUNSELLOR STRYK had perpetually upon his tongue three words that had become to him a kind of proverb: 'It is possible.' It often happened that he used them in the reports made by him to the minister in full council; and when this occurred, a smile, such as is usually given to our neighbours' weaknesses, played upon the lips of his colleagues.

Privy-Counsellor Stryk, nevertheless, was held in high consideration. The different rulers of the electorate, in their turn, showed their appreciation of his varied information and talent by always employing him. Every one did justice to his ability and tact—nay, perhaps a little overrated them; and Stryk, open, upright, and conscientious, was looked upon as a deep and subtle politician, with a penetration and far-sightedness little short of the gift of prophecy. And all this reputation he owed solely to the three words—'It is possible.'

Often, however, they escaped him almost involuntarily; yet when they had once escaped him, he thought himself bound to follow up and maintain their consequences. Thus this saying exercised the greatest influence upon his opinions, his habits, and all the events of his life. Who could believe it of a man so learned and enlightened? And yet it was not only possible, but true.

He was himself fully aware of this influence, and yet not only did he remain constant to his three words, but he was seriously anxious to impress his only son with the same conviction of their omnipotence. The young man, who, like most other young people, thought himself much more clear-sighted than his old father, considered this as nothing more than a very singular mania.

'This little oddity, my dear father,' he said, 'may be excused in you, but my adopting it would be considered a mere piece of affectation, a ridiculous copying of you.'

'It is possible, my dear Frederick,' said the privy-counsellor; 'but you may let laugh those that will, when you have in these three words the secret of prudence, repose, security, and happiness. Think not that this maxim became habitual to me by mere chance. I adopted it upon sad experience that led to mature reflection. I owe to it all that I have, all that I am. The misfortunes of my youth, and despair, made me first lay hold of it; and once laid hold of, I raised myself by its help, and reconquered fortune. The little patrimony bequeathed to me by my parents only sufficed to enable me to subsist while studying at the university; and yet, because I carefully avoided debt, I passed for having a comfortable competence, and was welcomed into society that would have disdained me, had people known that I was all the while content with bread and milk as my whole dietary. I was well received, and generally esteemed, yet I had but one bosom friend amongst the men, and but one lady had ever engaged more than a passing thought; and pretension to her, the daughter of a general officer, was hopeless, and would have remained so, had not fortune smiled upon me most unexpectedly. I was made chamberlain to the dowager-duchess, with a good pension; and shortly after, a cousin died in Batavia, and left me a considerable property. Unwilling, in my first hours as an accepted lover, to leave my Philippina, I gave full powers to my friend Schneemüller, the friend of my

heart, my second self, and despatched him to Amsterdam.'

'You never before mentioned this friend to me,' said Frederick.

'It is possible,' answered the privy-counsellor; 'and I will soon tell you why. Alarmed for his health by his long delay and total silence, I sacrificed love to friendship, and tearing myself from my Philippina, while she, overcome with grief, was yet fainting in her mother's arms, I set out for Amsterdam. Suffice it to say, I discovered that my best friend had deceived me, and was by this time in America with the whole of my cousin's bequest. "It is impossible!" I cried; "it is impossible!" But soon I was obliged to say, "It is possible!" And I flew back to Philippina, to soothe the feelings wounded by the treachery of my friend; and again I was compelled to say, "It is possible," when the first greeting on my arrival at home was the announcement that, three days after the letter conveying the tidings of my loss, my betrothed had become the bride of another. I spare you my agonies. Henceforth I believed everything possible but good to me; and no matter how improbable any suggestion seemed, I replied, "It is possible!" In these three words was embodied my whole system of practical philosophy. I kept continually repeating them, till at length they became a comfort in sorrow—an antidote to despair. When I said to myself, "Canst thou ever again be happy in this world?"—my lips formed the words, "It is possible;" and the event justified the almost mechanical hope. I adopted the maxim, and no longer lived in an ideal world peopled either by angels or devils—the youthful heart seldom knows any medium. Henceforth good fortune had no power to intoxicate, for I thought of its instability, and said, "It is possible;" and misfortune could neither surprise nor wholly depress me, for I was prepared for anything. Men in general act in the ordinary, as well as the more important concerns of life, upon a sudden impulse, for which they can hardly account, and of which they are almost unconscious. Take my advice, my son, adopt my maxim, were it only to give you the power of self-possession, and make you ready either to do or to suffer. Repeat it till you have made it your own. This at least is possible.'

The favourite phrase of our privy-counsellor sometimes proved unpropitious; but he was not easily dejected. For instance, one day when the elector presided in person in the council, some debate arose upon the late French Revolution of '93; and as the many changes were mentioned in the people who once so idolised their kings, the elector exclaimed, 'The French are the most abominable race on the face of the earth: no other nation could act as they do. Can you fancy my subjects ever being seized with such madness—ever abjuring their allegiance to their prince? What is your opinion, Stryk?'

The counsellor, just then in a fit of absence, had only half heard what the elector said, and shrugging his shoulders, said mechanically, 'It is possible.'

The elector turned pale. 'What do you mean?' he exclaimed. 'Do you think that a day can ever dawn when my subjects will rejoice in my downfall?'

'It is possible,' again said the counsellor; but this time he said it advisedly. 'Nothing is more uncertain than popular opinion; for a people is made up of men, who have each an individual interest, which they prefer to that of the prince. Any new order of things begets new hopes. Whatever may be the degree of love, and however well deserved, borne by the people to your highness, I would not swear that they would not, in new circumstances, forget the benefits of their prince, and that we might not see the electoral arms broken, to give place to the tree of liberty.'

The elector turned his back upon him, and Stryk was disgraced; while every one cried, 'What a fool with his "It is possible!"'

A few years after, the victorious French passed the Rhine; the elector, with all his court, took to flight.

As he departed, he saw the tree of liberty planted, and the armorial bearings of the electorate broken publicly by the people.

Stryk being looked upon as a victim to the despotism so lately overthrown, was soon installed in the office which his talents so well fitted him to fill; and by his diplomatic ability, contributed not a little to the establishment of the new order of things; while, notwithstanding his natural ardour of character, he never suffered himself to be carried away by political enthusiasm. But attaching himself to no party, he became an object of suspicion to all. The Jacobins treated him as a concealed royalist, and the royalists as a disguised Jacobin. Still he cared not what name they gave him, and quietly went on with his official duties.

One day a commissary of the republic arrived in the new department, and was received with the greatest honours. All were crowding around him; all eager to pay their court; and some amongst them ventured to throw out insinuations against Stryk, and the lukewarmness of his republican opinions. The commissary made no remark at the time; but one day, at a public dinner, at which many toasts went round in honour of universal liberty, the rights of nations, and the triumphs of the republic, he suddenly turned to Stryk, saying, 'I marvel that kings yet dare to resist us, for they do but thus accelerate their own ruin. The revolution will make the circuit of the globe! What hope is left to them? Do they dream of ever again bending the great nation, and bringing back the Bourbons? Fools that they are! all Europe must perish first! What think you, Citizen Stryk, can a rational man admit that monarchy can ever be re-established in France?'

'It is possible,' said Stryk.

'How possible?' cried the commissary in a voice of thunder. 'He who doubts of liberty has never loved it. It grieves me to see a public functionary holding such opinions. Can you state any grounds for them, citizen?'

'It is very possible,' answered Stryk calmly. 'Free Athens first became accustomed to Pericles, then to a king of Macedon. Rome had at first its Triumvirate, then a Cæsar, and at length a Nero. England had its Commonwealth, bowed before a Cromwell, and recalled its king.'

'What are you at with your Romans, your Athenians, and your English? I hope you do not dream of comparing them with the French? But I forgive your false views: you have not the honour of being born a Frenchman.'

The forgiveness was not, however, a complete one, for Stryk lost his office, and underwent some persecution, as an utterer of language not sufficiently respectful to the republic.

Some years afterwards, Bonaparte became First Consul, then consul for ten years, next consul for life, and finally emperor and king. Stryk was immediately reinstated in his office, as being ostensibly one of the moderate party. He enjoyed more favour and credit than ever; his predictions had been again accomplished, and he passed for a consummate politician.

Napoleon changed the face of the world, and disposed of crowns at pleasure. Stryk became prime minister to one of these new-made kings, and obtained titles and honours. No such thing as a republican was to be found; all crawled in the dust before the new master. It was felt as a stigma to have ever imbibed republican opinions; and every one claimed credit for having been the only one not carried along by the current, and eschewed the shame of having ever been anything but a royalist.

'I see no shame in it,' said Stryk: 'an epidemic raged, and you caught the infection. It may appear again, and you may be again attacked. It is possible.'

'What!' was the indignant reply; 'do you deem us so weak as to be for ever changing?'

'I never forget,' answered Stryk, 'the sultan of Egypt mentioned by Addison. This sultan was scepti-

tical enough to laugh at an aerial voyage said to be performed by Mohammed, in which numberless transactions took place in so small a space of time, that Mohammed, at his return, found his bed still warm, and took up an earthen pitcher, thrown down as he was carried away, before the water was all spilled. A dervise, who had the reputation of working miracles, undertook to cure him of his incredulity; and in presence of his whole court, ordered him to plunge his head into a tub of water, and draw it up again. The sultan obeyed, and plunged his head into the water; but on the instant he did so, found himself at the foot of a mountain on the sea-shore. Conceive his surprise! He execrated the treachery of the dervise; but he was obliged to submit to his fate. Some woodcutters near directed him to the next town, where, after several adventures, he married a woman of great beauty and fortune, with whom he lived so many years, as to have fourteen children. At her death, he was reduced to get his livelihood by plying as a porter. He now heartily repented the scepticism of which he believed all these misfortunes to be the punishment. In a fit of devotion he threw off his clothes for the ablution usual with the Mohammedans before prayer, and no sooner raised his head after the first plunge, than he found himself before the tub, and heard from his whole court that he had never stirred, and that all the events that had so troubled him had been crowded into the short space of time necessary to dip his head into the water and take it out again. Gentlemen,' continued the old privy-counsellor, 'yours is a parallel case with that of the sultan of Egypt. If you had been told before the Revolution what you would do during its progress, you would never have believed it; and now that you have drawn your head out of the tub, you remember nothing of what you have thought, done, and experienced in the days of miracles. If the Bourbons and the emigrants ever enter France, they will look upon the history of the years that have elapsed since 1789 as a delusion, and will find themselves, like the sultan of Egypt, standing by the side of the tub, regarding their years of suffering as a deceitful dream.'

There was a general laugh. 'Well,' said some, 'you may not be so much out in your conjecture if they did return; but who ever dreams of the poor Bourbons being restored? This would indeed belong to an age of miracles.'

'Hem! It is possible,' said Stryk.

But the Russian campaign was contemplated, and one of Napoleon's generals asked our friend's opinion as to its successful issue. The privy-counsellor declined answering; and the general, surprised at this reserve, said, 'For my own part, I expect to celebrate the New Year in St Petersburg: but you seem to apprehend an unhappy issue?'

Stryk, as usual, shrugged his shoulders and answered 'It is possible.'

This answer was not forgotten, and his name was soon erased from the treasury list. When the allied powers invaded France, and Napoleon's creations were crumbling into ruins on every side, every one said, 'Stryk is a prophet, and has had the fate of all seers.'

His disgrace under the government of the usurper, as the fallen emperor was now termed, was sufficient claim upon the favour of the new legitimate monarch. But it was not long before his axiom brought a fresh storm upon his head. The monarch giving him one day to understand that his adhesion to every successive government tended to make his loyalty somewhat suspicious, the old man reminded him that his sincerity in his own moderate political views was proved by the fact, that he had the misfortune to displease only when each government pressed on too enthusiastically, and were not satisfied with his discharge of duty to his country, whoever might be the master. 'The state,' he added, 'has always need of the services of its citizens, and it is their duty to serve it in every circumstance.'

'The state,' said the prince, 'is the sovereign. Who dares to separate his person from the state is a rebel in heart.'

This was his last disgrace; but he was still faithful to the maxim that had taught him moderation, and at once salutary distrust and hopefulness. When the improbability of further political changes was pressed upon him, now that the Bourbons were again firmly seated, he answered, 'It is possible. They want to go back to the Inquisition, to the holy alliances. The cause of truth, of civil and religious liberty, is attacked; the freedom of the press is assailed. Thus was it in the days that produced a Franklin and a Washington—the days of the Bastille; thus was it in the time of the Fouchés and the Rovigos. The same causes produce the same effects. It is possible.'

But his maxim taught moderation to no one but himself; and the three days of 1830 proved its truth, and revolutionised the king of France into king of the French.

The oracle appearing no longer necessary to a ruler who was in his own person the very type of the vicissitudes of human life, it ceased. Stryk died. But who that has lived to see 1848 can decline to admit, of anything or everything, 'It is possible?'

WHIMSICAL NAMES OF PLACES.

A PARTICULAR district of Scotland, almost limited to the Lothians and their immediate neighbourhood, is remarkable for the frequent occurrence of whimsically-named places. One on the borders of Peeblesshire is itself called the *Whim*, the reason being, that it was originally a moss, which, lying at an elevation of about 800 feet above the sea, seemed a most unsuitable place for a gentleman's mansion; yet the Earl of Islay determining, nevertheless, to rear a retreat for himself upon the spot, some one called it a whim, and his lordship chose to adopt the joke as an appellation for the place in its new form. Not far from this spot there is a place called *Cauld-kouthers*; another near by bears the name of the *Plot*; while a third is styled *Laugh-at-the-Lave* (lave meaning the rest); all doubtless bearing a like significant reference to some circumstances in their history. Names expressive of disadvantageousness of situation are abundant. The number of places called *Cauldcoots* would have been marrow to the bones of Church-hill, had he known them. There is even one called *Dead-for-could*. *Cauld-backs* and *Cauld-wa's* are names of farms in Fife, where also there is a place called *Hunger'im-out*. In the same county is a lonely cottage called *War's-end*, and another insignificant place styled *Sma'-allowance*. *Blaw-wearies*, too, are not infrequent; and there is a spot in Linlithgowshire called *Mount-cerie*, a term expressive of lonely and dismal feelings. On the other hand, there is no want of merry names—a *Wanton-wa's* near Musselburgh, one in Fife, one near Lauder, another between Bathgate and Linlithgow. *Canty-hall*—as if we were to say cheerful hall—is a place near Carberry, the scene of Mary's rendition to her lords. *Stocken-drouth*, which implies the allaying of thirst, and dates from long before the days of teetotalism, stands on the old Glasgow road near Edinburgh. *Blink-lonnie* is a farm near the same city. Sometimes the appellation conveys the idea of local jokes which prevailed at the inauguration of the new locality—as where we have a *Brisk-forrent* near Dechmont Park in West Lothian (forrent meaning opposite in situation, as with partners in a dance), or *Cock-my-lane* on the road from Edinburgh to Hamilton, a phrase expressive of one complacently taking up a station by himself. We may be very sure, too, when we see a seat of Lord Torphichen called *Contentious*, that there was some merriment connected with its christening. In other cases, we may see that the term has sprung from some quaint reference to the character or circumstances of the builder or first occupant, as in *Warlike-through't* (Struggle through it), and *Wha-wad-ha'-thought-it*, in Fife. Sometimes there is a sarcastic or ironical reference, as where we find a place near the very crest of the bleak Soutra called *Mak-him-rich*, or in such a case as *Dry-pock-Mill* near Ford. In Scotland, whenever a tailor builds a box for himself, it is sure to get the name of *Cabbage-ha'*, repudiated by the worthy owner himself, but sure to be recognised when the property has passed into other hands. *Souter-ha'*, a place in Fife, has a similar origin: in the same

county, a little retreat built by a 'writer' obtained the appellation of *Pow-and-ink*. In *Haud-him-fa'*, which occurs at the Coulsland lime quarries, we may read some unknown incident of past days. And an unsuccessful elopement appears very plainly in *She's-ta-em*, an out-of-the-way spot in a valley called Heriot's Cleuch, near Gala-Water. Broad insinuation may be said to rest in *Clock-him-in*, the name of two places, one near Niddry, the other in Ormiston parish, Haddingtonshire; which, by the way, reminds us that Scott strangely perverted this appellation in his *St Ronan's Well*, when he made it the name of an inn kept by one of the most sternly virtuous of her sex, and got up some ridiculous description of a churchman with a crozier as a sign. The real meaning obviously is, 'Hook-him-in.' Then there is a height called *Glowr-o'er-em* near Linlithgow. It will be remembered that my Lady Glowr-o'er-em is a formidable character, with a charge of grown daughters, in some one of the Waverley novels. *Pickdellem*, a place between Cupar and Newport, in Fife, evidently implies the former residence of a miser at the place, as does *Scart-the-gither*, another place in the same district. It is difficult to perceive any reason why, while such names are abundant in Edinburghshire and some of the adjacent counties, Selkirk and Roxburghshires should scarcely present a single example.

THE GIPSIES' SONG.

FROM THE 'PRECIOUS' OF C. M. WEBER.

In the wood—in the wood!
In the fresh green wood!
Where echo calls loud—
In wood and wild where echo calls loud:
There rings our horn, there shouts our song,
So bravely the silent forests along—
Trarah—trarah—trarah!

The night—the night!
The raven-black night!
Up fellows!—watch well!
Through the raven-black night watch well! watch well!
The wolf prowls around—not far from our ground,
But he rather dislikes the bark of our hound—
Wow-wow—wow-wow—wow-wow!

The world—the world!
The great wide world!
That is our tent!
The world is our tent!
And so on we wander, and shake to our cry
Woods, valleys, and rocks, and the earth and the sky.
Halloh—halloh—halloh!

M. S. J.

SECRETS OF VENTILATION.

Let the air enter the house freely by a large aperture, like a common window, and capable of regulation in the same way. Let it enter a stove room, and be there completely warmed, then let it pass freely through the whole house, and enter all the apartments either at the doors or by express channels. Take off the used air by the chimney and an open fire; or for crowds, provide larger and express openings—there is no more to be done. Houses that we have seen ventilated in this simple, unpretending, unmysterious manner, are the best ventilated we have ever entered. It is too often the fate of the mysterious little pipes, funnels, tubes, and valves by which ventilation is frequently symbolised, rather to indicate ventilation than to effect it.—*Illustrations of the Theory of Ventilation.*

REMEDY FOR TOOTHACHE.

A mixture of two parts of the liquid ammonia of commerce with one of some simple tincture is recommended as a remedy for toothache, so often uncontrollable. A piece of lint is dipped into this mixture, and then introduced into the carious tooth, when the nerve is immediately cauterised, and the pain stopped. It is stated to be eminently successful, and in some cases is supposed to act by neutralising an acid product in the decayed tooth.—*Lancet.*

STOCK AND WORK.

Stock is a fine, honest, well-to-do business man, always dressed in good broadcloth, with a pair of handsome top-boots, and very anxious to have everything comfortable about him. Work is a rough, sturdy fellow in a fustian jacket, and seldom a clean face, but not by any means generally ill off. Both are sound-hearted Englishmen, that would fight to the last drop of their blood, and last farthing in their purse, for the honour and safety of their country: they would go heart and hand together against any envious foreign dog who should think of troubling them; yet they have occasionally very bitter-looking quarrels between themselves. It is rather an amusing sort of contention that Stock and Work fall into, not unlike those squabbles which sometimes take place about trifles between man and wife, while both know all the time that they are the best friends in the world, and that their interests are absolutely identical. The tussle, nevertheless, sometimes gets to a great pitch; and if you were to judge from their looks and words, you might suppose them to be on the point of killing each other. Work has even been known to threaten Stock with a cudgel, and two or three times he has gone to the public-house and sulked for a week or two, declaring he would never see Stock's face again. But somehow the wife and children always get round him, and, being an excellent fellow at bottom, he generally consents to forget all that has passed, and become good friends with Stock again, before any irremediable mischief has happened.

Stock and Work had an unusually dreadful quarrel not long ago. It began on Work's side, but was not so much his own blame, as that of certain foolish companions, who wished to persuade him, even against his own feelings, that he was extremely ill-used. Work, being at last fully incensed by these evil advisers, broke out upon Stock one day with the utmost fury, inasmuch that some people expected to see nothing less than bloodshed. Stock acted like himself, and stood quite still, while Work went on like a raging devil, calling him all sorts of bad names, and threatening to knock his brains out. Well did Stock know whence came all this violence: he could not but feel angry, but the very violence of the assault served to keep him calm. When Work had said his worst, he went away muttering threats of vengeance against Stock; and it is said he was not heard to speak one pleasant word at home for a week after.

Stock took the matter very highly at first, said he could not stand this kind of nonsense continually, and that he would rather go abroad, and see if he could do any business there, than be exposed longer to such annoyances at home. 'It is true,' he said, 'Work and I have been brought up together, and have maintained

a worrying kind of friendship all our days: I like the fellow with all his absurdities, and I believe he has a secret respect for me too; but really to be exposed every now and then to such attacks as these, is more than my temper can endure. It makes me quite uncomfortable in my own house. I believe I am falling out of my clothes purely in consequence of it. Far better we should make an end of it, and part.' Some mutual friends thought it would be a pity if two such old associates were to break entirely off with each other, particularly as the consequence to Work must be that, without support from Stock, he and his large young family must be thrown upon the parish. So they interfered to bring about a reconciliation—in which, by the by, they found the chief difficulty to be with Work, who had given all the provocation. At last he was prevailed on to come to a meeting, where Stock was also to be, that they might, if possible, have at least some peaceable conversation on the matters in dispute.

'Well, Work,' said Stock, as soon as they met, 'you seem to be calmer now. What is it, I should like to know, that you have to say against me? or what excuse have you to make for that affront you put upon me a week ago?'

'Why, Mr Stock,' answered Work, 'the fact is, that we men are beginning to think that we are oppressed by you masters; and that, because we are poor men, and cannot help ourselves, you pay us only such wages as you choose, and thus make great profits, while we starve. We have had it all fully discussed in our union; and it must be true, I take it, for nobody has a different opinion.'

'A pretty reason for its being true indeed! You hear only one side; and because there is no dissentient voice, you conclude that there is nothing to be said to the contrary.'

'But you masters hear only one side too, and never listen to a word that we have to say; or at least if you hear it, you knock it down with some piece of political economy which we do not understand, so it is the same to us as if you had not heard it.'

'There is some truth in what you say; at least, grant there is. It is only, like your own, a very natural error. But I will, if you please, pursue a different plan. I will listen to everything you have to say, and give it a candid consideration. So, if you listen as candidly to such answers as I can make, we may have a chance of coming to a right understanding.'

'Very well, sir; all I would stipulate for is, that you give me no political economy, for that is a thing evidently got up to keep down the working-people, and we can't abide it now. All the mischief comes from that, I think.'

'I don't intend to resort formally to political economy in our conversation, but I will bring forward common-

sense views, which perhaps a political economist would say came to the same thing. I may remark, however, that political economy is not rightly regarded either by its friends or its enemies. It is a new science, trying to make out the natural laws which govern the operations of industry and the disposal of the results. If it can do so, it will be a boon to us all, and therefore we ought to treat it with respect. But then, as a new, it is an imperfect science: many of its dogmas would require the stamp of experience to sanction them. If its friends would keep this in view, and press their doctrines with caution, and if its enemies would make some allowance for the ardour of its friends, and believe all to be well meant, though much must be mistaken, then I think political economy would assume a truer position than it at present enjoys, and some good might be derived from it. Let us hear, however, what charge you have first to bring against us masters?

'Why, the first charge is, that your wealth enables you to oppress us; and you do it. We feel that capital is always, somehow, the enemy of labour, and we hate capital accordingly. It is the one accursed thing which more than any other makes this a world of misery.'

'That is a serious charge indeed, but I hope it is substantially an unjust one.'

'Does not the master use his capital to get our work, which makes him still richer, while we never are any richer? and does not he employ his additional wealth in repeating this process, till the difference between his grandeur and our poverty gets beyond all bounds?'

'He does use his capital to get your work, and this makes him still richer; but he is not answerable for your continuing in poverty. Instead of being poorer by reason of his capital, you are the richer. It gives you comforts which you never could have otherwise enjoyed.'

'I should like to know how that is the case. I assure you I feel nothing of the kind.'

'Yet the fact is certain, that wherever there is no capital, the working-people are in misery, and only where there is much capital is there any considerable portion of them well off. A learned Frenchman has pointed out that, according to Homer, it required twelve women to grind corn (which was then done by hand-mills) for the persons composing the household of Penelope, queen of Ithaca. He estimates this as probably one person for every twenty-five. Now, a large mill, got up by capital, can grind corn for a hundred thousand persons, while only employing about twenty men; that is, one person employed for every five thousand consumers. Where the products of toil were so small as amongst Penelope's grinders, they could only be supported by some wretched pittance, whereas the mill could give good wages to its workmen, because, from the use of capital, its products were large. For the same reason journeymen bakers are a slavish and ill-paid class of men. The concerns are usually small; the masters ill provided with capital; little or no aid is taken from machinery. The men must go through much toil, and be content with poor wages. But there are a few baking concerns throughout the country which are conducted on a large scale by men of capital: there the journeymen are as well off as any other working people, purely because, by means of capital, the products are comparatively great in proportion to the toil. In one of them, if not more, the bread is sold cheaper than it is by other bakers, and thus the public is benefited also by capital.'

'This may be all true, but it is too deep for me. I

only feel that we workfolk are always poor, although it is we who make all the things which other people enjoy. You masters make nothing. The rich people who are not in business do nothing but enjoy themselves. We toil for ever, and are never any better for it.'

'Well, I don't know how you come to think so. One half the masters in my circle of acquaintance were working-men—they have been the better of their toils. Almost all the men who have good situations about works or stores were once common workers—they have been able to make things a good deal better. A good many men I once knew as operatives, I now see keeping shops, and doing well in the world. That is another portion of the people who, you say, make everything, but are never the better of it. If you fix your attention only on those who are working-men at any particular instant of time, it may appear that they are not improving their circumstances, for nobody makes a great advance in a moment. But observe the progress of the class through a few years, and you will find that many go on to be something much superior to what they were at starting. The clever, diligent men, who can take care of their earnings, are almost sure to rise.'

'Ay, that is what we are always taunted with. We are expected to save where we scarcely make enough to keep body and soul together. I should like to see some of you masters called upon to save out of fifteen or eighteen shillings a week.'

'It might not be easy; yet I do not see that it is impossible, when there are men who have less wages, and can live upon them. Perhaps there are some unreasonable expectations formed regarding the ability of working-men to save. I can easily see how liable the inducements must be in many cases to fail before the difficulties. On the other hand, no improvement of any kind can be achieved except by a manifold grappling with difficulties. Setting this aside, there is a vast number of working-men who have comparatively high wages, out of which they might spare a good deal; and yet they never lay aside anything. I do not, however, call for mere hoarding—or at least not hoarding for its own sake. But I should like to see working men get above the practical degradation of living each week on the proceeds of that week only. People who are content, year after year, generation after generation, to go on in the state called *from hand to mouth*, liable any day to fall out of work, and then become dependent on charity, are virtually slaves, though they do not bear the name. From this there must be some means of redemption, if it only could be hit upon—the principle of assurance has been suggested. Anything would be better than this living constantly next door to pauperism.'

'Robbed as we are by capitalists, it is all little enough that we come upon them for support when we are out of work. It will be long before we get back all our own from them—for is it not we who are the foundations of all their wealth?'

'I think labour is the foundation of all wealth; but I do not think any particular generation or description of labourers are so. The man who devises and directs is as truly a labourer as the man who works with his hands. Capital is also concerned in the case, and this is just the hoarded results of the shares of proceeds belonging to such of the labourers, whether with mind or hands, as have chosen to save, and been able to preserve and transmit their savings. So when we say labour is the foundation of wealth, we mean hoarded

labour—that is, capital—as well as living labour, which is the toil of the men actually engaged in the operations.'

'Oh you have got to political economy now. I give you up of course, for that is all jugglery.'

'It surely is a clear case. Say two men work in felling timber with such instruments as they can readily get. One spends all his wages; the other saves a little, and buys superior tools, with which he does a third more work, so that he presently obtains a superior income to his companion. Thus enabled to spare still more, he at length becomes the employer of that companion, and of other men, and finds it only necessary to direct the work and sell the products. In this case labour is the foundation of the whole concern, but it is not the labour of the men alone now working—the savings of the master and his management are also concerned. And it is a mere abuse of language to say that the master robs his men because they do not get all.'

'Look to the results, however. You cannot deny that there is a fearful and shameful difference between the two classes who are concerned in labour. There is vast wealth amassed in this country, but it is in the hands of a few. The working-people are poor, and every twelfth person in England is a pauper.'

'I do not believe it is true that the wealth of the country is in the hands of a few. The funds are divided amongst a great multitude. The depositors in banks are very numerous.* There is nearly thirty millions in the savings' banks, mostly belonging to persons in comparatively humble circumstances, though but a small share, I believe, to artisans. Some very rich people there are, but they form the exception, not the rule; and such prodigies of wealth have existed in all civilised countries in all ages. Generally, it may be admitted that the employing class present a remarkable contrast in point of wealth to the employed; but I believe this distinction is not a necessary or unavoidable one to nearly the extent in which we see it existing.'

'Yes, it would be less if we had justice, and got our due share of the profits. To that we must come. The workmen must be taken into the concerns as partners, and not fobbed off with a mere weekly salary, which is spent in tradesmen's shops as soon as it is received.'

'Well, I know of no law which could compel a master to take his workmen into partnership with him, and I see no justice in making one. But neither is there any law to prevent masters and workmen from going into such an arrangement if they choose. Men may be guided on this subject entirely by their sense of what will be for their interest. Only it must be observed that, if masters advance all the capital, they must continue to have profits in much the same proportion as at present; and it would therefore be necessary for the workmen, if they wished for much larger incomes, to put in some share of stock, or allow a portion of their wages to run up for that purpose. The advantages of the plan would be, its creating a necessity for self-denial in the operatives, its giving them something to hope for, and its raising in them an interest in the business in which they are engaged; capital and labour would then be more essentially connected than they now are, unless, indeed, the men were to begin at length to hire substitute workers out of their profits, which would leave matters no better than they had been. Supposing it be determined to try this system of extended partnership, the workmen must expect difficulties, and be prepared for the occasional losses which are inseparable from all ventures—even for bankruptcy itself as a possible event. It might be that they would come to think in many cases that they would have

been as well with their clear, definite, ready-money wages, provided only they could have taken some care of them, and not spent all on immediate enjoyments.'

'What, then, do you suppose to be the cause of the working-class being so distinguished from all others by their poverty, if it be not that they get less than their fair share of the proceeds of labour? Give me some daylight upon that point if you please?'

'I believe that, in all concerns whatever, the workmen must ever have their fair share of the proceeds: it is by an irresistible law that this must take place. But from whatever cause—whether from something attaching to the wage system as not engendering hopefulness and care as to means, or from mere ignorance and bad habits—the working-classes do not in general make so good a use of their resources as other people do. When I contrast the frugal life of many poor shopkeepers, struggling to pay rent and taxes, with the self-indulgent lives of many workpeople whose gains are much greater, and see how decent and content the one set appear as compared with the other, I cannot but think that the latter are either morally inferior by nature, or that there is something in their circumstances which makes an approach to the respectable behaviour of the middle classes too difficult. Fools and knaves are constantly flattering them with the notion that their employers and the government are to blame for all their sufferings. Very natural to think anybody in the wrong but ourselves—but very dangerous too. I thoroughly believe that they get more than their strictly just share, for there is a constant and copious stream of beneficence running down to them from the more frugal middle classes—by which, again, their own interests are injured, for the money thus spent is so much abstracted from the capital which otherwise would be affording them remunerative employment. He would be their true friend who should endeavour to show them how much they have in their own power to correct the evils in their condition; how one desire curbed was a greater advance to them than any act of parliament could be; how one aspiration for cleanliness in their dwellings, and the maintenance of good order in their families, was better to them than a gift of gold.'

'All this is preaching to the winds. Though I am not able to controvert what you say, I know that we all feel something else to be necessary. Many of us are now suspecting that the evil lies in competition, and that its only perfect remedy will be in going upon the opposite principle of co-operation. I have heard many good arguments for that principle, and it is working tolerably well in some places.'

'The sole question concerned there seems to me this—What motive are men to have for exertion? Hitherto, we have seen them usually proceeding upon the motive of individual interests. This is not a high motive; but it serves, in the meantime, to keep up a system of immense activity; and the results are magnificent. If men could be animated to equal exertions by kindly social feelings, each emulating the other in public services, without regard to his own immediate gain, it would be no doubt a better system, for it would develop superior feelings. But men would need to be considerably improved before we could expect the bulk of them to act on such disinterested principles. They may be fit for such a system in time, but they certainly are not so now. We must be content to put up with the many obvious evils of competition, only doing our best to soften them away by mutual kindness, until, in the progress of civilisation, the millenium of the higher sentiments shall arrive.'

'Then you expect us to remain content in the meantime with the evils which we suffer, in hopes that our grandchildren's grandchildren may be somewhat better off? I can tell you this won't do, Mr Stock.'

'You take me up rather too sharply. I think that much may be done for the immediate improvement of the condition of working-men. In the existing arrangements, your interest in the results of your labours is too

* It has come to our knowledge that a branch bank in a Scottish country town of five thousand inhabitants has deposits to the amount of £800,000, although there are other three branch banks in the same place. A village of eight hundred inhabitants in a rather poor district of Lanarkshire has two branch banks, in one of which there are deposits to the amount of £140,000.—Ed.

slight and evanescent. The rural worker should have a piece of the soil to work upon for himself, that he may feel an interest in the business he is engaged in. The manufacturing labourer should be something more than the weekly-hired *attaché*, with the world to begin again every Monday morning; though I cannot well say what it is he ought to be. Education and sanitary reform must be introduced as auxiliaries, and the bonds of social union between classes must be drawn closer. I trust that the middle and upper classes will ere long become generally cognisant of the force of what I say. They may depend upon it that the mere maxims of political economy will not suffice: these show how wealth is to be most readily produced, but they do not tell us how human beings are to be adjusted in the relation to wealth which is most conducive to the general happiness. There is prejudice on all sides to overcome. Do you, Work, try to get the better of what you find among your confrères, while I make the same attempt with mine. By and by we may meet again, and have another conference. Meanwhile, believe you have not a better friend than John Stock.

Stock and Work now parted. The latter was observed to be for some time after very thoughtful. What good may come out of the conversation we cannot tell, but he has had no squabbles with Stock ever since.

R. C.

THE LAWYER'S FIRST CLIENT.

BY PERCY B. ST JOHN.

IN the year 1782 there came from Paris a lawyer to establish himself in Arras, his native town. He was young, full of scholastic learning, but fuller still of Rousseau, whom he worshipped, and Voltaire, whom he detested. Very young, having, in fact, but little passed the age of boyhood, he assumed a very humble appearance. Too poor to afford a servant, he took a young and attached sister, an orphan like himself, to reside with him as his housekeeper; and this done, while waiting for business, he devoted himself to study and composition. Small and even awkward was the little room which served as the student's cell, until it should become the advocate's chambers; but scrupulous was its neatness, as if to vie with that of the person of its owner, whose black shoes, shining silver buckles, unspotted white stockings, and ruffled shirt, showed one full of precision and method.

Early one morning he sat in his studio, an open book in his hand, but not reading. He was dreaming, as those dream who, without being exactly ambitious, foresee the future greatness of their part in the world's history. He was a small, pale young man, of a bilious complexion, with spectacles shading his eyes, and with a nervous twitching in his face and hands that seemed to denote a spirit restless and uneasy within. Near him sat his sister, who, having put away the breakfast things, and placed a plate of oranges on the table, had taken in hand some domestic work suited to her age and taste. The young man was at his third orange, a fruit which he constantly devoured, when there was heard a stamping of feet on the landing without, followed by a ring of the bell.

The young woman hastened to open.

There stood on the threshold a little old man, who, though poor in dress, and hungry and weary in look, wore the costume of a marquis. There were the laced ruffles and red heels, the sword, and every other necessary accessory, even to the look of self-sufficiency and importance, which Molière's satire had not eradicated. He seemed to hesitate, though the door was open, as if he waited to be quite sure of being right.

'Enter,' said the young lawyer, rising and laying down both his book and his visions: 'I am very happy to see you, Monsieur le Marquis.'

'More than any of your profession has said for a long time,' replied the little nobleman, bowing himself into a chair, and laying his old hat upon the ground; 'for I

am poor, a bore, and have rich and great men for my enemies.'

'Ah!' said the young lawyer with one of his nervous twitches, 'and they like not to see you?'

'Certainly not,' he continued, shaking his head; 'for though my cause be rich, I am poor.'

'You come to offer it to me?' said the young man dryly.

'It is not worthy of your acceptance, my dear young sir,' said the other with a doleful mixture of hope and dignity.

'You are, Monsieur le Marquis, my first client,' continued the lawyer. 'I know not what your case may be; but you avow, with the frankness of a man, that you are poor, and—here the speaker frowned, and pressed his teeth together—'that you have rich and great men for your enemies. I am your *avocat*.'

'My dear sir'—said the marquis.

'Excuse me,' interrupted the young man, who had been eyeing his client through his spectacles, 'but you have no doubt a long story to tell. You would not wish to deprive me of my breakfast?'

'Not at all,' said the other ruefully.

'But, Monsieur le Marquis, if I might presume to request you to keep me company, we can thus talk more freely. Sister, let us have breakfast.'

The marquis made a frigid excuse, to which no attention was paid, the sister smiled, and felt she could have kissed her brother, and then ran out to prepare the young lawyer's second morning repast.

'You have, I see, a written statement,' said the juvenile man of law, as the old nobleman opened a roll which he held in his hand.

'Yes, a full history. It is long, young man, but so has been my existence, of which this is the history; and speaking thus, he adjusted his spectacles, and began to read. At the first word, the man of law started, for the name revealed a case which had been before the Cour d'Artois eight years, but which, from the powerful position of the defendants, had never come to a final hearing. Lawyer after lawyer had been bought off, until the whole bar of the *état* was bribed against the poor old man. His case, however, was very simple.

Twenty years before, he had married his only daughter and child into a high and noble family. The more richly to endow her, he had given as her marriage portion every acre of property he had in the world, houses, castles, &c. When the contract was drawn up, his *homme de confiance* inserted a clause by which the whole returned to him in case of his daughter's death before his, and by which free use of the whole was given him during life. For twelve years all went well, and then the one link of peace was broken, for his daughter died. Her husband and husband's family at once resisted the return of the property, and went to law with their aged relative, who, after eight years of weary and tedious existence, had resolved on trying the talents and generous enthusiasm of a mere boy, for his *avocat* was scarcely three-and-twenty.

Though he knew the case well, the young man listened—it was ever his wont—without interruption, except to place breakfast before his client; but his mind was not always on the words he heard. His spirit overleaped the present. He was at length a man; for one his senior in years leant upon him for advice and support, and his race of life had begun. But vainly that strange being sought to raise further the thick veil of 'beyond': he saw nothing but void and night, filled, it is true, with scenes, actions, and moving creatures, but shapeless, meaningless, and without form.

'There is a case!' said the marquis in conclusion, looking hopefully at his legal adviser.

'There is!' exclaimed the young lawyer, starting; 'and I will this day and night write a "mémoire," which to-morrow shall be printed, and in a few days all France shall ring with your wrongs.'

The little marquis rose and seized the other's hand, for these few words showed his adviser to be in earnest.

The man who was capable of printing such an attack on a rich and powerful family was not to be suspected of retreating. After a few hurried words of thanks, he took his hat to go, leaving the manuscripts on the table.

'I will not stay, young man,' he said with a voice thick with emotion, 'for I shall hinder you from studying the matter. When may I return?'

'Stay,' said the other, musing. 'By six this afternoon I will have half done: I will then pause to dine. If Monsieur le Marquis will honour me, we can then read it over together.'

The noble client of the young man looked hard in the other's face, as if to read some meaning in this invitation; but his avocat was poring over the huge statement which he had given him, and he could detect nothing but legal acumen in the expression of his face.

'I will dine with you,' he said; and then he thought to himself, 'I will repay him when I gain my cause, if I can repay such services.'

And with a ceremonious and courtly bow the marquis went out.

'A client at last!' exclaimed the young man with a smile which was almost savage; 'and a grand case too. What subjects for invective against injustice, against oppression, against tyranny!'

'But, François,' said his sister with a smile, 'what am I to get for dinner?'

'Nothing more than usual, except in quantity; and now, dear girl, leave me to my labours.'

'With pleasure, François. But though I could kiss you for your noble conduct to this worthy old man, do look out for a little business too that will pay.'

'Pay!' said the young man in a voice which was slightly shriller than usual, because it was raised; 'never, sister. I know not why, but I do believe all my clients will be poor.'

And seizing pen and ink, he began to write with that energy and perseverance which were ever the characteristics of the man; nor did he cease until a ring at the door announced the return of his client, whose delight at the progress made was sincere and energetic. The sister, without delay or ceremony, at once served dinner, and down they sat to refresh exhausted nature. The old nobleman, long inured to disappointment, and to whom a gleam of sunshine was like the opening of a life-dungeon, was little hopeful, and even desponding; but the earnest discourse of his avocat somewhat roused him, and ere dinner was concluded, and when a quiet bottle of wine had warmed the old man, he began to see a path leading out of the desert in which for eight long years he had wandered.

'Monsieur le Marquis,' said the young man at length, 'I will now read my memoir.'

The client bowed his head to listen, with ears more charmed than those of lovers waiting the first fond avowal of returned affection. The lawyer read. His production, though slightly tinged with collegiate pedantry, with that half-learned Greek and Latin lore that made bastard Roman of the French of the last century, was vigorous, and, above all, audacious; and seven years before the Revolution, he made use of many of those arguments which afterwards brought it about. The rich and powerful family which held the property was most unsparingly handled: no epithet which indignation and generous hate of wrong could invent was spared.

'And you will print and sign your name to this?' said the client with a doubtful shake of his head.

'Why not?' replied the other dryly.

'Then my case is won, for it will reach the throne. As for you, young man, I need not promise you my support when reinstated: you will not require it.'

Not quite three months after this interview, the Marquis de Liancourt Chateaupret took possession of the whole of his property, the oppressors were disgraced at court, and the young lawyer found business crowd upon him sufficiently rapid to warrant the prophecy of his first client.

More than eleven years had passed, and a far different scene presented itself. Paris was at the same time the head-quarters of an army and the highest tribunal of justice, legislative and executive. Without, Europe was in arms against the Revolution, which made superhuman exertions to defend itself. Its laws ordained that every French citizen was permanently in requisition for the army, and that an extraordinary quantity of arms should be made. The young men were sent to the army, the married men were employed in transporting and preparing materials of war, women made clothes, and attended to the hospitals, children made lint, the old men roused others to enthusiasm by harangues in the public places. Palaces were turned into barracks, and churches into warehouses. All horses were placed at the disposition of government, and in fact every measure taken by the terrible Committee which governed France to repel the invader. To punish the treacherous, the inimical, the indifferent, the suspected, the fearful guillotine was at work day and night, while a mass of prisons were filled by those denounced to the vengeance of the laws.

It was early morning at the Luxembourg—one of the many prisons of the gloomy Reign of Terror—that era when, for causes not to be inquired into here, the air was thick with blood, when the atmosphere seemed crimson, and when grass grew in all the rich quarters of the city. The mass of prisoners—aristocrats, Federalists, Girondists, Brissotins, Fayetteuses, and others congregated together in this palace-made prison—were dispersed in knots, conversing or reading the public prints. In one corner were a batch about to appear before the revolutionary tribunal, in whose pale faces there could be traced a ray of satisfaction at the prospect of being removed by death from wearisome confinement; others, whose fate was less near, spoke carelessly of the events of the day, criticised the leading men of the hour, or expressed their hope of the triumph of this or that party—cautiously, because no one knew but that his neighbour was a spy placed in the prison by Hebert or Marat to seek the discovery of plots.

Apart from the rest was a group of touching interest.

On a rude bench, in a dark and gloomy corner, sat an old man, very old and very feeble. He was seventy, and his spare gray hairs seemed to remove all idea of his having been capable of conspiring against the Republic. And yet he was a secret agent of the exiled Bourbons, and had been caught in the act of organising a rising against the Convention. In those days, when death was the penalty of falling for those in power, there could be no shadow of hope for this old man. He was guilty of conspiring against the government, and had he succeeded in his end, would have led all who then ruled to the scaffold. He complained not, for as he would feebly say, 'It was they or I: had I gained, they had fallen. Victory is with them: they are right to use it.'

While none hoped, all pitied and sorrowed for that gray-headed old man; but none more seriously and more effectually than the young and lovely widow of a general officer, who had been convicted of secreting a treasonable correspondence. No sooner did she see how weak and exhausted the aged prisoner was, than forgetting herself, she piously devoted her whole thoughts to one who reminded her of happy hours, of soft and gentle memories, of the delightful and sunny period of existence, when she knew no other care than to see to a beloved and invalid parent's wants. She brought to him his food, assisted him in his walks about the common hall, read to him from the terrible chronicles of the day, and more than all besides, talked to him of a dear and only child long lost to him, but whose face was ever fresh before him, as when in baby prattle it called him father.

'But I will be your child,' she would say. 'Once out of this gloomy prison, we will fly to the country; and till war ceases to desolate the land, and infuriate and demoralise the people, we will live in secret retire-

ment: and think you that you have refound your daughter—in me, my good, good father.'

'Amelie,' would the old man reply, 'we shall never leave this place but to ride in the fatal *charrette*. I am a conspirator against the Republic—its enemy. I am in its power: I must die.'

'No, no!' cried Amelie, on the day in question with a shudder, which plainly told how little confidence she had in her own words: 'never will they slay you!'

'Child, child! the men who govern France sit on the summit of a fearful volcano: whoever seeks to hurl them down, and fails, must perish. I am a dead man. You, child,' he added, fondly gazing on her lovely face, 'you may—nay, will escape.'

'I have no trace of hope,' said she mournfully.

'The Citoyen Liancourt!' thundered a hoarse voice.

The pair raised their heads, and saw six men, whose huge cutlasses, vast tricoloured cockades, loose coats, coarse hats and shoes, with shining muskets, showed them to be some of the *sans culotte* national guard. Near them stood the jailer.

'Here,' replied the old man, rising and advancing, leaning on the arm of his fair and trembling aid.

'Prepare for a removal, citoyen,' said the chief of the band roughly, but without brutality.

'Without my child?' exclaimed the old man, clinging to his supporter, and calling her by the name she had adopted.

'Faith of a republican!' said the chief, observing his feeble aspect; 'the *Citoyen-Representant*'—here he glanced at a paper—'said nothing of a daughter; but that can be easily corrected. En route.'

The old man pressed fondly the arm of Amelie, who, too accustomed to the rapid and dramatic course of events in those days, felt no surprise at her sudden departure; and though she left behind her worldly wealth, in a small box of clothes, made no observation. Though carriages were generally abolished as signs of aristocracy, yet a vehicle stood at the door—one of those used by the leading men of the Committee of Public Safety to return home in after late debates at the Convention—and into this the old man and his devoted child of adoption entered. The *sans culotte* guard mounted their horses, and the cortège moved slowly towards the Seine.

'I hope we are not to be taken to the horrid Conciergerie?' said Amelie shuddering.

'Heaven only knows!' said the old man: 'let us be thankful we are not separated.'

With these words all conversation ceased, both gazing out curiously at the streets of Paris, to which they had been many months strangers. Presently they started, for they were crossing the bridge which led to the Place de la Révolution, and a sudden turn of the carriage made both close their eyes. The guillotine *en permanence* had struck them to stone. Next minute they were sobbing on each other's bosom. Escaping thus the knots of idlers, and the degrading spectacle of the ferocious women called the 'furies of the guillotine,' who lurked round in waiting for prey to torture and insult, they roused themselves when, having crossed the Rue de la République (now Rue Royale*), they halted before a house of mean appearance in the Rue St Honoré.

Both gazed curiously at what they expected to be their new prison; but ere they could examine much, two or three fanatical and sombre-looking men had rushed forward and opened the carriage door. The chief of the *sans culottes* made a sign to them to descend, which Amelie did with alacrity to assist the old man. This done, they passed through a carpenter's yard, where lay huge piles of timber, entered a little court, and then ascending a stair, were ushered into a large apartment. It was a bedroom and study both. On the bed lay maps, papers, open books; on the table a

huge mass of ugly scrawled manuscript and of English newspapers, which the occupant of the room was eagerly devouring, while every now and then he muttered to himself impatiently, 'Pitt! always Pitt, and George, and me—my armies, my troops, my resources! Miserable libellers—humph!'

The man raised his head, and the lawyer and his first client were once more in presence.

'Citoyen Robespierre!' cried the old man.

'Citoyen Liancourt!' replied the dictator of France with a smile—'sit down. What sayest thou to breakfasting with me again? My sister will serve us as usual.'

The old man sank into a chair, overwhelmed with emotion.

'Citoyen!' said Robespierre, after causing Amelie to be seated, 'I have not, thou seest, forgotten my first client, and my last; for I was last night thy advocate for two hours before the Committee. St Just said thou wast a traitor; and so thou art: but surely I may for once offend my colleague by saving even one guilty against his country!'

'Against the Republic!' stammered the old man, scarcely recovered from his surprise.

'Which is thy country and mine just now,' said the deputy of Arras dryly. 'But let us not dispute. We differ in opinion; thou servest one master, I another; both hard to serve, and thankless; but in serving thine thou hast forfeited thy life!'

'Which you are about to save?'

'I am, my old, my first client,' said Robespierre sadly. 'That was a happy day, Citoyen Liancourt—a happy day: I had not then the fate of thirty millions of men on my head, and all Europe leagued against me. Ah! my friend, little dost thou know the thankless office so many envy me. I neither rest nor sleep—I am no more myself—I am weary,' and he sipped as usual some camomile tea: 'but in revolution one can but advance—or die.'

'You are far from that, citoyen,' put in the still wondering *ci-devant* marquis.

'I know not. The fearful torrent rolls on apace, and must be stopped.'

'Men say not wrongly then,' cried the royalist, 'when they think you wish to stay this fearful tide?'

'To will and to do is different,' said the tottering dictator. 'Just now it is in my power to save thee: no man knows how soon I may be the weaker of the two. Let us talk of thy safety and of that of thy friend.'

Robespierre then explained that he had provided a passport for the Citoyen Scipio Mentor, *en mission* for the frontier, to which he now added, without asking a single question, the name of his daughter. This, signed as it was by himself, with a few assignats, would enable the old man, he said, to gain the frontier, and there end his days in peace.

'And now, my good old friend, farewell! We are embarked on different roads. Thou art for the old, I for the new. Thorny is my path, and difficult, and severely shall I be judged; but,' and he took the hand of the old man, 'let me have the satisfaction of knowing that amongst those who do not wholly condemn me is my first client.'

'My saviour, and that of my child!' replied the aged royalist fervently, 'fear not my blame. I will do you justice at least. It is not for me to judge your acts and motives.'

'And now, my friends, once more farewell! There wait without ambassadors, deputations, proconsuls, supplicants, the whole crowd that wait on power, and I must meet them. We shall never meet again! Think of me, for the few hours I have to live, not too ill.'

And Robespierre, after pressing the hands of both, led them to a side-door, where his faithful sister awaited them with breakfast. This meal, gratefully accepted and despatched, the old man and his child went out into the gloomy streets. Though several times stopped and questioned, the signature of the great Jacobin was

* The very day I write, the street has retaken the name of 'Rue de la République.'

like a talisman, and both reached in a few weeks a small and obscure town in Belgium, where, for the sake of the ultimate destination of his property, the ex-marquis induced his companion to become his wife. Nursed by her tender and affectionate care, he lived many years, and died in peace and quiet, in the enjoyment of a small income which he had saved from the wreck.

A few months after leaving Paris, the old man and his young wife received intelligence of the fall and death of Maximilian Robespierre. Both wept; for neither could forget that to one, justly or unjustly the object of execration, they owed the prolongation of their lives. Amelie, when again a widow, returned to France, and came into possession, ultimately, both of her own and her husband's property. To her exertions it was due that, at the Restoration, the poor sister of Robespierre received a pension from government; and thus had she ever reason to bless the memory of the poor old man who was her brother's first client.

AËRATED WATERS.

Among the important branches of our manufacturing industry at first called into existence by the luxury, and perpetuated by the necessity of men, we may assign a high rank to the manufacture of aerated waters. Although a large amount of labour and capital is thus employed, but little is known to the generality of readers of the processes employed in supplying the tables of the wealthy or the sick with these pleasant and often valuable beverages. We believe, therefore, that a sketch of the history and method of preparing such waters will be read with some degree of interest.

As an article of luxury, and still more as a branch of commerce, the manufacture of aerated waters is of very recent origin. Waters aerated by some natural processes in the crust of the earth have been celebrated and valued from time immemorial, and have proved an unintermitting source of wealth and health to the possessors and visitors of the localities in which they were discovered. Springs of water saturated with carbonic acid, and having an agreeably acidulous taste, very refreshing in the heat of summer, abound in many parts of Germany. In the electorate of Hesse-Darmstadt and the Eissel, these pleasant springs are found in great numbers, and supply the inhabitants with a valuable and inexpensive carbonated water. In many such cases, the continual process of decay going on in beds of wood-coal beneath the soil, appears to be the source of the carbonic acid: as the water bubbles up, it meets with the gas, and dissolves it, then makes its appearance at the surface as a sparkling fountain, impregnated to a very considerable amount with this gas. Carbonic acid springs also exist in volcanic districts, where the earth no longer glows with its wonted fires, yet preserving a dull heat, sends up incessant streams of the gas through the superincumbent soil. Towards the end of the last century, chemists began to inquire whether they could not imitate this agreeable natural production. Dr Priestley, the celebrated philosopher, appears to have been the earliest experimenter upon the subject, and particularly notices the brisk and agreeable flavour of artificially-prepared water holding carbonic acid in solution. Subsequently, the well-known Mr Nooth turned his attention to the subject, and after a little time, produced a highly-charged effervescent carbonated water, which came into great esteem. His apparatus consisted of three or more glass vessels, placed one above another, and each communicating with the one below and the one above. The uppermost was provided with a strong glass stopper, accurately fitted. The lowest was also provided with a second neck, well stopped, through which the materials for generating the gas were

passed. Into the two upper vessels water was put, so as to half fill them; into the lower, fragments of pure marble and some dilute hydrochloric acid. The acid, acting upon the marble, decomposed it, and caused the evolution of its carbonic acid gas; which, unable to escape in any other direction, rose through a valve in the neck of this vessel, and bubbled through the water in the one above, and again in the one above that. After this process had continued for a certain time, the water was drawn off, and was found to possess all the agreeable qualities of the natural waters, and in a superior degree. This was an elegant imitation of the process which we have mentioned as actually taking place in nature. But it occupied much time; and though the product was a palatable beverage, it was not sufficiently so for the improving taste of aerated water-drinkers. Mr Pepys and another gentleman thought to improve upon this apparatus by another on a somewhat similar principle, in which the water was made to pass again and again through a vessel containing a high charge of carbonic acid. But this method was also abandoned in its turn.

A London manufacturer, who was now rising into eminence, appears to have been the first to have caught the idea of effecting the impregnation of water by mechanical agency; and the aerated water thus produced surpassed all others in pungency and in its charge of gas. The process, however, was kept a rigid secret. Mr Pepys says—'The first apparatus in which condensing pumps were used openly I saw at an apothecary's in the city, who did not claim the original invention, as it had been suggested to him by several of his chemical friends.' The most complete instrument in the year 1800 was one devised by Mr Pepys, which, with but one important omission, contains all the parts of the modern engines. This machine consisted of a force-pump, gasometer, reservoir, bottling-tap, &c., and was long used by several houses now engaged in the trade. The liquid at first prepared was simply water highly charged with carbonic acid gas, or carbonated water. But it was soon found that a small addition of alkali improved the beverage, and also made it a valuable remedial agent. Carbonate of soda therefore was added, with a successful result; and the important aerated water so well known as soda-water thus originated. As it is the most agreeable of the alkaline beverages, it has retained its position; but not without competitors, for potash-water was soon afterwards introduced, subsequently magnesia-water, and more recently lime-water, under the poetical title of Carrara-Water. None of these, however, can be compared with good, genuine soda-water, as all possess in too strong a degree either a soapy or an earthy flavour. They have therefore come to be considered rather as members of the dispensatory, and as medicinal remedies, than as luxuries of the table. One great deficiency in the apparatus up to the period last mentioned was, the absence of any means of agitating the water so as to expose it thoroughly to the gas. If any one had entered a soda-water manufactory fifteen or twenty years ago, he would have seen the first rude attempts at accomplishing this object. Copper cylinders of great strength, bound with iron, were used as reservoirs for the charge of gas and water, and made to revolve generally by steam power on an axle fitted to the centre, in order that there might be a thorough intermixture of the materials. After whirling about for some time, the cylinder was carried to the bottling place, and its contents drawn off. This method was both imperfect and terribly wasteful, as a strong charge of gas was always left when the water had been drawn off, and this was allowed to blow off into the air! Without, however, dwelling at greater length upon the gradually-improving method of manufacturing aerated waters, we may proceed at once to describe the manufacture as it is now carried on on the large scale, and with all the modern improvements.

The manufactory to which we have had access is probably one of the most extensive in the provinces; and with several advantages accruing from its site, com-

vinces all the most perfect methods now in use for the preparation of these largely-consumed fluids. It is situated on the banks of the river Clwyd, in the little town of Ruthin, deeply embosomed in the vale so well known to Welsh tourists as the Vale of Clwyd. Its supply of water, which is so essential a portion of the manufacture, is probably unrivalled. This appears due to the fact of the geological basis of the district being the red sandstone. The water of the river percolates directly through a thick bed of this rock, becoming thus perfectly filtered before it is drawn for the use of the manufactory. Probably no water contains so minute a portion of mineral impurities, and upon this seems to depend the success of the manufactory. Passing by the engine-room and bottle-washing machinery, in which is an ingenious contrivance whereby the bottles to be washed fill themselves in the proper manner with water, the soda-water mechanism is arranged in a separate portion of the manufactory. A compact machine, something like the large model of a beam steam-engine, is at work at a rapid rate before us. On one side are the driving pulleys and fly-wheel, in the centre a polished reservoir of bell-metal, and at the further end a solid metallic plunger, rapidly moving to and fro in the perpendicular direction. This is the force-pump of the apparatus; and it is so arranged, that no extraneous matters of any kind can become mixed with the fluid. At the opposite end of the machine is a copper vessel, plated in the interior, which holds a graduated supply of the alkaline water, from thence drawn by the pump, and sent into the reservoir. This vessel is itself supplied by a pipe proceeding from an immense tank of slate in another part of the manufactory. Near the pump two pipes converge; one comes from the vessel just mentioned, the other proceeds directly from a very large gas-holder of copper, also out of sight; at this point two regulating indices are placed, on which is engraved 'Open,' 'Shut,' with a number of intermediate degrees. By this means the supply of water and of gas is conveniently adjusted, according to the degree to which it is required to charge the fluid. An arrangement of cog-wheels drives with great rapidity a spindle, which revolves inside the spherical reservoir, and thus agitates and mingles inseparably the gas and water.

From this part of the machine the now perfectly aerated fluid descends by a strong pipe to the bottling engine. At the top of this reservoir is a safety-valve, heavily loaded; and to insure the perfect saturation of the water with the gas, this valve is kept by the pressure within just on the lift, and not unfrequently blows off with considerable noise. The bottling of a fluid thus highly charged with elastic gas is, as may well be imagined, an operation of no common difficulty. In the greater number of manufactories it is still done by hand: the cork, hastily thrust in, is struck down into the bottle with a wooden mallet, greatly to the risk of the bottler and the bottle; while it has also this disadvantage, that the hand is unable to resist a pressure of more than three or four atmospheres, and hence the cork resists all efforts to drive it down until a large part of the charge has escaped. All these objections are obviated by the ingenious machine called the bottling engine. This is fixed in an upright position, at a little distance from the machine in which the fluid is prepared; and its supply is derived, as has been said, from a strong pipe connected with the reservoir. There is a sort of treadle, worked by the foot, having a wooden cup which receives the bottom of the bottle; the neck of the bottle is then placed inside a hollow collar of bell-metal, at the upper end of which the cork is put down from above, and in the side are holes connected with the pipe conveying the fluid. Above, there is a plunger, intended to force the cork down, worked by a powerful lever in the bottler's hand. The tap is turned, the fluid rushes in and fills the bottle, and the lever is forcibly dragged down, bringing the metallic plunger with it, and burying the cork in the neck of the bottle. It is then quickly removed, taken by the hand of an assistant just behind, who straps it down with tinned iron wire, when it is again delivered to another, who wires it in the opposite direction, and thus the captive cork is held firmly down.

The rapidity with which all this is effected can scarcely be believed. An expert bottler can often bottle off *two thousand five hundred bottles* as his day's work! The loss by breakage is frequently great—that is to say, where the maker is really honest, and charges his bottles with their full complement of gas; where this is not the case, it is very trifling. At the manufactory in question, many dozens of bottles are thus lost every day, although the glass of such bottles is from one quarter to occasionally half an inch in thickness. In order, therefore, to keep up the supply of bottles alone, a large amount of capital is sunk every year; and the floating capital represented by the thousands of bottles dispersed about in different parts of the country is very large indeed. After the bottles have been secured in the manner thus described, they are despatched to the labeller, who affixes the name of the article and that of the maker: they are then sent to the packing-room, where they are carefully put up in hampers, and sent off by the manufacturer's wagons to all parts of the country.

The apparatus for producing the carbonic acid gas, in this manufactory, is placed in an out-building. Most of our readers are probably familiar with the fact, that the addition of diluted sulphuric acid to chalk produces an effervescence, which is owing to the escape of carbonic acid gas, while the chalk becomes a sulphate instead of a carbonate of lime. These are the agents employed in this manufactory. The chalk is first mixed in a large reservoir with water to the consistence of cream, and then poured into a great leaden retort. To this is attached a leaden bottle, containing sulphuric acid; and a gas pipe, with a stopcock, conveys the gas resulting from the mixture of these substances through water into a large gas-holder, from whence the pump of the engine draws it for the use of the machine. By its side is the capacious tank for the alkaline liquor, capable of holding many hundred gallons; and a small pipe from it feeds the machine, as we have before seen. The engine which washes the bottles, and makes the soda-water and other aerated waters, has also to pump from the deep well the large daily quantity of water consumed, and supply-pipes are conveniently arranged to the several tanks and cisterns in this part of the building. We have not by us at this moment the statistics of the annual consumption of chalk, or 'whiting,' as it is called, and sulphuric acid, but we remember it was something very large—many tons of the one, and carboys of the other. Indeed, the consumption of these articles in the manufactory is so large as to have an effect upon the sulphur and 'whiting' trades. The principal sources of the chalk are the white walls of England—the extensive chalk cliffs on our south-eastern shores.

Although we have only described the manufacture of soda-water in this brief sketch, it may be taken as a tolerably accurate account of the mode of preparing every other aerated water, the principal differences lying in the differing nature of the fluids employed. Dr Ure, who has paid much attention to this, as to every other department of our arts and manufactures, engaged in an elaborate analysis of a number of samples of soda-water; and publishing his results in the 'Pharmaceutical Journal,' makes the very startling announcement, that by far the greater portion contained either no carbonate of soda at all, or at most about *one grain* in each bottle! And it is a well-known fact to medical men, that most of the so-called soda-water is merely water impregnated with carbonic acid. The reason appears to be, that the addition of the alkali to the water is costly in two respects—in the price of a sufficiently pure article, and in the larger quantity of gas the alkaline water absorbs. The best makers, however, are faithful to their reputation, and in their soda-water ten or fifteen grains of the alkali will always be found in a form the most agreeable of all for its administration. Dr Ure gives also some curious facts upon the average quantity of gas: in inferior soda-water it was very variable, but in the best, each bottle contained on the average 12,000 grain measures of gas, mixed in 4000 of water. Some experiments made by another gentleman, exhibit the amount of gas in the best London soda-

water at twenty-eight to thirty ounces; and in that of the manufactory in question, probably in consequence of the purity of the water, the charge was found to be thirty-two ounces of gas in each bottle. At the ordinary atmospheric pressure, water takes up its own volume of the gas; and these results show, that under the influence of a pressure equal to many atmospheres, it absorbs in addition two volumes more. Too much reliance, however, must not be placed on these results, in consideration of the frequent loss of gas by leakage.

The only other aerated water of any repute is the oxygenated water. An ingenious gentleman, noticing the volubility of laughing-gas in water, and believing that a remedial agent of great value might be thus prepared, took out a patent for the article. For some time it was in great repute; but, although we have made diligent inquiries after it, in consequence of its value as a medicinal fluid, the manufacture appears now either to have been discontinued, or to be of a very limited extent. The gas was procured by heating the salt known as the nitrate of ammonia; and was then made by a process similar to that described above. The liquid had an agreeable sweetish taste, and sparkled like ordinary waters. If the Liebigian theory of the causes of several very common disorders is correct, the constant drinking of this water, thus supplying a large amount of oxygen to the system, is much to be recommended. In the account published of its effects some years ago, it was stated that several persons had derived the most marked benefit from its use. The expense of the preparation is probably the chief obstacle to its large adoption; the cost of the nitrate of ammonia being many times greater than the gas-producing materials employed in the other manufacture. It is perhaps hardly necessary to state that this gas is not oxygen itself, but an oxide of nitrogen, or nitrous oxide.

There are some mechanical ingenuities connected with our subject, which may be appropriately mentioned in bringing it to a conclusion. The early ligatures to tie down the corks were string; but this was quickly abandoned, in consequence of the pressure against the cork bursting the string. Wire was then used, and has been since most generally employed, of various kinds—copper, iron, tinned, and galvanised. Tinned wire is now beginning to be employed; and in a large manufactory, the consumption of wire alone will probably amount to some tons in the course of a year. We were lately shown an ingenious contrivance for this end. A hole was made in the neck of the bottle, and a metal pin thrust through the cork, so as to make its escape impossible. Another plan consists of a little plate with a couple of wire straps; this is slipped into the cork, and the straps embrace firmly the neck of the bottle. An elegant instrument, principally for metropolitan use, has been lately introduced in London, consisting of an earthen vase of artistic design, charged with carbonated waters, which are drawn in the required quantity by a clever mechanical tap at the top. The name of this instrument is the Syphon Vase. It forms an ornamental addition to the dinner-table; but from difficulties connected with the re-charging, it is principally adapted for local use. A number of machines have been from time to time proposed for domestic use, of greater or lesser ingenuity; but that general proposition, applicable to so large a variety of subjects, obtains here also, that where the article is of large consumption, it is always best and cheapest to procure it of those who devote themselves to its exclusive manufacture. We suspect if there were invented a domestic tallow-candle-making machine, putting aside the excise difficulties, the most economical plan would be found to be to purchase the article ready-made.

It has long been a whim of ours, and we mention it because it may probably attract the notice of some one who has opportunities for practically making the attempt, that the elastic force of the carbonic acid generated in this manufacture might be economically applied, on the expansive principle of the steam-engine, to drive the machinery used in the manufacture. The gas might be generated in a powerful receiver, then be conducted into a kind of receptacle or boiler, from which it might

proceed, drive a small engine, and finally escape into the ordinary gas-holder to be used for the machine. If any one should think it worth his while to make the trial, we beg to present him with the idea gratis, although we are not over-sanguine as to a successful result.

AUTOBIOGRAPHY OF A WORKING MAN.

Most readers of newspapers must be acquainted with certain articles contributed to them during the progress of the free-trade movement, with the signature of *One who has whistled at the plough*. This person proves to be the same Alexander Somerville who created a sensation during the latter days of the reform movement (summer of 1832) as a private in the Scots Greys, who had been flogged indirectly for writing a letter to a newspaper, in which he expressed his belief that his fellow-soldiers would not support the Duke of Wellington in an effort to resist the national will as declared by the House of Commons. The child of a mason's labourer in Haddingtonshire, Somerville obtained some tincture of learning at a parish school. While, in boyhood and early manhood, working at laborious employments for small gains, he educated himself by reading and haunting the company of such intelligent persons as fell in his way. The final result is, his being a favourite and well-paid writer in the newspapers, and his publishing, at seven-and-thirty, a narrative of his life, possessing no small value as a report to one department of society of the feelings and workings which go on in another, that other being at present the subject of a problem charged with the gravest interest to present and prospective humanity.

The volume opens with sketches of the cottage economy of Scotland, under the care of a decent industrious couple, influenced by the religious feelings of our country, and inspired with the anxious wish to bring up their children in a creditable manner. With all the drawbacks of a somewhat stern discipline, the system has a certain moral beauty, for which, it is to be feared, there is no counterpart in much of the modern life of better-paid working people, whether in town or country. Somerville partook of the usual hardships of his class—was half-starved in dear years, tyrannised over by the farmers' children at school, and thrashed by the master for resisting; sent to tend cattle while yet a child, and persecuted by superstitious fears, against which no one could instruct him to defend himself. He was not yet a man when, like Burns, he had to do a man's work, breaking stones on the road, cutting drains, and acting as a sawyer—all of them most laborious employments. While thus engaged, intellectual pleasures came to him; and he details the delightful novelty of his sensations on first reading the Ayrshire poet, on seeing a play, and perusing a newspaper. By and by he had to move about the country in search of work, generally with companions. One of the difficulties attending this kind of life was to avoid joining his friends in their potations of whisky, to which he had no sort of liking, while, moreover, he desired to be able to return home with a good suit of clothes purchased by his savings. It is distressing to hear of the sacrifices made by Somerville's associates to the demon of liquor. On pay-days, he says, it was hardly possible for the most abstemious and resolute to escape spending money on liquor; meaning, we presume, that those who were most inclined, tempted and compelled those least so, to join them in their orgies. It was in the crisis of the accession of the Whig ministry in 1830, when the outcry for political reforms arose, that the following circumstances took place, strongly illustrating a point which we lately brought before the reader:—

'A number of masons were hewing the blocks of stone, and each hewer had a labourer allotted to him to do the rougher work upon the stone with a short pick, technically to "scutch" it. The masons were intolerable tyrants to their labourers. I was in the quarry cutting the blocks from the rock when the tide was out: and when the tide was in, I went and scutched with some of the hewers, chiefly with my friend Alick. One day, when we had been reading in the newspapers a great deal about the

tyranny of the Tories, and the tyranny of the aristocracy in general, and some of the hewers had been, as usual, wordy and loud in denouncing all tyrants, and exclaiming "Down with them for ever!" one of them took up a long wooden straight-edge and struck a labourer with the sharp edge of it over the shoulders. Throwing down my pick, I turned round and told him that, so long as I was about the works, I would not see a labourer struck in that manner without questioning the mason's pretended right to domineer over labourers. "You exclaim against tyranny," I continued, "and you yourselves are tyrants, if anybody is." The hewer answered that I had no business to interfere; that he had not struck me. "No," said I, "or you would have been in the sea by this time. But I have seen labourers, who dared not speak for themselves, knocked about by you, and by many others; and by every mason about those works, I have seen labourers ordered to do things, and compelled to do them, which no working man should order another to do; far less have the power to compel him to do. And I tell you it shall not be done."

"The labourers gathered around me; the masons conferred together. One of them said, speaking for the rest, that he must put a stop to this; the privileges of masons were not to be questioned by labourers, and I must either submit to that reproof, or punishment which they thought fit to inflict, or leave the works; if not, they must all leave the works. The punishment hinted at was, to submit to be held over one of the blocks of stone face downward, the feet held down on one side, the head and arms held down on the other side, while the mason apprentices would whack the offenders with their leathern aprons knotted hard. I said that, so far from submitting to reproof or punishment, I would carry my opposition a great deal farther than I had done. They had all talked about parliamentary reform; we had all joined in the cry for reform, and denounced the exclusive privileges of the anti-reformers, but I would begin reform where we then stood. I would demand, and I then demanded, that if a hewer wanted his stone turned over, and called labourers together to do it, they should not put hands to it unless he assisted; that if a hewer struck a labourer at his work, none of the labourers should do anything thereafter, of any nature whatever, for that hewer. (The masons laughed.) "And farther," said I, "the masons shall not be entitled to the choice of any room they choose, if we go into a public-house to be paid, to the exclusion of the labourers; nor, if there be only one room in the house, shall the labourers be sent outside the door to give the room to the masons, as has been the case. In everything we shall be your equals, except in wages; that we have no right to expect." The masons, on hearing these conditions, set up a shout of derisive laughter. It was against the laws of their body to hear their privileges discussed by a labourer; they could not suffer it, they said, and I must instantly submit to punishment for my contumacy. I told them that I was a quarryman, and not a mason's labourer; that, as such, they had no power over me. They scouted this plea, and said that wherever masons were at work, they were superior, and their privileges were not to be questioned. I asked if the act of a mason striking a labourer with a rule was not to be questioned. They said, by their own body it might, upon a complaint from the labourer; but in this case the labourer was insolent to the mason, and the latter had a right to strike him. They demanded that I should at once cease to argue the question, and submit, before it was too late, to whatever punishment they chose to inflict. Upon hearing this, I put myself in a defensive attitude, and said, "Let me see who shall first lay hands on me!" No one approaching, I continued, "We have been reading in the newspaper discussions about reform, and have been told how much is to be gained by even one person sometimes making a resolute stand against oppressive power. We have only this day seen in the papers a warning to the aristocracy and the anti-reformers that another John Hampden may arise. Come on, he who dares! I shall be Hampden to the tyrannies of the masons!"

"None of them offered to lay hands on me; one said they had better let the affair rest where it was, as there would only be a fight about it, and several others assented; and so we resumed our work."

"Had it been in summer, when building was going on, they would have either dismissed me from the works, or have struck, and refused to work themselves. It was only about the end of January, and they could not afford to do more than threaten me."

Against such a specimen of 'man's inhumanity to man,' it is delightful to place the following anecdote of humble benevolence. Somerville, with some companions, arrived in Kelso in search of work on the eve of a hiring fair day:—"We could get no lodgings there, every place being filled with cattle-dealers and other strangers already arrived for to-morrow's fair. Thoroughly worn out, we lay down on the causeway of a narrow street where there seemed to be the least traffic, and the least danger of being run, ridden, or driven over in our sleep. Some of us were already asleep, when a weaver and his wife, opposite to whose humble cottage door we lay, came out and said they could not go to bed, nor rest if they were in bed, with the thought of fellow-creatures lying in the street. They had a large family of children, a small house, and were only poor persons, they said; still, if we would go inside, they would at least give us the shelter of a roof and a fire to sit by. We went in. The weaver and some of his children made a bed for themselves beneath the loom; his wife and the other children went to a bed in the loft, and four of us lay crossways on the bed which they had vacated in the kitchen. The other three stretched themselves on the clothes-chests and the chairs. In the morning, one of us went out and bought tea, sugar, and bread for breakfast, while the kind woman got us water and a tub to bathe our blistered feet; and the weaver gave his shaving razors to those who needed shaving, and took his other razor, which was past shaving, and pared such of our feet as had bruises; and took a darning needle and worsted and drew it through the blisters, leaving a worsted thread in the blisters—the best possible cure for them. When we had breakfasted, and were all bathed, doctored, and refreshed, the good woman, her heart overflowing with motherly generosity, said, "No, we must not offer to pay her; no, we must not speak of thanks even; we were no doubt some mother's bairns; she had bairns of her own, and the wide world was before them yet; it would be an awfu' thought for her to think it possible that they might ever be without a roof to sleep under. Oh no; we must not speak about paying her; she had done nothing, nor the guidman had done nothing but their duty, their Christian duty, whilk was incumbent on them to perform to their fellow-creatures."

In the Merse (Berwickshire), our author found there were some curious distinctions between the rural labouring class and those of his native district, though they are divided only by a rivulet. The people of the former province work much the hardest, but are perpetually changing masters, and they can never furnish forth their marriageable daughters so well as the Lothian labourers. "As indicating some peculiarities of the maids of the Merse and of Lothian, I may report what their respective admirers may be heard saying of them. He from the Lothian side of the small rivulet before-mentioned is told that he cannot get a lass for his wife in Lothian who can bake a scone." He rejoins that he cannot get one who can "fill muck at the midden, and drive the muck carts, as they do in the Merse: they never," he says, "gar women drive carts in Loudan." And he says the truth. The Merse man next takes up what he calls the Loudan tone: he says, "In Loudan the women are so slow at their work, and have such a long tone to their words, that when they speak, they stop their work until the tone comes to an end, and in that time a Merse woman would work round about them." The apologist of the merits and manners of the lasses of Lothian cannot suffer this to be the last word; he retorts smartly

and without a very long tone, that "if the women o' Loudan dinna cut their words so short as they do i' the Merse, neither do they cut their claes so short: gin [if] the lasses o' the Merse would eik the Loudan tone to their short goons, their short goons would set them the better, and maybe the lads would like them naething the waur."

"Should these disputants be shearing with the Merse women within hearing, as is most probable, the "Loudan louts," as they are ill-naturedly called, may reckon on a *kemp* [contention] which shall stretch their skin before they get to the end of the field. Their best agility and strength, and their worst and fastest work, cannot cope with these women as shearers. The men have not yet been born who are their matches at a *kemp*. They will be first at the land end, if they should slash the corn down, and trample over it without laying it in the bands for the bandsters to tie in sheaves. They must, and will reach the land end first. The Lothian shearers, let them do their best, must only follow. When the latter do reach the land end, they will be taunted by the others, and told that they must "sup another bow o' meal afore they kemp again wi' the lasses o' the Merse, or cast up to them about their short goons!"

After many changes of masters and of employment, Somerville enlisted in the Scots Greys, and the spring of 1832 found him a recruit of one-and-twenty in the Birmingham barracks. The men caught the contagion of the time, and some joined the political union. Somerville, from a sense of propriety, abstained from doing so, though as keen a reformer as any. At the crisis when it was apprehended that the Duke of Wellington was going to undertake an anti-reforming government, our hero wrote his famous letter—a proceeding, we humbly think, much to be condemned, but not so much so as that of his officers in punishing it. There seems no room to doubt that the first consequence of his authorship being suspected, was to force him into an act of disobedience. He was put upon an unruly horse, without stirrups, and obliged to ride it in the school, till, seeing that he must be thrown, he dismounted, and refused to resume his lessons. Placed under arrest for trial, he was brought before the commanding officer, Major Wyndham, who taxed him with a treasonous act in writing the letter, and told him he would repent of it. There was a hurried and irregular court-martial—a condemnation of course, and the infliction of a hundred lashes, which Somerville here describes in most vivid terms. As must be remembered, he became a martyr of the newspapers and clubs, and the case being noticed in the House of Commons, a court of inquiry sat upon it, and condemned the conduct of Major Wyndham as 'injudicious.' Somerville was enabled by the public beneficence to obtain his discharge, but he suffered much in delicacy of spirit, from the efforts of vulgar-minded partisans to parade him and his sufferings before the public. His value as a subject for the newspapers comes out in a strong and somewhat amusing light in these memoirs.

Much credit seems due to him for his refraining from all retaliatory measures against his oppressors. While remaining steadfast in his political prepossessions, he does not seem to have been provoked by his experience of the wantonness of power into any general feeling of bitterness against either classes or persons. The trades'-unionists of 1833-4, expecting to find in him one fit for treasons, stratagems, and spoils, endeavoured to inveigle him into a conspiracy which it now appears had been formed, with objects not greatly different from the famous Gunpowder Plot; but he not only shrunk from the part assigned to him with horror, but gave the government such warning as enabled them to defeat the plan. He afterwards served in the Spanish legion, where he attained the rank of sergeant-major. On returning penniless, he wrote a narrative of that distressing episode—an extraordinary work, from the circumstances under which its composition was commenced. 'I might,' says the author, 'have found friends, and have got assistance in Glasgow. I would not, in the dirty regimentals I was clothed in, go to any person who had before known me. The person to whom

I offered my certificate of six months' gratuity for a quire of writing paper, and pen and ink, to begin to write my narrative of the legion, would give nothing for the worthless certificate, but made me a present of several quires of writing paper. I walked out of Glasgow, three or four miles up the Clyde, got into a field of beans nearly ripe, crept out of sight into the middle of the field; lay there three days and nights, writing the first chapters of my "Narrative," and living on the beans. I sent the farmer a copy of the work afterwards, as payment for what I had eaten.'

The style of this book is quiet, simple, and perspicuous. The writer tells much against himself; yet the general impression left is in his favour. In the humblest situations, he seems to apply himself to the duties before him with diligence; he resists debasing pleasures, for the sake of something better; he is content to be a loser, rather than fall the least grade in integrity. Many of his remarks on the position and interests of working men might be listened to with advantage by that class, and there are passages in the volume calculated to be of wider utility: for instance, the following:—"An old cavalry soldier in Edinburgh gave me some words of counsel, to be observed in the stable and the barrack-room. I refer to them now, because I have found them, or similar rules, useful elsewhere than in a stable or barrack-room. One was, to observe when the soldier's wife, who might be in the same room with me, was about to go for water to the pump, or was in want of water, I was to take her pail and say, "Nay, mistress, let me go to the pump for you," and go instantly. Another rule of conduct was to anticipate a comrade who might require his clothes brushed, and rise and do it for him before he had time to ask the favour. And so in the stable, if I had charge of a comrade's horse in his absence, he on guard perhaps, to be as kind to his horse as to my own; and at any time, if I had nothing to do myself, to put forward my hand and help some one who had something to do. The same readiness to oblige may be practised in a workshop, in a literary office, or any other office, and is as necessary to be observed there as in a stable. But I fear that if there be not a natural inclination to be obliging, the desire of acquiring the good-will of associates will fail to make one always agreeable. Almost all men, probably all, who have risen above the social level upon which they were born, or who have created new branches of trade, or have been inventors, or have made discoveries, have been men who were ever ready to put forth their hands to help a companion in his work, or to try to do something more than what was allotted for them to do by their employers. The apprentice, or journeyman, or other person who will not do more than is allotted to him, because he is not bound to do it, and who is continually drawing a line to define what he calls his rights, with his fellow-workmen, or with his employer, or, if in the army, with his comrades, and the non-commissioned officers immediately over him, is sure to remain where he is, or sink to a lower level. He is not destined to be a successful master, tradesman; to be a discoverer in science, an inventor in mechanics, a propounder of new philosophy, nor a promoter of the world's advancement, and certainly not of his own.

'It may to some appear like vanity in me to write what I now do, but I should not give my life truly if I omitted it. When filling a cart with manure at the farm dunghill, I never stopped work because my side of the cart might be heaped up before the other side, at which was another man; I pushed over what I had heaped up to help him, as doubtless he did to help me when I was last and he first. When I have filled my column, or columns of a newspaper, or sheet of a magazine, with the literature for which I was to be paid, I have never stopped if the subject required more elucidation, or the paper or magazine more matter, because there was no contract for more payment, or no likelihood of there being more. When I have lived in a barrack-room, I have stopped my own work, and have taken the baby from a soldier's wife when she had work to do, and nursed it; or have gone for water for her, or have cleaned another man's

accoutrements, though it was no part of my duty to do so. When I have been engaged in political literature, and travelling for a newspaper, I have not hesitated to travel many miles out of my road to ascertain a local fact, or to pursue a subject into its minutest particulars, if it appeared that the public were unacquainted with the facts of the subject; and this at times when I had work to do which was much more pleasant and profitable. When I have needed employment, I have accepted it at whatever wages I could obtain—at plough, in farm drain, in stone quarry, at breaking stones for roads, at wood-cutting, in a sawpit, as a civilian, or as a soldier. I have in London cleaned out a stable, and groomed a cabman's horse for a sixpence, and been thankful to the cabman for the sixpence. I have subsequently tried literature, have done as much writing for ten shillings as I have readily obtained—been sought after, and offered—ten guineas for. But had I not been content to begin at the beginning, and accept shillings, I would not have risen to guineas.*

FIVE DAYS IN THE WILDERNESS OF NEW BRUNSWICK.*

On the morning of the 5th of last November we were encamped on the line of survey in the Tobique district, about five miles from the Little Gulquac. At eight o'clock, the party having struck the tents, and got their several loads in readiness, commenced their day's march along the line, when I left them, as I usually did, for the purpose of examining the neighbouring country. I took a course to the westward for about half a mile, behind a small mount, from the top of which I was led to expect an excellent view of the surrounding country, as observations from it of distant mountain heights had already been made by the surveying party during the summer's operations. After making a few notes and sketches, I went to the top of the hill, where I remained for a short time similarly employed. I next descended, with the intention of regaining the line of survey, and joining the party. This, however, I found to be no such easy matter. The country in this neighbourhood has to an immense extent been laid waste by extensive fires, and the trees, and even the soil, in some places are so thoroughly burnt up, that there is not a vestige of vegetation to be seen; in others, the naked trunks of the trees are left standing, like the grim ghosts of a stately forest race, charred by fire, or blanched by the storm; or they are tossed by the whirlwind into the most frightful heaps of confusion. These are termed 'windfalls,' and form some of the most formidable barriers to the progress of the traveller of the wilderness.

The surveyed line through this section of country, owing to the facts above stated, was merely traced out with small stakes, placed at long intervals, which, having become dark and discoloured, could scarcely now be distinguished from the surrounding dead-wood. I was not then in the least disconcerted at failing to find the line, but continued to advance in the direction which I knew it to take, stopping from time to time to make sketches and observations as before. As it was now getting late in the afternoon, and I felt confident I had gone quite as far as the party were likely to have advanced in their day's march, I again made an effort to discover them, by traversing the country both to the right and left for a considerable distance, whooping as loud as I possibly could: but all in vain; I could neither hear nor see anything of them. Very little more than half a mile from where I stood I recognised a rocky height from which I had, the year before, made some observations, and immediately proceeded thither, in the hope of being able to discover from it the smoke of the camp. On reaching the summit, there stood the post which I had placed for my instrument exactly as I had left it a year

ago. I carefully scanned the face of the country round in every direction, but the anxiously-looked-for smoke was nowhere to be seen; and I was at last most reluctantly compelled to relinquish my hope of finding the party for that night at least.

Not knowing whether the surveyed line lay to my right or left, I resolved on taking the direction in which I thought there was least personal risk, and therefore lost no time in getting on a line which had been run by my directions the year before, along which I kept to the northward, as, in case I did not in the meantime cross either the other line or tracks of the party, I should have at least made some progress towards Campbell's, the nearest settlement on the Tobique. I continued to press forward without discovering the objects of my search. I had reached the Beaver Brook, a branch of the Wapaskihegan, when night overtook me, and it commenced to rain. It was now quite certain that for one night I must forego the comforts of food, fire, or shelter—having at the same time no doubt of my easily reaching Campbell's some time next day. My situation at that time, although but the commencement of my disaster, was one of no ordinary suffering. I had already undergone nearly twelve hours of the most harassing fatigue, without food or a moment's rest; and now, cold and wet, stood alone amid wind and rain, in a sterile and shelterless wilderness, and on a night so dark, that the very sky seemed black. What was to be done? To follow a course, and move forward in the dark, I knew was impossible. There were thirteen long hours until daylight, yet I dared not lie down to rest, for fear of perishing. I at length resolved to endeavour to follow the course of the Brook, in doing which, I had difficulties to surmount which would, I have no doubt, appear to many almost like impossibilities, even by daylight. Such a night of falls, wounds, bruises, scratchings, and fatigue, is, I confess, beyond my powers of description. On the morning of the 6th, I found I had got to within a short distance of the mouth of the Brook, which I crossed, intending to follow down the Wapaskihegan river, until I came to a lumber road I had travelled the year before, leading by Shea's Mountain to the Campbell settlement, on the Tobique river. The waters were now much swollen, so that I could only scramble along a very steep bank, thickly wooded with underwood and trees. I had gone some distance down, when, thinking that a little way back from the bank of the river I might probably find the travelling easier, I took that direction, and again found myself in a seemingly open country of burnt lands. The surrounding highlands were distinctly seen on all sides in the distance, and amongst the most conspicuous was Shea's Mountain, which led me to the resolution of taking a direct course for it, not dreaming of the formidable difficulties I should have to encounter on the way. I toiled on with determined perseverance through a dreadful combination of windfalls, marsh, lakes, streams, &c., so that another day was nearly spent before I had reached the mountain. I at length found the lumber road, and now considered myself safe, and my journey nearly at an end, being only four miles from the settlement; but I reckoned without my host. I followed the road for a short distance, until I came to an old lumber camp and road leading off to the left, which I examined, and unfortunately rejected, as it appeared to pass on a different side of the mountain to that which I knew the proper road to take. From that moment I continued to go astray.

On travelling a little way further, I came to a second old lumber camp, where the road again branched into two. A snow-storm had now commenced, and night was once more fast approaching. On going about a mile and a half down one of the roads, I did not like its appearance, and returning, followed the other, which I found equally unsatisfactory, as it did not much resemble the road I had travelled during the summer of last year. I, however, endeavoured to console myself with the pro-

* The hero of these adventures is Mr John Grant, employed in the Halifax and Quebec railway exploration survey.

bability of the difference in its appearance being caused by its covering of snow.

I continued to travel for some miles through a low marshy ground, until I became quite convinced of my being in a strange part of the country; when I returned, with the intention, if possible, of regaining the old lumber camp before dark, and passing the night in it; but the night came upon me so suddenly, that I had only time to go a little way to the right, where the ground was higher, and less swampy, and take up my quarters in the shelter of some low bushes, a few branches of which I threw on the ground before lying down. I need scarcely say I was wet, cold, hungry, and much fatigued, having now continued to walk without interruption for upwards of thirty-five hours. On lying down, I got into rather a distressing sort of slumber, from which I in a short time awoke, with much pain in my limbs and back, and stiff with cold. I got up and walked about, until once more overcome with fatigue, when I again lay down, to endure a repetition of my sufferings; and in this way passed a dreadful night of about thirteen hours. On the morning of the 7th, as soon as it was sufficiently clear, I left my wretched couch, shivering with cold, and by no means refreshed after my fatigue. I was nevertheless in tolerable spirits, not considering myself lost, and feeling assured that within a few hours at least I should once more be in comfortable quarters.

The cravings of hunger were now becoming excessive, and not even a berry was to be seen with which I might allay them. The weather throughout had been, and still continued dark, and the only compass then in my possession I had long considered as useless; I, however, took off the glass, with the hope of repairing it, but my hands had become so benumbed with cold, that the needle slipped from my fingers amongst the long grass, and I was unable, after the most diligent search, to recover it. I now found that both the roads leading from the lumber camp again united, and resolved to continue the one I had been following, under the impression that it must bring me out somewhere on the Tobique. For a considerable distance it traversed a low marshy district, where I found it very difficult to follow, being sometimes up to my knees in water. After a march of several hours, I came to a *timber brow*, on a river which appeared of doubtful size for the Tobique: but as of course my route lay down the stream, I, under a gradual mustering of doubts and fears, continued my journey in that direction.

I had felt, without at that moment comprehending them, very evident symptoms of approaching weakness. I frequently heard the sound of voices quite distinctly, and stopped to listen. I whooped! but not a sound in reply. The stream murmured on its bed, the wind rustled amongst the leaves, or whistled through the long grass; but that was all: everything else was silent as the grave. In a short time after, a most extraordinary illusion occurred. My attention was first attracted by distinctly hearing a tune whistled in the direction of the river; and on looking round, I saw through the trees an Indian with two squaws and a little boy. My joy at the sight may be readily conceived: their canoe, I thought, could not be far off; and I already fancied myself seated in it, and quietly gliding down the river. I hallooed! but to my utter amazement, not the slightest notice was taken, or reply made. The Indian, with folded arms, leant against a tree, and still continued to whistle his tune with philosophic indifference. I approached, but they receded, and appeared to shun me; I became annoyed, and persisted, but in vain, in trying to attract their notice. The dreadful truth at length flashed upon my mind: it was really no more than an illusion, and one of the most perfect description. Melancholy forebodings arose. I turned away, retraced my steps, and endeavoured to think no more of it. I had turned my back upon the vision, but as I retreated, its accompaniment of ghostly music for some time continued to fall upon my unwilling ear like

a death knell. A sort of mirage next appeared to me to spread over the low grounds, so completely real in its effect, that frequently, when expecting to step over my boots in water, I found that I was treading upon long *dry grass*; to be convinced of the truth of which, I frequently felt with my hand. My first vision was undoubtedly the result of *delirium tremens*, brought on by exhaustion; but whether the latter arose from the same cause, or from real external phenomena, I cannot well determine.

I continued my toilsome journey along the alternately flat and tangled, or precipitous banks of the river, which, from being now swollen, left me no beach to travel on. I crossed a large brook, which, mistaking it for the Odell, led me to suppose myself but a very little way from the settlement (in reality, upwards of twelve miles off). I had not advanced a great way further, until I suddenly dropped down. Supposing I had merely tripped and fallen, I got up, and endeavoured to continue my march, but again staggered and fell. I got up a second time, and leaning against a tree, in the hope of recovering from what I at first imagined to be temporary indisposition, again made several fruitless attempts to walk, until at last the appalling fact forced itself upon me, that I had really lost my strength; and as any further exertions of my own were now impossible, my case was indeed hopeless, unless discovered by some of the party, who I had no doubt were by this time in search of me; or, what certainly did appear improbable, by some persons going up the stream to lumber. Under the circumstances, I thought it best to endeavour to regain the banks of the river; but owing to my weak and disabled condition, I could scarcely do more than drag myself along on my hands and knees, and was consequently overtaken by the night and a sharp frost. I took shelter behind the roots of a fallen tree, and pulled off my boots, for the purpose of pouring out the water, and repeding my feet as dry as I could make them, to prevent their being frozen; after which, from my feet being much swollen, I found it quite impossible to get them on again. I lay down, excessively fatigued and weak; yet other sensations of suffering, both mental and physical, kept me, through another dreary night of twelve or thirteen hours, in a state which some may possibly conceive, but which I must confess my inability to describe. There was a sharp frost during the night, against which my light jacket and trousers were but a poor protection. On the morning of the 8th, when it was sufficiently clear, I discovered that I was not more than a hundred yards from the bank of the river. On endeavouring to get up, I was at first unable, and found both my feet and hands frozen; the former, as far as my ankles, felt as perfectly hard and dead as if composed of stone. I succeeded, however, with a good deal of painful exertion, in gaining the bank of the river, where I sat as long as I was able with my feet in the water, for the purpose, if possible, of extracting the frost. The oiled canvas haversack in which I carried my sketching-case I filled with water, of which I drank freely. The dreadful gnawings of hunger had by this time rather subsided, and I felt inclined to rest. Before leaving the bank of the river, I laid hold of the tallest alder near, and drawing it down towards me, fastened my handkerchief to the top, and let it go. I also scrawled a few words on two slips of paper, describing my situation; and putting each into a piece of split stick, threw them into the stream. I next moved back a little way amongst the long grass and alders; and striving to be as calm and collected as my sufferings and weakness would allow, I addressed myself to an all-seeing and merciful Providence, and endeavoured to make my peace with Him, and place myself entirely at His disposal—feeling assured that whatever the issue might be, whether for time or eternity, it would undoubtedly be for the best. I trust I was not presumptuous, but I felt perfectly calm and resigned to my fate.

I lay down amongst the long wet grass, having placed

my papers under my head, and my haversack, with some water, near my side. My weakness seemed to favour the most extraordinary creations of the brain. I became surrounded, especially towards evening, with a distinct assemblage of grotesque and busy figures, with which, could I have seen them under different circumstances, I should have been highly amused. Yet do I believe them to have been a great relief from the utter loneliness that must otherwise have surrounded me, as it really required an effort to establish the truth of my being alone. I passed another long and dreary night; and from its being rather milder, had some little sleep, although of a distressing and disturbed nature, and not in the least refreshing. The morning of the 9th arrived, and I could then with difficulty support myself even on my knees. Still, after extraordinary exertions, I procured a fresh supply of water, and lay down—I thought most likely never to rise again. A violent burning sensation in the stomach had now come on. A few mouthfuls of water allayed it, but brought on violent spasms for five or ten minutes, after which I had, for a little while, comparative relief. In this state, gradually growing weaker, I continued until the morning of the 10th. During the night it rained in torrents, which, although in some respects inconvenient and disagreeable, had in a great measure drawn the frost from my feet and hands, which, as well as my face, had become very much swollen.

In the course of the morning I thought I heard the sound of voices. I raised my head a little from the ground—all I could now accomplish—and looking through the alders, I saw a party of men and some horses on the opposite side of the river, and scarcely a hundred yards distant from where I lay. My surprise and joy were of course excessive; yet I had of late seen so many phantoms, that I was quite at a loss whether to consider it a reality or not. When at length convinced, I discovered, alas! that both my strength and voice were so completely gone that I could neither make myself seen nor heard. All my exertions were unavailing; and my horror and disappointment may be readily conceived at seeing them depart again in the direction from which they had come. I had now given up all hope, and once more resigned myself to my apparently inevitable fate. Three hours had passed, when I again thought I heard the sound of horses' feet on the bed of the river. On looking up, I saw they had returned to the same spot. My efforts to make myself heard were once more renewed, and I at last succeeded in producing a howl so inhuman, as to be mistaken by them for that of a wolf; but on looking up the stream, they saw my handkerchief, which I had fastened to the alder, and knowing me to have been missing before they left the settlement, surmised the truth, and came at once to my assistance. I was taken into a cabin built at the stern of the tow-boat, in which there was a small stove. They there made a bed for me, and covered me with blankets and rugs. They made me a sort of pap with bread and sugar, which they offered, and also some potatoes. I declined their kind offering, but begged to have a little tea, which they gave me, and I went to sleep. The tow-boat had to continue her voyage some distance up the river with her freight, after which we returned, and got to Campbell's late in the afternoon, where I met with every kindness and attention. The house of Mr Campbell, to which I was brought, was but a very ordinary log-house, yet with all its simple homeliness I felt quite comfortable, seeing I was surrounded with the most perfect cleanliness; and the good dame was, from long experience, well skilled as to the case she had to deal with, at the same time saying mine was much the worst she had ever had under her care.

I have thus endeavoured to give an imperfect sketch of my wanderings during a period of more than five days and nights, without either food, fire, or shelter from the inclemency of the weather. My recovery has been rapid; although I at first suffered a great deal,

both from the returning circulation in my hands and feet, and after partaking of food. I was in a few days sufficiently well to be removed down to the mouth of the river Tobique, where I found my poor wife anxiously awaiting my arrival. I must, in conclusion, say that my wonderful escape ought at least to convince me that God is ever merciful to those who sincerely put their trust in Him.

THE INVALID SEA VOYAGE.

WHEN all other remedies fail, physicians recommend travelling, a sea voyage, or some other mode of change of air, locality, and habits; and such changes often produce wonderful effects on the system. Nor can this be well explained in theory. Physicians know not how it happens; they prescribe it empirically, and, as in many other cases, are guided by experience, not by reasoning. To invalids, there is something at first view in a sea voyage repulsive and uninviting; but if the arrangements and accommodation are at all tolerable, this feeling is soon got the better of. To pass from a comfortable home into a ship, appears at first unpleasant; but to pass from the crowded smoky atmosphere of the city to the pure, expansive, and quiet atmosphere of the ocean, will be found a relief and a pleasure. Let us see what is the difference of this atmosphere from the other, and then we will be better able to judge, especially in the case of a debilitated nervous person, one whose digestive organs are out of order, or worn, and whose chest, and breathing, and circulation are constant sources of anxiety and annoyance.

The sea air is pure and uncontaminated. It is of a soft equable temperature—lower than that of land often is, it is true, but not liable to such sudden changes—never dry and parched; and rarely, except under a tropic sun, hot and suffocating. It contains, in general, about an equable portion of moisture—not too much—never in excess, as is often the case on land, and never too little. The stratum of air next the sea is, on the whole, drier than that on a corresponding portion of land. This arises from certain laws of temperature and evaporation. Then its electric condition is much more uniform—a matter of more importance than is generally imagined. There are no epidemics, influenza, plagues, or anything of the kind experienced at sea. On the contrary, as soon as the fugitive and sufferer from such maladies finds himself fairly out into the ocean, all of them disappear. How seldom do we find the sailor, while at sea, affected with any of those maladies so common on land, and especially in cities! No one but an invalid can know or appreciate the comfort of a sea atmosphere, the increased ease of breathing, the renewed vigour and elasticity, the absence of palpitations, and the sound sleep which the monotonous dashing and the salutary motion of the wavy billows induce. To a landman, to be sure, the rolling motion at first is not so pleasant; but custom soon reconciles him to this; and in certain cases this very motion becomes highly beneficial.

The sea air, we have said, is pure and bracing. Instead of the noxious particles and effluvia constantly floating about in the city atmosphere, and the miasma not unfrequent in the rural plains and valleys, the sea air is impregnated with a slight proportion of saline matters—common salt, iodine, bromine, and some others. Now, may not these act chemically on the system? And hence, probably, the renewed and increased appetite, the improved condition of the secretions, all essential in a state of perfect health. But a sea voyage is monotonous? Not at all—especially not to the invalid. It may be monotonous to a fox-hunter, to the owner of bullocks, to the cavalry officer, to the view-hunter, ever on the wing, sitting about for novelty; but to the invalid, indisposed to much bodily exertion,

inclined, or obliged to live by rule, and to walk, talk, and move by square and measure, where can there be such a place as a snug vessel, where the meals, the watches, the deck scrubbing, and every sort of work and occupation is regulated by the strictest regard to time? To the invalid, who, after one meal, spends half the interval in thinking about and anticipating the next, what so delightful as dinner served up to a very minute, and cookery, too, though simple, yet of the very best description of its kind? A roasted potato never tasted anywhere so well as on board a ship, perhaps the master-work of some jet black and shining-faced negro, born with an instinct for cooking yams! And what can be more palatable than pea-soup—the boast of all cabin-boys? Then there is a novelty about all naval operations, which months of keen observation cannot fully satiate. The evolutions on deck afford a never-failing source of investigation; the sails, and ropes, and yards, and pulleys, and gay ensigns and pendants; the human population—from the captain down to the black cook and the urchin cabin-boy, with all their peculiar actions, sayings, and looks—afford exhaustless studies to the inquisitive novice. Then the economy of the cabin—its furnishings, lockers, berths, have all to be scrutinised—its storm-windows, lights, fireplaces, mirrors—all so different from anything on shore; and when this is exhausted, an exploration of the fore-castle, the hold, and every corner and cranny of your temporary prison-house, will all tend to supplement your enjoyments.

A ship has been called a prison; but where is thought so free and expansive as when looking around you from the deck in some calm and glowing evening, or in the still hour of mid-day? It is true your actual sphere of vision is circumscribed; for looking on the level sea from a ship's deck, your circle does not embrace above two or three miles in extent; yet how vast and boundless a flight into infinite space does not fancy suggest to your mind, and what calm and elevating trains of thought may you not pursue, as hours on hours glide on unheeded? But the view is monotonous, it is again affirmed, and unvarying in its elements; for there is nothing but the same sea and sky, the one touching, or appearing to terminate, in the other. But so it is in your country-house, in the middle of that flat plain, or even in your ornamental cottage, placed in the most picturesque situation. All these become monotonous to the dull eye or the unidea'd mind. But at sea, have you not all the varieties, as well as on shore, of cloud and sunshine—of glorious sunrise and splendid sunset? Have you not the calm—the breeze grateful as a cooling breath, and as an essential sweller of your sails—the stiff breeze curling the green swelling waves into white foam, and the storm raising sky and ocean into awful sublimity? People say you cannot read at sea or write much; but this is a mistake. Where are there greater letter-scribblers, journal-writers, or even book-makers, than sailors? But for an invalid much reading or writing is not necessary, rather injurious. Let him divert his mind with pleasing variety, calm musings, and easy observation. The great deep, far from any shore, does not indeed present many animated objects. It is singularly destitute of vegetation, and of the larger kinds of animated life; but the ocean waters, even at such remote distances from land, still swarm with minute beings—the shining cilia, the sailing phœlias, and innumerable animalcules, that will display themselves before the microscopic lens. Then, too, may the sailor invalid become an astronomer—watch the stars, the moon, and the satellites, and learn how these all serve to guide the mariner's track so surely through the vast ocean. The daily reckoning and ship's progress, the taking of the sun's altitude, the approach to land, indicated by the floating sea-weeds and the white-winged sea-birds, that joyfully take their flights around—all these are sources of gentle and salutary excitement. The very stepping on shore, feeling again the tread of earth, seeing the trees and green

fields, the houses and crowds of bustling citizens, with the consciousness of renewed health and vigour, are all circumstances so pleasing to the invalid, that he will look back on his ship with love and thankfulness.

GENEROSITY OF AUTHORS.

THE sight of a learned man in want made even the satirist Boileau so uneasy, that he could not forbear lending him money. The prudently economical Addison for some time freely opened his purse to remove the difficulties of his friend Steele, produced by foolish extravagance. There does not seem to exist the slightest confirmation of the story of Addison having put an execution into Steele's house to recover a sum of money which he owed him. In a letter to his wife, written in August 1708, Steele mentions that he has 'paid Mr Addison the whole one thousand pounds;' and at a later period he says, 'Mr Addison's money you will have to-morrow noon.' It is related of Goldsmith, whose heart adored humanity, that he enlarged his list of pensioners as his finances increased, and that his charity extended even to his last guinea. Once having visited a poor woman, whose sickness he plainly perceived was caused by an empty cupboard, he sent her a pill-box containing ten guineas, bearing the inscription, 'To be taken as occasion may require.' He was frequently deceived by impostors, who worked upon his generous sympathies with fabricated tales of most lamentable misfortunes; but no feeling mind will harshly censure him for his unsuspecting credulity and overflowing humanity. In his unbounded philanthropy he exclaims—

'Yet oft a sigh prevails, and sorrows fall,
To see the hoard of human bliss so small;
And oft I wish, amidst the scene, to find
Some spot to real happiness consigned;
Where my worn soul, each wandering hope at rest,
May gather bliss to see my fellows blest.'

Gray, in one of his letters, written in 1761, says that Mr Benjamin Stillingfleet, the writer on natural history and agriculture, 'lives in a garret in the winter, that he may support some near relations who depend upon him. He is always employed, always cheerful, and is an honest worthy man.' Voltaire was ever happy to assist persons in distress, especially young persons of talent struggling with difficulty. The granddaughter of the great dramatic poet Peter Corneille, being destitute of money and friends, attracted the sympathy of Voltaire, who supported her for three years; and having by that time finished her education, he married her to a gentleman. Voltaire not only gave her a marriage-portion, but he wrote, and published by subscription, for her benefit, a commentary on the works of her celebrated grandfather, whereby she obtained in a short time fifty thousand livres. The king of France subscribed eight thousand livres, and some foreign princes followed his example: the Duke de Choiseul, the Duchess de Grammont, and Madame de Pompadour, subscribed considerable sums. M. De la Barde, the king's banker, took several copies, and greatly increased the sale of the work by his zeal in promoting the benevolent intentions of Voltaire. To an unfortunate bookseller at Colmar, whose affairs were much deranged, Voltaire made a present of his 'Annals of the Empire,' and also lent five thousand livres. Two brothers, respectable citizens of Geneva, having invited him to print his productions there, he complied, and made a present of his works to them in the same handsome manner as he had done to the bookseller at Colmar.

Shenstone was one day walking through his romantic retreat, in company with his Delia (Miss Wilmot), when a rather unpleasant intruder rushed out of a thicket, and presenting a pistol to his breast, demanded his money. Delia fainted, while Shenstone quietly surrendered his purse, anxious to see the back of the man as quickly as possible. The robber seized the money, threw his pistol into the water, and immediately decamped. Shenstone ordered his footboy to pursue him at a distance, and observe whither he went. In a short time the lad returned, and informed his master that, having traced

the man to his home, he peeped through the keyhole of the door, and saw him throw the purse to his wife, and then taking up two of his poor children, one on each knee, he said to them he had ruined his soul to keep them from starving, and immediately burst into a flood of tears. Having learned that he was a labourer, reputed honest and industrious, but oppressed by want and a large family, Shenstone went to his house, when the man, kneeling down at his feet, implored mercy. The poet not only forgave him, but provided him with employment as long as he lived.

When Lord Byron resided in the Albany, Piccadilly, a young lady, an unsuccessful poetess, who was friendless, and involved in difficulties through the misfortunes of her family, whose distressed state deeply preyed upon her mind, resolved, on the plea of authorship, to introduce herself to Byron, and solicit his subscription to her poems. From a perusal of his works, she concluded that he was of an amiable disposition, and much misunderstood by the world. His kind reception of her fully confirmed her opinion; for having simply stated her motive for coming to him, he in the most delicate manner prevented her from dwelling on any painful troubles, by immediately beginning some general conversation; in the course of which he wrote a draft, which he folded up and presented to her as his subscription. She did not of course look at the paper while in his presence, as his conversation was too delightful to be relinquished for a moment; but on her leaving him, she inspected it, when to her joy she found it was a draft on his banker for fifty pounds.

Roscoe humanely devoted the profits of his amusing 'Memoir of Richard Roberts' to the use of that singular, helpless, and half-witted person, well known in Liverpool from the extraordinary number of languages which he could read, self-taught. After the publication of Roscoe's work, the poor, and, till then, dirtily-clad linguist, might be seen properly clothed, with his portable library stuffed, as in former times, between his shirt and his skin, for he still disdained a fixed abode.

MINES OF NATURAL MANURE.

The 'Gardeners' Chronicle and Agricultural Gazette' announces the important fact, that beds of fossil phosphates—the most fertilising of manures—have been discovered in Surrey, along the lower edge of the chalk formation. Liebig has already predicted their existence in the following words: 'In the remains of an extinct animal world, England is to find the means of increasing her wealth in agricultural produce, as she has already found the great support of her manufacturing industry in fossil fuel.' The fulfilment of this prophecy is due to the exertions and researches of Mr J. M. Paine of Farnham. That gentleman having noticed that a certain portion of his estate, remarkable for the green tint of the soil, was exceedingly prolific, sent some of the earth to a chemist for analysis without any conclusive result, but afterwards forwarded to Professor Way a box of marl dug out of a pit sunk in the same sort of soil. This proved, on analysis, to possess great fertilising power, which was very materially increased when washed and selected. Out of the richest vein of one of the pits (says Mr Paine) we dug a mass weighing 32 lbs. This was thoroughly washed, and from it we obtained 14 lbs., or about 44 per cent., of clean hard fossil-like lumps of every size. The fossils contain sensible quantities of fluorine, but its proportion was not ascertained. Mr Paine has no doubt that similar strata of rich manure exist in equal, if not greater abundance in other parts of England. The vast importance of his discovery to agriculture need not be pointed out.—*Newspaper paragraph.*

THE FIRST OF MAY.

In Scotland, the observance of May morning seldom extends further than the bathing of faces in the tempting dew; but we learn that the young girls of a boarding-school in Dingwall, for the first time in the north, or at least in that ancient burgh, crowned their May-queen, danced round their Maypole, and observed the occasion with all due respect; the girls singing 'Flora, save the queen of May,' and kneeling by turns to present an offering of flowers, each emblematic of some tender wish.

THE FAR FAR EAST.

It was a dream of early years, the longest and the last,
And still it lingers bright and lone amid the dreary past;
When I was sick and sad at heart, and faint with grief and care,
It threw its radiant smile athwart the shadows of despair:
And still when falls the hour of gloom upon this wayward breast,
Unto the FAR FAR EAST I turn for solace and for rest.

I feel as if some former birth (as Indian sages tell)
Had given my migrant soul within these realms of light to dwell;
And now that, ever and anon, when vexed with strife and pain,
It struggles through the mists of time, and wanders home again:
For still in pious reverence to her I bow the knee,
As if indeed the FAR FAR EAST a mother were to me.

Sure 'tis the form I worshipped then which haunts my memory
now,

To mock with fairy light my dreams, and flush my pallid brow;
Sure 'tis the hand I then did grasp in friendship's holy strain,
For which this cold and selfish clime I search, and search in vain:
Alas! nor heart nor hand like these I meet where'er I rove,
And in the FAR FAR EAST lie hid man's faith and woman's love.

Oh for the morning's swiftest wings to bear me as I flee!
Oh for the mists of the waste, wild winds and moaning sea!
Oh to behold you western sun sink in his bloody grave,
And a new day-spring rise for me upon the desert wave!
Oh to throw off this coil of thought, and care, and grief, and pain,
And in the FAR FAR EAST to be a joyous child again!

L. R.

OUR WONDROUS ATMOSPHERE.

The atmosphere rises above us with its cathedral dome, arching towards the heaven, of which it is the most familiar synonyme and symbol. It floats around us like that grand object which the apostle John saw in his vision—'a sea of glass like unto crystal.' So massive is it, that when it begins to stir, it tosses about great ships like playthings, and sweeps cities and forests, like snowflakes, to destruction before it. And yet it is so mobile, that we have lived years in it before we can be persuaded that it exists at all, and the great bulk of mankind never realise the truth that they are bathed in an ocean of air. Its weight is so enormous, that iron shivers before it like glass; yet a soap-bell sails through it with impunity, and the tiniest insect waves it aside with its wing. It ministers lavishly to all the senses. We touch it not, but it touches us. Its warm south winds bring back colour to the pale face of the invalid; its cool west winds refresh the fevered brow, and make the blood mantle in our cheeks; even its north blasts brace into new vigour the hardened children of our rugged clime. The eye is indebted to it for all the magnificence of sunrise, the full brightness of mid-day, the chastened radiance of the gloaming, and the clouds that cradle near the setting-sun. But for it the rainbow would want its 'triumphal arch,' and the winds would not send their fleecy messengers on errands round the heavens. The cold ether would not shed its snow-feathers on the earth, nor would drops of dew gather on the flowers. The kindly rain would never fall, nor hail-storm nor fog diversify the face of the sky. Our naked globe would turn its tanned and unshadowed forehead to the sun, and one dreary, monotonous blaze of light and heat dazzle and burn up all things. Were there no atmosphere, the evening sun would in a moment set, and, without warning, plunge the earth in darkness. But the air keeps in her hand a sheaf of his rays, and lets them slip but slowly through her fingers; so that the shadows of evening gather by degrees, and the flowers have time to bow their heads; and each creature space to find a place of rest, and to nestle to repose. In the morning, the garish sun would at one bound burst from the bosom of night, and blaze above the horizon; but the air watches for his coming, and sends at first but one little ray to announce his approach, and then another, and by and by a handful, and so gently draws aside the curtain of night, and slowly lets the light fall on the face of the sleeping earth, till her eyelids open, and, like man, she goeth forth again to her labour till the evening.—*Quarterly Review.*

THE SKERRYVORE LIGHTHOUSE.

In the Atlantic Ocean, between the Western Islands of Scotland and the north of Ireland, there is a cluster of rocks, the tops of which only appear above high water, and which were formerly the cause of much perdition of shipping, as they lay in the track of vessels making for the Irish Channel and the Firth of Clyde, and there was no means of warning the mariner against their treacherous neighbourhood. The centre of the cluster, from which the whole took their name, was the Skerryvore [that is, Great Rock], which at high water presented a few masses of small superficies, rising about five feet above the waves, so that in stormy weather it was swept over by every surge. On this rock, twelve miles from the island of Tirree, which is the nearest land, it was resolved in 1834 to erect a lighthouse, and the duty of conducting the operations was confided to Mr Alan Stevenson, son and successor of the respectable engineer by whom the Bell-Rock Lighthouse had been erected about twenty-five years before. We have now Mr Stevenson's account of the work in an elegant and elaborate quarto, which can scarcely be more interesting to the members of his profession for its technical and scientific details, than to the general public for its narrative of an unusual class of dangers and difficulties cheerfully encountered in the cause of humanity, and overcome through the aid of carefulness and skill.

Most persons in common life must be quite unprepared to hear of the peculiar steps necessary to be taken in order to rear a pharos upon a rock in such a situation. First, it is difficult in any state of the tide to land upon the rock. It affords no shelter, no room for working; it is twelve miles from land, and even that land is only an inhospitable wilderness, remote by two or three days' sail from any place where the conveniences of civilised life can be commanded, or any mechanical operations are conducted. These circumstances rendered necessary such a series of preliminary arrangements as only could be accomplished by a liberal outlay of money, and an exertion of foresight and patience equally extraordinary. On reviewing the work after it was perfected, one is at a loss whether most to admire the resources which a wealthy state can bring to bear on such objects, or the heroism and fortitude of the men who devoted themselves to the business.

The first step was a survey of the rock, in itself a most difficult task, which Mr Stevenson did not complete till the summer of 1835. He had then to take soundings all round, for the sake of the vessels which were to be employed in carrying on the works. He had also to examine the rock geologically, in order to ascertain its soundness, and its capability of being worked for a foundation. It proved to be a gneiss of excessive hardness, and yet perforated in sea-caves which narrowed consider-

ably the workable ground. One of these terminated in a narrow spherical chamber, worked smooth by the tumbling of a few boulders, and having an aperture at top, through which came occasionally a jet of water twenty feet high, white as snow, and during sunshine, clothed in the hues of the rainbow. So smoothened was the whole exterior of the rock by the dash of the sea, that at one of their early landings the foreman of the masons described it as like 'climbing up the outside of a bottle.'

The second step was to plant a colony of works at Hynish, in the south angle of the island of Tirree. Here a piece of ground, fifteen acres in extent, was *fenced* from the Duke of Argyll for the permanent establishment connected with the intended lighthouse, while thirty acres more were leased for the purposes of a temporary workyard. 'For our works,' says Mr Stevenson, 'craftsmen of every sort were to be transported, houses were to be built for their reception, provisions and fuel were to be imported, and tools and implements of every kind were to be made.' A steam tender was also to be built for communications between the works and the rock. These operations were the work of 1836 and 1837, during which time the quarrying of materials was also going on at Hynish, where, however, they ultimately found the stone to be unsuitable for the proposed tower. It was not till the beginning of the summer of 1838 that they were ready to effect any operations on the rock itself. The first duty there was to rear a wooden barrack for the accommodation of the men; a work of the most critical nature, on account of the violence of the sea-drift, to which it must necessarily be exposed. 'In providing,' says Mr Stevenson, 'the means of efficiently carrying on so many complicated operations in a situation so difficult and remote, it is impossible, even with the greatest foresight, to avoid omissions; while delay of a most injurious kind may result from very trivial wants. Even the omission of a handful of sand, or a piece of clay, might effectually stop for a season the progress of plans in the maturing of which hundreds of pounds had been expended. Accordingly, although I had bestowed all the forethought which I could give to the various details of the preparation for the season (of which I found it absolutely indispensable to be personally aware, even to the extent of the cooking dishes), new wants were continually springing up, and new delays occasioned, so that it was not until the evening of the 23d of June that I could embark at Tobermory in the *Pharos* Lighthouse Tender, commanded by Mr Thomas Macurich, with all the requisites on board for commencing the season's operations.' It was not till five days after that Mr Stevenson could effect a landing on the rock, where he spent an afternoon in marking off sites for the proposed barrack, the smith's forge, and other articles required for the

work. He had then to return to Greenock for the remainder of the necessary implements, and he did not land again on Skerryvore till the 7th of August. The disembarkation of various heavy articles, and the carrying of them over the slippery rocks, were operations of extreme difficulty, attended by considerable discomfort; yet, adds Mr Stevenson, 'it invariably happened that, in spite of all the fatigue and privation attending a day's work on this unsheltered rock, the landmen were for the most part sorry to exchange it for the ship, which rolled so heavily, as to leave few free from sea-sickness, and to deprive most of the workmen of sleep at night, even after their unusually great exertions during the day.'

While proceeding with the landing of materials, the party suffered a gale on the night of the 8th of August, and with great difficulty got through the environing shoals to their retreat at Hynish. 'A more anxious night I never spent; there being upwards of thirty people on board, with the prospect, during several hours, of striking every minute.' Returning four days after, they had six days of good weather, which enabled them to fasten up the strong pyramid of beams 44 feet high, on a base about 34 feet in diameter, on which the barrack was to be perched. While thus engaged, 'the economy of our life was somewhat singular. We landed at four o'clock every morning to commence work, and generally breakfasted on the rock at eight, at which time the boat arrived with large pitchers of tea, bags of biscuit, and *canteens* of beef. Breakfast was despatched in half an hour, and work resumed, till about two o'clock, which hour brought the dinner, differing in its materials from breakfast only in the addition of a thick potage of vegetables, and the substitution of beer for tea. Dinner occupied no longer time than breakfast, and, like it, was succeeded by another season of toil, which lasted until eight, and sometimes till nine o'clock, when it was so dark, that we could scarcely scramble to the boats, and were often glad to avail ourselves of all the assistance we could obtain from an occasional flash of a lantern, and from following the voices. Once on the deck of the little tender, and the boats hoisted in, the materials of breakfast were again produced under the name of supper; but the heaving of the vessel damped the animation which attended the meals on the rock, and destroyed the appetite of the men, who, with few exceptions, were so little *sea-worthy*, as to prefer messing on the rock even during rain, to facing the closeness of the forecabin. As I generally retired to the cabin to write up my notes, when that was practicable, and to wait the arrival of my own refection, I was sometimes considerably amused by the regularity with which the men chose their mess-masters, and the desire which some displayed for the important duties of carving and distributing the rations. Even the short time that could be snatched from the half-hour's interval at dinner was generally devoted to a nap; and the amount of hard labour and long exposure to the sun, which could hardly be reckoned at less than sixteen hours a-day, prevented much conversation over supper; yet in many the love of controversy is so deeply rooted, that I have often, from my small cabin, overheard the political topics of the day, with regard to church and state, very gravely discussed on deck over a pipe of tobacco.' Bad weather recurring, they were obliged to run for shelter once more, and they did not re-land on the rock till the 31st of August, and only then for a few hours. They had only occasional landings for nearly a fortnight afterwards, and at last they were obliged to quit work for the season on the 11th of September, leaving things in a less finished state than was desirable. 'Before leaving the rock,' says Mr Stevenson, 'I climbed to the top of the pyramid, from which I now, for the first time, got a bird's-eye view of the various shoals which the stormy state of the sea so well dis-

closed; and my elevation above the rock itself decreased the apparent elevation of the rugged ledge so much, that it seemed to me as if each successive wave must sweep right over its surface, and carry us all before it into the wide Atlantic. So loud was the roaring of the wind among the timbers of the barrack, and so hoarse the clamour of the waves, that I could not hear the voices of the men below; and I with difficulty occasionally caught the sharp tinkle of the hammers on the rock. When I looked back upon the works of the season, upon our difficulties, and, I must add, dangers, and the small result of our exertions—for we had only been 165-hours at work on the rock between the 7th August and the 11th September—I could see that in good truth there were many difficulties before us; but there was also much cause for thankfulness in the many escapes we had made.'

Mr Stevenson left the works with a pleasing anxiety from what had already been effected; but to his great distress, a storm which occurred early in November carried away all but a fragment of the strong work which they had erected. The smith's forge at the same time disappeared, and the anvil was carried eight yards from its proper situation. So unexpected was the fate of the pyramid, that it was concluded that some portion of a wreck had dashed against it, and thus assisted in its destruction.

Another evil of this time was the failure of the quarries at Hynish, and the necessity of bringing stones from a superior quarry at Ross, in the Isle of Mull. The stone thus obtained was a granite of great durability, nearly as hard and dense as the gneiss of Tirree. It gives a striking idea of the difficulties of the whole undertaking, that the blocks could not be directly transported from Mull to Skerryvore; they had to be landed at Hynish, and re-shipped for the rock at certain happy junctures, when the weather was such as to permit a landing of them at Skerryvore. While remaining at Hynish, they were fully dressed with all requisite exactness, and laid down course after course on a flat surface, so as to ascertain their suitability for taking their designed places in the building. Among the preliminaries at Hynish hitherto not spoken of, was the construction of a low-water pier for the embarkation of the materials.

In the course of the working season of 1839 (a working season at the rock lasted only from May till September), a second pyramid was formed on somewhat securer principles, and the barrack fitted upon it. The latter was a wooden box divided into three storeys, of which the two lowest were penetrated by the beams of the pyramid. The first served as a kitchen, the second was divided into two cabins, one of which was for Stevenson's use, the other for the foreman of the works; the third storey was for the thirty men who were to be engaged in the rearing of the lighthouse. While this work was proceeding, the space for the foundation of the tower was in the course of being excavated—a work of immense difficulty, owing to the hardness of the rock, and which was not completed till next summer. During the season of 1839, they also prepared a sort of wharf for the debarkation of the stores for the building. It was done by blasting; and the mines were sprung during high tide by a galvanic battery, 'to the great amazement and even terror of the native boatmen, who were obviously much puzzled to trace the mysterious link which connected the drawing of a string, at the distance of about one hundred yards, with a low murmur like distant thunder, and a sudden commotion of water in the landing-place, which boiled up, and then belched forth a dense cloud of smoke; nor was their surprise lessened when they saw that it had been followed by a large rent in the rock.' During August they had a severe storm, which destroyed their moorings, and carried off the smith's forge; but on the whole, this was a more successful season than the last; and when they returned in April 1840, everything was found in good order, even to the biscuit which they had left in the

barrack for any shipwrecked crew which might have chanced to be thrown on the rock.

In May, the party took up their residence in the barrack, and the time formerly consumed in embarking and disembarking being thus spared, they were able to advance somewhat faster with their labours. It was, however, an uncomfortable habitation, and in bad weather, life on Skerryvore was far from agreeable. According to Mr Stevenson—'During the first month we suffered much from the flooding of our apartments with water, at times when heavy sprays lashed the walls of the barrack with great violence, and also during rainy weather; and in northerly gales we had much difficulty in keeping ourselves warm. On one occasion, also, we were fourteen days without communication with the shore or the steamer; and during the greater part of that time we saw nothing but white fields of foam as far as the eye could reach, and heard nothing but the whistling of the wind and the thunder of the waves, which were at times so loud, as to make it almost impossible to hear any one speak. For several days the seas rose so high, as to prevent our attempting to go down to the rock; and the cold and comfortless nature of our abode reduced all hands to the necessity of seeking warmth in bed, where (rising only to our meals) we generally spent the greater part of the day, listening to the howling of the winds and the beating of the waves, which occasionally made the house tremble in a startling manner. Such a scene, with the ruins of the former barrack not twenty yards from us, was calculated only to inspire the most desponding anticipations; and I well remember the undefined sense of dread that flashed across my mind on being awakened one night by a heavy sea, which struck the barrack, and made my cot or hammock swing inwards from the wall, and was immediately followed by a cry of terror from the men in the apartment above me, most of whom, startled by the sound and tremor, immediately sprang from their berths to the floor, impressed with the idea that the whole fabric had been washed into the sea. The alarm, however, was very short, and the solemn pause which succeeded the cry was soon followed by words of reassurance and congratulation. Towards the end of the fourteen days I began to grow very uneasy, as our provisions were drawing to a close; and when we were at length justified, by the state of the sea on the rock, in making the signal to those on shore (at the hour fixed for pointing the telescope at Hynish on the barrack) that a landing could be effected, we had not more than twenty-four hours' provision on the rock, so that when the steamer came in sight she was hailed by all hands with the greatest joy.'

He says elsewhere—'The economy of our life on the rock was strange enough. At half-past three in the morning we were called, and at four the work commenced, continuing till eight, when half an hour was given for breakfast; after which it was carried on till two, when another half-hour was given for dinner; and the work was again resumed, and continued till seven, eight, and even nine o'clock, when anything urgent was in hand. Supper was then produced, and eaten with more leisure and comfort in the cool of the evening. Such protracted exertion produced a continual drowsiness, and almost every one who sat down fell fast asleep. I have myself repeatedly fallen asleep in the middle of breakfast or dinner; and have not unfrequently awakened, pen in hand, with a half-written word on the paper! Yet life on the Skerryvore rock was by no means destitute of its peculiar pleasures. The grandeur of the ocean's rage, the deep murmur of the waves, the hoarse cry of the sea-birds, which wheeled continually over us, especially at our meals, the low moaning of the wind, or the gorgeous brightness of a glassy sea and a cloudless sky, and the solemn stillness of a deep blue vault, studded with stars, or cheered by the splendours of the full moon, were the phases of external things that often arrested our thoughts in a situation where, with all the bustle that sometimes prevailed, there was

necessarily so much time for reflection. Those changes, together with the continual succession of hopes and fears connected with the important work in which we were engaged, and the oft-recurring calls for advice or direction, as well as occasional hours devoted to reading and correspondence, and the pleasures of news from home, were more than sufficient to reconcile me to, nay, to make me really enjoy, an uninterrupted residence, on one occasion, of not less than five weeks on that desert rock.'

The masonry of the tower was commenced on the 4th of July 1840, and conducted with great spirit for the remainder of the season, at the close of which it had been carried to the height of 8 feet 2 inches. Recommened in the ensuing May, the solid part, forming the basis, was completed on the 8th July. During the early part of this season 'the weather was intensely cold, with showers of sleet, and heavier showers of spray, which dashed round us in all directions, to the great discomfort of the poor masons, whose apartments did not admit of a large wardrobe, while they had not the benefit of much room for drying their clothes at the small *cobose* or cooking-stove in the barrack. For days together, also, the men were left without building materials, owing to the impossibility of landing them, or, what was worse, without the power of building what we had on hand, in consequence of the violence of the winds. During such times we often felt much anxiety about the safety of the stones which we had piled on the rock ready for being built; and it took no small trouble, by the occasional application of the crane, to save them from being swept into the sea by the surf. Nothing struck me more than the illusive effect produced on the mind by the great waves which rolled past the rock. The rapidity of their movements, and the noise which accompanied their passage through the gullies and rents of the rugged reef, seemed to give them the appearance of being much larger than they really were; and even when viewed from the tower, after it had risen to the height of thirty feet, they seemed, on approaching the rock, to be on the eve of washing right over the top of the building, and sweeping all before them into the sea. It was a long time before, by continually watching the waves, and comparing their apparent height with the results of their impact on the rock, we were enabled to correct our notions of their magnitude, so as to mark the approach of their crested curling heads with composure; and some of the party never became sufficiently familiarised with those visitors to avoid suddenly looking round when the rush of a breaker was heard behind them, or recoiling a few paces when they saw its towering crest apparently about to burst in a torrent over their heads. It was only after a long residence on the rock, and continual experimental observation, that I acquired confidence to approach within a few feet of the point which I expected the breakers to reach.' At the close of the season in August, when the pile was gauged, it was found to preserve the diameter due to the height to the 16th of an inch, and the height exceeded the contemplated dimension by only half an inch!

On the 21st July 1842, the masonry was completed, being a tower of 137 feet 11 inches, curving inwards from a basis of 42 feet, and containing nine apartments over each other, for the accommodation of the establishment by which the light was to be sustained. It contains 58,580 cubic feet, and 4308 tons of material. From the exactness with which the stones were dressed, it had never been necessary to redress any deviation from the outline of the building to an extent materially exceeding an eighth of an inch. Not a joint in the structure was ever found in the slightest degree to give way. The lantern was now put up, and thus the whole structure was completed before the close of the third season: but it was not till February 1844 that, the whole furnishings being complete, and the keepers introduced to reside in the building, the light was for the first time exhibited. It is an apparatus of eight annular lenses

revolving round a lamp of four concentric wicks, and producing a bright blaze every minute, visible to the distance of eighteen miles.*

So ended the construction of the Skerryvore lighthouse—a work which we hope will long remain as a monument of the power of man over the physical elements by which he is surrounded. Notwithstanding all the difficulties and perils attending the work, and though several scores of men were engaged in it for several years, it was accomplished without any serious accident. It is a work which could only have been carried into execution in a time of great material wealth and great scientific skill like the present. There are some shortsighted persons who condemn capital as a thing opposed to the interests of the industrious classes; and there are others who, with less in their circumstances or education to excuse them, speak disparagingly of our age as a mechanical one. Let the one inform us how, without great stores of wealth, any country could have afforded to spend eighty-nine thousand pounds on a lighthouse, in order, among other objects, to save poor sailors from destruction. Let the others tell us if there are many moral spectacles more sublime or ennobling than that of natural science turned to such purposes, and working out its ends amongst such difficulties. The age of chivalry is not past: only, the heroes of our age are men who, instead of pursuing whims or wreaking out sanguinary feelings, endure great toils, in order to bring the laws established by the Almighty to work for the extension of human happiness, and the diminution of human suffering.

SHANEEN OF THE HILL.

DID any of our readers ever go mushroom-gathering? It is pleasant sport; at least so we thought long ago in what is called life's holiday—though the time we are supposed to be learning our lessons—when with basket in hand, or with hat or bonnet as a substitute, we would ramble away, on some summer's eve, over the breezy hills, diligently looking out for the snowy little tufts, that showed their heads here and there through grass so green, and so short, from the cropping of the sheep, that even the tiniest foot could find nothing to sink in. What sharp reconnoitring glances were cast around; what demure unconscious looks lest another should spy our prize before we could reach it; or if, perchance, more than one keen pair of little eyes did light on the same object at the same instant, what headlong racing, what rolling on the close slippery grass, what active bounding—one, two, three, and away—over the prostrate bodies; what gratitude to the lazy good-natured one, always the last, that saved his credit so well by stopping to pick up the fallen; and then what forgiveness to the success of the foremost, returning with contrite face to offer the fruits of victory as an *amende*!

In such sport then, and on such an evening, we children once wandered away, regardless of distance or of time, until our well-filled baskets allowed no excuse for farther lingering, and the brilliant clouds in the west, now growing paler and paler, warned us it was time we should return home. Yes, we knew it well—that even then we were expected—that we must have strayed too far—that we were surely earning a lecture: but all the same was it to us in that happy heedless hour; and still, and still we loitered: now yielding to each fresh temptation of adding another, and yet one more, to our gatherings; now sitting on the mossy bank beneath some old hawthorn counting over our spoil; now argu-

ing which, in number or size, ought to reckon for most; and now making all contentedly equal by emptying the baskets, and refilling them from one common heap.

Thus engrossed, we had forgotten all but our occupation and ourselves, when suddenly a long shadow was thrown in amidst our little group; and raising our heads with a start, we saw standing between us and the last rays of the sun a figure not at all like the gigantic one prostrate before us. It was only a young lad, not very much older than the oldest of ourselves, bare-headed, barefooted, and with garments more picturesque than entire, evidently the shepherd of the flock, which, now closing up together as they hastily cropped the short herbage at our feet, told audibly, as well as visibly, that they at least felt it time to prepare for the night.

The boy returned our look of inquiry with one still more searching, relaxing at last into a sort of comical glance as he spoke some words in Irish, which we guessed to mean that he had mistaken us for fairies; but changing the expression of his face in an instant, with a perplexed but still shrewd and inquisitive look he thus more intelligibly addressed us:—'If ye didn't rise up out of the earth, or drop down from the sky, at anyrate 'tis far from home ye must be, and the night coming on. Where is the house that would hold ye, or the people that own ye, for I never laid eyes on the likes of ye before?'

True enough now was our time to look really startled. We all stood up, heedless of our overturned baskets and their lately-valued contents; we stood up, and gazed far and wide, as well as the fading light would permit; but not one familiar landmark could we descry, and turning to each other with faces blank with dismay, the one thought needed no words to express it—we have wandered too far: we are lost! How exactly that scene returns—that feeling—the miserable transition from unthinking enjoyment to alarm and care; the sudden importance acquired by the ragged little shepherd, as we all turned our eyes on him for information and advice, and his own quick consciousness of his position, as, assuming the great man in a moment, he looked down on us wretched little people with a grave and troubled air, all the while preserving an ominous silence, more reproachful and alarming than words could have been! At last the smile that all the time had been lurking in his eyes broke out into a laugh of irrepressible gaiety, as, bounding down from the little mound on which we were standing, he led the way to the brow of the hill behind us; and there, on the other side, far away indeed across the valley, but still within view, pointed out a line of plantation, at the same time pronouncing the name of our home with another quick glance of inquiry, succeeded by a nod of satisfaction, as we all joyfully exclaimed, 'Oh, is it there!' And yet the sight was but a passing relief. Every one that remembers an adventure of childhood, can recall how powerfully imagination always magnified the danger or the delight; how far away the landmarks seemed—how very near the clouds; and we, young as we were, being well read in story, all kinds of recollections mingled with our anticipations to heighten our distress: wild beasts, banditti, forests, caves; the wide, wide valley before us, the river in which some one had been drowned; until at last a night on the hill, and a bed on the heather, seemed the better alternative to those imaginary fears that conquered the more rational dread of alarm to our parents, and anger to ourselves. But there were brave little hearts amongst us after all; and their exhortations, with reiterated assurances of safe guidance from our new friend, at last gave some courage even to the most timid; and with spirits somewhat calmed, and hearts at anyrate resolved, we set out 'eastward darkly going' on our pilgrimage home.

So this was our first acquaintance with Shaneen. We have dwelt so long on the introduction, that there is hardly time to tell how well he fulfilled his under-

* The completion of Mr Stevenson's labours has been the preparation of a splendid quarto, giving an 'Account of the Skerryvore Lighthouse, with Notes on the Illumination of Lighthouses.' Adam and Charles Black, Edinburgh. To the narrative portions of this volume we are indebted for the materials of the above paper. The scientific details, and numerous illustrative plates, give the work itself an attraction which must be felt considerably beyond the bounds of the profession.

taking; how the look of mischief and fun vanished at the sight of our evident distress; how nothing but good-nature shone out as he would stoop to mount the smallest of us by turns on his back; how exactly he made his way to the ford with the stepping-stones; how he knew all the short cuts, and the gaps in the ditches; and above all, how, when utterly foot and heart-weary, some stumbled and fell, declaring they never again could get up; how he drew out, as if by magic, a little fife from his pocket, and playing up a well-known national air, put fresh vigour into us all, and enabled us to march steadily to the sound of it for the rest of the way.

He was a wonderful Shaneen! What a speech, nothing daunted, he made in our favour when we hadn't a word to say for ourselves! What a first-rate performer we all considered him, when, forgiven and rested, we were allowed after supper to bring him into the parlour, and hear him play two tunes more, a slow and a merry one, before we went off to our nests! What regrets when we inquired for him again in the morning; and yet what approval to find that no persuasions could induce him to desert his post for the night, and that, before our weary heads were well laid on the pillow, he was off and away to his flock on the hills! But from that time forward Shaneen often paid us a visit. Many an old tune he taught us, many a new one he learned: gradually he was made possessor of shoes, and a cap, and more comfortable clothing; and then he was taken to watch our own sheep, and then at last he was sent to school. All was well until then: but Shaneen was a born idler. It was said he was a genius; but if so, it lay between mischief and music—his friends giving him credit for the one, his foes for the other. He would set the whole school distracted with his song or his whistling, his pranks or his jokes; and the master could never leave the house for ten minutes, without finding himself recalled by the sound of the fife. This was particularly unfortunate, as he was of an agricultural turn, and would gladly have made leisure, even during school hours, to bestow on his farm. Under the monitorship of some good stupid lads, this had been always attainable, until the luckless moment of Shaneen's admission: then all was turned upside down. What a scandal to have the puffers-by think he was 'holding a pattern,' when he, the decent man, had set all to their Voster, and little expected to find them figuring in a reel when he came back from the field! Human patience could bear no more; so Shaneen also probably thought after undergoing a mercurious drubbing; and being further threatened with expulsion, he escaped the disgrace by a voluntary flight.

Very sorry were we for poor Shaneen, and uneasy about him too. Days and months passed away without bringing any tidings, and we often blamed the school-master, and even sometimes blamed ourselves, as we remembered the simple pastoral life from which we had withdrawn him, and feared that it had but badly prepared him for the friendless intercourse with the world to which in all probability he had subjected himself.

But long as we had known Shaneen, we did not really know him: he had a plan of his own, to which all his aspirations long had been tending; and he was only waiting an opportunity to place it before us in a favourable light, when his hopes were completely upset by finding us bent on his mental improvement. Silently submitting, he was still heard at the time to say, 'If the could mather must make a scollard of me, why, there's no saying agin' it. I'll do my best; and no blame to me or his honour if natur breaks out.'

This soliloquy was often afterwards remembered in his favour when charges of ingratitude were brought against Shaneen; and he had still better advocates; for never would a burst of the dairymaids' chorus float in from the bawn, or never would an old lonesome Irish air rise up from the valley, whistled by the ploughman as he followed his team, without reviving a memory of our own little minstrel, and winning even the most

obdurate to say, 'I wish we could tell what became of poor Shaneen.'

At length a round-about message gave news of his existence, and of his yearning to see us again. Poor fellow! he had viewed his offences in a much more aggravated light than any one else, as he did not venture even to send a direct messenger with his earnest request for forgiveness, and permission to play for the dancing on 'Miss Lucy's birthday;' and we with curiosity, or rather interest, too much alive to await his arrival, had some difficulty in tracing the intelligence to a source that could supply us with farther news. At last we made it out, and then for the first time learned that Shaneen's enterprising spirit had worked out the fulfilment of its own early day-dream. By a kind of free-masonry, which stood him instead of other recommendation, he had ingratiated himself with a favourite old piper, who used to pay his periodical visits quite in reputable guise with his pony and his boy. To become his pupil and attendant was Shaneen's secret ambition, the plan for which he had hoped our influence would not be refused; and he had only been waiting the next visit more effectually to propose it, when he was thus suddenly thrown upon his own resources, and acting for himself at a venture, succeeded as well as if he had all our interest at his back. The old man took a fancy to him at once, taught him his art, made him the companion of his wanderings—the life of all others most delightful to Shaneen—and even in regard to his feelings, withdrew for a while from the line of route which included the scene of his delinquencies; and finally, quite won by his assiduity, his talent, and his progress, bequeathed the pipes and the pony to 'his worthier hands.'

And now, to use Shaneen's own phrase, he was 'settled for life to travel about.' The first use he made of his independence was, as we have told, to renew his intercourse with his earliest friends; and never surely was arrival hailed with greater pleasure. He came exactly on 'Miss Lucy's birthday.' How we rejoiced in his advancement, wondered at his improvement, praised and introduced him to our assembled guests; while invitations and engagements came so fast upon Shaneen, that one would have thought there was to be nothing but dancing for the rest of the year. Merrily on our side we set the example; well was his part performed; and dear little Lucy, when she stood up at the top of that long country-dance set, promoted for the first time to the honour of a grown-up partner, what would she have done, 'midst her embarrassment and blushes, with every eye fixed on her, waiting until she named the dance—what would she have done with that cruel partner that enjoyed her confusion, calling audibly for 'Miss Lucy's fancy,' by way of giving help, had not sly Shaneen, prompt and good-natured as ever, caused a diversion, and given them all full occupation in a moment, by playing up that irresistible measure, the Fox-hunter's Jig?

Honours and rewards fell thick on Shaneen—Mr O'Flaherty now, except amongst ourselves. In those jovial days he was made welcome wherever he went: short need be the invitation that at the same time announced his arrival; and many an impromptu ball was got up for the sake of the piper, instead of the piper being summoned to attend at the ball. Indeed it began to be whispered that prosperity was spoiling him—that he had his especial favourites, and could be relied on only by them: but we never found out that he unreasonably disappointed any; and if he had favourites, could we blame him while we were at the top of the list?

Once only—for complaints were always brought to us—we found it hard to excuse him, when, being appointed piper to the Esmonde Hunt, and called on to play for the club after dinner, he shut up his pipes and walked out of the room, because whisky punch was ordered for him while the members were enjoying their claret. It surely seemed an absurd impertinence: but he had his favourites there too, and some of them followed to

remonstrate—some advising him to apologise, some requesting him to return, and all promising better treatment for the time to come: but no; Shaneen was inexorable, and to all their intreaties gave this one answer, comprehending all he would say for past, present, and future—'Twas not for myself, but for my music I stood up; 'tis that alone that brings me into such honourable company, and for its sake I expect honourable treatment wherever I go. I would play for the childer on the cabin flure, and thank them kindly for the dhrink of cowl water they brought from the spring; the girls at the farm will never say I slackened my hand when there was nothing in theirs but the cup of fresh butter-milk; and yer honours can remember that many's the time the jug passed backwards and forwards between the cowl masher and myself, till I bothered him fairly to sleep with "The colleen dhas cruthen a mo." But new music for new fashions they will never match me—and if I once was to light up my heart with a dhrup of the cratur, while the cowl wine was quenching their hearts and their brains, believe me for once—and there's no more use in talking—we'd part before the end of the night with more difference than now.'

There was no arguing further; the club dinners lost their chief attraction: but one of the members secured it at once for his own. A jolly old sportsman, he applauded O'Flaherty's spirit, dubbed him his family piper, and carried him home. Here for a while Shaneen seemed quite contented, 'with the best of treatment, company, music, and dancing galore;' but at the first opportunity the errant nature once more broke out: he transferred his allegiance from the father to one of the sons; and sorry, though not much surprised, we received his farewells before he set out with 'Master Darby,' and some others as restless and enterprising as himself, to try their fortune in fighting with the Irish legion for the young queen of Spain.

Their fortune was sorely tried—to believe their own story—the fickle goddess having made them her especial sport. But in one respect they were successful—they returned again; though without one other companion left to contradict or confirm their tale. For this singular good luck Master Darby modestly and quite satisfactorily accounted, by hints of royal regard, which of course no one expected to have more fully detailed; but Shaneen, who did not feel under such deep obligations, whispered, in confidence, that they had barely escaped from a prison, where he at least was near being ruined for life by the rats having taken a fancy to nibble his fingers and toes; and he never could remember the outlandish name of that princess to whose favour Master Darby imputed their deliverance, though always ready to swear in Spanish, English, and Irish, that she would gladly have made him her own, only he thought it rather pleasanter to come home with his head on his shoulders than remain to have it chopped off for the amusement of 'the furriners. Upon my life it is no lie, though not one of ye believe me. If Miss Lucy was here, 'tis she would give me credit, for she understood my manners, and knew I always meant the truth when I told a good story of another or a bad one of myself.'

But Miss Lucy was no longer there—that ally was gone. Whether in a spirit of observation or of prophecy, Shaneen struck the right chord when he played the 'Fox-hunter' as Miss Lucy's fancy. Happily her choice possessed other perfections also, and more than supplied the place of home and friends when they had to cross the Atlantic together, and settle for a while in a distant land. There, one evening at a party in her own house, an Irish officer in command of the neighbouring garrison came up to her with a smiling apology for bringing an uninvited guest; 'but,' added he, 'we brought a piper over from Ireland with the regiment—a capital one too—and I thought, for the sake of our common country, you would like to hear some of its old music again.'

'Oh surely—most gladly,' answered Lucy eagerly:

'you do not know what pleasant recollections the sound would recall;' and beckoning to her side two little prattlers, in whom she had an especial property, and who on this occasion had been allowed to sit up somewhat later than usual, she prepared them and the circle round her for the enjoyment they were about to have.

It was a large, long room, and at the farther end the musician entered, and making his bow, took a seat near the door. Lucy's glance just rested for a moment on the uniform of the regiment, and then leaning back in her chair, with eyelids half-closed, in silent pleasurable expectation listened to the first few preluding notes; but hardly had they floated up along through the room, when, starting, her eyes met those of her husband's, turned towards her at the same moment, and instantly the same exclamation burst from each, 'Can it be—can it possibly be Shaneen?'

It really was himself. In a minute they stood beside him; in a minute glad words of recognition, of surprise, and of welcome had mutually passed; then followed the hurried questions, when, how, and why did he come all the way; and of course Shaneen in one word threw the blame on 'the praties;' adding, that between poor-laws and poor-houses, 'ould Ireland was no place for a gintleman now. And the short and the long of it, Miss Lucy, asthore—madam, I mean, begging yer honour's pardon—sorry a wedding or a christening from Advent to Shrove, or to Advent again; and when mirth is gone, music may well say good-by.'

'Well, Shaneen,' said Lucy's husband, 'I hope you will find a different story here; and as they are all in expectation, will you give us once more "Miss Lucy's fancy," for the sake of old times?'

Shaneen's lively glance rested on them both for a moment with its happiest expression; then something made him bend over his pipes as if to tune them; but they wanted no tuning, so again looking up, he said gaily as ever, 'Shall I give it all to them? The "Madhereen Rhue" will astonish the natives.'

'Then do give it all,' answered both of them laughing; 'and yet not to astonish the natives, Shaneen, but for the sake of many an Irish heart now in the room, that will warm to the sound of the Madhereen Rhue.'

We hope that few of our readers are so unlucky as never to have heard this exciting composition. Played on the Irish bagpipe, and by a good performer, it gives, as far as mere sound can convey, a scene of life and motion, a complete idea of a fox-hunt—the 'Madhereen Rhue' being the Irish for 'the little red dog,' *alias* 'Mr Fox,' whose peccadilloes form the opening and burden of the air all along in every interval between the find, the pursuit, the death, until at last the supposed convivialities of the evening are wound up by the never-failing Fox-hunter's Jig. Even on the spot where those scenes are real, how often have we been carried away by this lively representation! What, then, must have been its effect on those who now heard it again for the first time in a foreign land? All outward, all present associations forgotten, once more the hand was on the bridle, the light laugh upon the lip, then the gathering by the covert-side, the throwing off, the breathless pause; while amidst the measured notes would break in the chopping of some favourite hound, then another, and another, and then the wild burst as all mingled in full cry, and were off at a view: hardly could even Lucy refrain from joining in the 'tally—tally!' that broke from every lip; hardly could she bear the laugh it excited the next minute; and proudly would she have directed her husband's glance to the old Irish blood mantling up in the cheek of their own bright boy, as instinctively it warmed to the sound, had she not been restored to recollection by a smile that said plainly, 'I trust he is born to better things.'

Poor Lucy, she answered the smile with another, that might just as well have been a tear, for memory at the moment would not down; and in the young beaming face beside her she saw again her own boy brothers, and many a dear companion of their time; and now,

when the music saddened, and the wild lament at the death was played, when it seemed answered back again by the still wilder echoes of her own native glen—and last of all, when her darling, forgetful of everything but his delight, sprang across the room, and threw his arms round Shaneen's neck, she was fairly overcome, and burying her face in the sofa pillow, wept outright.

Again, poor Lucy, what would she have done but for 'the winding up?' when her own dear husband, taking her hand, led her forward, and each individual, old and young, in the room, following their example, the past and the future were swallowed up for the moment in the present enjoyment of the Fox-hunter's Jig.

And Shaneen, amidst a continually-shifting tide, has at last, strange to say, come to a quiet anchor: he has found out that there are better ways of settling than 'travelling about,' being partly indebted for the discovery to Lucy's light-hearted Canadian maid. But still, even as in earliest days, his notes give fresh life to the disheartened and weary ones: many a poor and careworn emigrant has passed onwards, revived by some well-beloved strain that was heard in the freshness of life's early promise, and now almost renews that promise again; while on happier occasions, when even far away over the waters, 'a rare Irish wedding' may be still brought about, who like Shaneen to complete the illusion, and make them all but believe they are dancing again with 'those they've left behind them?'

A WORD ON A DIFFICULT SUBJECT.

In 1846, an Industrial School for the education of poor children gathered from the streets was established in Dundee, from which the best effects, as regards the diminution of petty crime, were confidently anticipated. We are sorry to observe by a police report in a Dundee newspaper, that notwithstanding the operations of this useful seminary, crime cannot be said to have diminished in amount within the town; at least only two persons fewer have appeared before the police court in 1847 as compared with the number in 1846; while there is an increase of 101 persons as compared with 1844. This phenomenon has naturally attracted considerable attention, and the conviction is arrived at, that there must be 'some power at work' counteractive of the exertions made to cut up crime at its roots, by the establishment of the institution to which we have referred. If there be such a power, what is it? This is a question which merits an earnest investigation, and we could have wished that it had engaged the attention of the local authorities, and others interested, in a manner which would have gone far to settle all doubts on the subject.

At a public meeting which ensued on the publication of the Report, all the speakers, the resident sheriff included, were of one mind as to the cause of fully one-half of all the criminal cases which occurred in the town; and that cause, as will readily be supposed, was inordinate indulgence in intoxicating liquors. The power counteractive of peace and orderly behaviour was traceable to drink. On this point there could not exist the slightest doubt, for the fact was proved by statistical analysis. Having arrived at this unavoidable conclusion, the speakers one and all seem to have formed the opinion that the cause of drunkenness was the great number of public-houses and shops in which drink was sold; and that it would be proper to adopt all reasonable means to have that number reduced. One speaker, a clergyman, imputed the evil chiefly to the opening of public-houses on Sunday, and contended for some rigorous measures to enforce their being closed on that day. There the matter appears to have rested.

It is to be regretted that bodies of intelligent men

should almost systematically take so narrow a view of this very serious and complicated subject. That much crime is imputable to drunkenness, is quite true, but drunkenness is surely nothing more than the cause-proximate: there is a cause remote—a cause which causes the drunkenness; and can that, with any justice, be said to be merely the number of public-houses—the convenience presented for purchasing and imbibing liquors? Of course temptation leads to error; and every well-disposed person would wish to see the temptation to drinking lessened as far as is practicable. On that we agree with the speakers on the above occasion. But we hope to be excused for stating it as our belief, that local authorities will find it necessary to go somewhat deeper into social statistics, if they desire to reach the origin of the mischief.

The prevalence of habits of intoxication in Scotland would require to be investigated on a comprehensive scale, and with constant reference to the usages and social condition of other countries. A few observations will show the necessity for this form of inquiry. Drunkenness is caused by the cheapness and accessibility of liquors, says almost everybody. But how does this assumption agree with the fact, that there are countries—Holland, for example—where intoxicating liquors are abundant and cheap, and yet the people in these lands are comparatively sober in their habits? Again, drunkenness is pretty generally ascribed to the opening of public-houses on Sunday. But this assumption is met by the equally startling fact, that there are countries where there is no legally-recognised Sabbath, and where nearly all kinds of traffic are carried on as usual on Sunday; and yet the people in these countries are less given to habits of intoxication than the Scotch, or even the English. We appeal to all travellers if such is not obviously the case. Nothing is more common than to hear otherwise well-informed persons accounting for social evils by an exclusive reference to things only secondary or superficial, or which, in reality, have no actual connection with the subject. How frequently, for instance, do we hear it stated that the whole cause of Ireland's poverty and wretchedness is Roman Catholicism, while, by taking a short trip to Belgium, it would be distinctly seen that a country may be most intensely Roman Catholic, and yet that its people may be sober, orderly, industrious, their houses and farms models of neatness, and their morals unexceptionable. To account for great national idiosyncrasies by a reference to causes not borne out by principles universally applicable, is neither wise nor safe. In all investigations of this sort, we must ever take human nature, with all its aspirations and failings, along with us.

A volume would be required to treat the subject of intemperance thoroughly; and all we can here expect to do, is to point out the fallacy of imputing this monstrous evil to either Sunday trafficking or general dram-selling, and to lead those who possess more leisure into the track of right investigation. For the sake of seeing an effective reform accomplished, we would wish to toss overboard the small and local notions which at present unfortunately misdirect public attention. Let the authorities by all means proceed to regulate the public-house system; but with the assurance that *where there is a demand, there will be a corresponding supply*. They may rest satisfied of a fact warranted by experience, that the shutting up of all public-houses on Sunday, as some have recommended, would probably lead to the sale of liquors in private or unlicensed dwellings. As it is, no little tipping takes place by the clubbing of once to introduce quantities of spirits into private houses; for by this means the profit to the public-house keeper is saved. And how far such clandestine practices will be aggravated by the general closing of licensed houses need not be particularised. Any attempt whatever to lessen

the demand for intoxicating drinks, seems more likely to be beneficial than a mere attack on public-houses. In whom, at present, does that demand reside? The working and humbler classes generally. At a time not far distant, habits of intemperance were prevalent among the higher and middle classes in Britain; in the present day, such habits are languishing and expiring. These classes—all who aim at respectability of character—have attained to that degree of elevation of taste which leads them to shun, or in fact never to think of, dram-drinking as a means of enjoyment. A merchant or shopkeeper of ordinary standing walks every day from his place of business to his home, through long lines of street studded with public-houses; but during that walk, it never once enters his mind that he should turn aside for a dram. He perhaps meets acquaintances by the way; he exchanges a few words with them; still he does not think of going off with them on a carouse. He attends a public meeting in the evening, and mixes and converses with many persons whom he is glad to see; but when the business of the assemblage is over, all are seen to take their way homeward. They do not adjourn to taverns to drink: each goes off to his own fireside. Such is now the conduct, we say, of the middle classes generally. In certain quarters there are exceptions; but they are dying out. Even at the entertainments of the middle classes, how little wine or spirits is now consumed! Some guests take only water, or tea, or coffee. Many taste the wines placed before them only as a matter of form; and this form is gradually relaxing. It is likewise pleasing to notice that at these entertainments no one presses another to drink: that has long since gone out of fashion. And yet temperate as people usually are on these occasions, there seems no diminution of pleasurable sensation. Anecdotes are told, wit sparkles, interesting subjects of conversation are started; the jest passes more quickly than the bottle. Some improvements doubtless still remain to be effected, if only in the forms of entertainments of this kind; but, all things considered, they are wonderfully temperate affairs, and show a prodigious advance on the manners of but half a century ago.

Now, if such be a tolerably correct picture of what prevails among the higher and middle classes, we wish to know what it is that hinders the working-classes, so called, from arriving at the same tastes, habits, and position. The operative is endowed with the same physical constitution as his employer. The Almighty has not set the seal of demoralisation on one more than another. All, of whatever station they be, possess, elementarily, the same faculties and feelings, qualified only by circumstances. There is nothing, then, abnormal in the bodily or mental conformation of a manual labourer to make him a drunkard. We mean to say there is no reason which can be traced to nature why one order of individuals should habitually yield to the temptations of the gin-palace, while another order of individuals should as uniformly resist or overlook them. The weakness which yields to such miserable temptations would almost seem to originate in some external but powerfully-influencing circumstances. Constant monotonous employment, which leaves little time for mental cultivation, will be given as a ready explanation of the phenomenon; but unfortunately for the invariable soundness of this line of argument, the appetite for intoxicants prevails as strongly among the idle or half-employed as it does among the busy. Besides, persons belonging to the middle class are in numerous instances as hard wrought, are engaged in as dull drudgeries, are pressed on by as painful cares, as those in the humbler departments of society; yet we do not find that they seek solacement in taverns. A poor clerk in a public office, whose toil is as unvarying, and scarcely more intellectual than that of a horse in a mill, does not spend his Saturday nights or his Sundays in a course of intemperance. Why? Because his tastes are superior to such practices. His self-respect, his wish to stand

well with the world, everything, acts as a shield against temptation. It might perhaps be well to inquire whether the method of paying wages weekly, or in small sums, had not some influence in creating that remarkable difference of habits between the manual-labouring and other classes? A clerk receiving £50 per annum in half-yearly payments, is found to be sober in habits, and to aim at respectable economic management; whereas an operative receiving his salary in the form of £1.1 per week, is, as a general rule, inspired by totally different feelings. In Glasgow, ten thousand men go to bed drunk every Saturday night, are drunk all Sunday, and remain drunk part of Monday! Such is the testimony of a local magistrate. Who are these men? Are they operatives liberated from workshops and factories, each with from 15s. to 25s. in his pocket, or are they persons whose payments are made by the quarter or half year? We say it would probably be of no small importance to ascertain how far the working-classes might be raised in the social scale by being placed on the same level as to forms of payment with clerks and other salaried assistants. The question is eminently worthy of consideration by those authorities who are groping about for means of diminishing crime and intemperance. We are inclined to think that no small good would be done by extending the term of payment from a week to a quarter—to give a workman no longer a wage, but a salary—provided the operative classes were sufficiently economic to permit of their accepting such a change, and provided it would be always quite safe for them to leave their earnings in the hands of employers for a space of three or six months.

Without at present going further into this interesting question, it may be admitted, by a reference to the habits of operatives in other countries, that even during a continuance of the weekly wage system, there exists a possibility of raising the standard of individual tastes, and meliorating the more objectionable habits of the manual-labouring classes. The manner in which persons in respectable circumstances—and among these we gladly include many individuals occupying the position of workmen—have redeemed themselves from the vice of intemperance, seems to point out how this may be done. The acquisition of a taste for reading, a love of music, a love of home: literature and the fine arts, in short, are among the engines of refinement that may be principally employed. Nor should we omit to record the efficacy of those simple beverages, tea and coffee, in carrying out this great moral revolution; for to nothing has the cause of temperance been more largely indebted. Soirees, lectures, reading-rooms, public meetings for objects of an intellectual kind, should all be pressed into the same service; for where men and women meet together in orderly assembled, where decent attire is expected, and polite attentions are interchanged, drunkenness with its madness, rage, and disorder, can never hope to enter. We are all prone to imitate; we learn, in fact, more from example than by precept; and where different grades meet, and the orderly and self-respecting prevail, the inferior elements will soon be absorbed and assimilated. The duty to reclaim is equally imperative with that of being reclaimed; and while we associate with the prudent and respectable, we dare not, as Christians, abandon the dissolute and disorderly. 'They that are whole need no physician;' and to the weak and erring the middle and higher classes must direct more of their attention, if they would have them reclaimed. Despised, abandoned, and shunned, the victims of vice and intemperance have nothing human to lose; regarded with due interest, self-respect begins to rally, and no man willingly, or all at once, would forego the good opinion of his fellows. It is too much the fashion to lecture and counsel in the abstract, and to neglect the more potent appliance of a practical friendly attention. Thus let society, with all the aids it can derive from education and religion, address itself to the duty of superseding vicious by correct tastes—of calling up

emotions which are at present not dead, but only benumbed by habits and circumstances. In the success of the effort we would have greater hopes than a vengeful onslaught on public-houses.

LONGCHAMPS.

It is well known that politics are altogether excluded from the pages of this Journal, its object being rather to harmonise and elevate the character of the people, than to excite those disturbing emotions which are so often awakened by the perplexing problems of political science. Therefore have we, in these stirring times, allowed the tide of revolution to sweep across our European continent, without tracing out its course, or speculating on its probable results. We must, however, crave permission to depart so far from our prescribed path, as to notice the silent crumbling away of one mighty power, which, within the brief space of the last few weeks, has faded into obscurity, and whose fallen fortunes may materially affect the people of this kingdom. Whig and Tory, Radical and Conservative—all have equally bowed to its sway; all are equally concerned in the departed glory of Longchamps.

This subject may be supposed exclusively to affect the female portion of our community; but while it is true that the *artistes des modes* and their multitudinous employers are chiefly concerned in the matter, let it not be supposed that the lords of creation are altogether unaffected by it. How many a worthy squire has exchanged the produce of his broad acres for those graceful and delicate fabrics on which the stamp of fashion had been affixed at Longchamps! How many a domestic plan has hinged upon its expected decrees! Even to our most remote and dullest country towns has its influence extended; and oftentimes has the lighting up of Hymen's torch been delayed until Longchamps had issued its despotic mandates touching the form and materials of a bridal *trousseau*. Nor is it in Great Britain alone that Longchamps has hitherto exercised its magic sway. The professed simplicity of republican life has not exempted our Transatlantic neighbours from its influence; and in our Asiatic empire, the costly tunics of the East are fashioned by Indian tailors according to the spirit of its dictates.

May we not, then, be allowed to express our regret that Longchamps has shared in the vicissitudes of the present eventful times; and that its glories have been suffered silently to pass away, without even the redeeming *éclat* which might have rendered its extinction a matter of history? Such has been its recent fate; and at the present moment of desertion and neglect, we think it due to so renowned a spot to trace out briefly the origin of its fame, and of that despotic sway which it has been wont to exercise over a large portion of our globe.

It is pretty generally known that through one of those strange fatalities by which events the most dissimilar are sometimes linked together, the modish sway of Longchamps had its origin in devotional attachment to its celebrated abbey. Before speaking, therefore, of its more recent history, we must carry back our readers from this present busy bustling century to the Gothic ages, and tell them that, owing to the favour of King Robert the Pious, some peculiar privileges were granted to the Abbaye de St Maur (situated near Vincennes); and amongst others, he conferred on it that of being the only monastic church in the diocese of Paris wherein the laity were allowed to attend the services of the church—a permission which was so acceptable to the lay part of the population, that on the occasion of certain solemn festivals, a vast crowd of people were in the habit of pressing within its sacred precincts. At such times it was expected of all the officers of justice belonging to the several domains which were attached to the abbey, that they should appear there in attendance on the lordly bailiff. And the male inhabitants of the village of St Maur, fully armed, responded also to the

appeal of their magistrates and officers, in whose train they walked in procession, with drums beating and colours flying, to the collegiate church. This sight attracted a crowd of artisans from Paris, whose presence did not deter the ladies of the court from continuing their devotions there during the Holy Week, inasmuch as it had for ages been the established usage for every woman to appear there who was privileged to ride in a coronetted equipage. This was a religious custom, which had originated with Queen Bertha, the daughter-in-law of Hugh Capet; and it would have been deemed a sort of profanity to have neglected a tradition which had descended throughout so many generations.

Towards the year 1730, however, the parochial bands began to discharge their firearms occasionally within the walls of the church, which failed not to attract a great concourse of the Parisian populace, and naturally resulted in much irreverence.

The simple monks of St Maur thought to find a remedy for this growing evil by exposing in the midst of the choir all the sacred relics of their sacristy, which, they doubted not, would excite the respect of the people. This innocent device only augmented the tumult; for thereby were attracted from the quarter of St Antoine, and from the neighbourhood of Charpenton, a multitude of sick people, who not only attended the service of the *Ténèbres** on Good-Friday, but insisted on passing the night within the walls of the church, in order that they might be present at the early mass on the following morning. A terrible uproar was the consequence. The cries and supplications of these sick people were frightful. They were carried round the church in the arms of several strong men, and shouted with all their might, 'St Maur! St Maur! obtain my cure, I beseech you!' The bearers made a still greater noise by crying out lustily, 'Room for the sick! More air! more air! Away with red!' and then every woman who had a shred of scarlet about her made haste to conceal it, and some charitable men busied themselves in fanning the infirm beings with their hats. There were, moreover, image-vendors, and sellers of wax-lights, and lame beggars asking for alms. In short, there was such a hubbub, that it was impossible to hear any of the services, and sometimes the chants were sung in four or five different keys in the different angles of the church.

The end of all this was, that the Archbishop of Paris issued an episcopal mandate, signifying to the good people of the metropolis, as well noble as plebeian, that they must go and chant their office of the *Ténèbres* elsewhere than at St Maur-des-Fossés, inasmuch as it would henceforth be closed, and guarded during Passion week by a picket of the French Guards.

This was a great relief to the monks of St Maur, who had been thoroughly disquieted, and even alarmed, by the tumults and disorders which had recently taken place within their church. The measure was cordially approved of by all truly religious persons; but there were certain *dévotés* who abused the archbishop as roundly as if he had placed all the churches in his diocese under an interdict; some of them even threatened to appeal against so enormous an abuse to the king, which, reaching his majesty's ears, amused him exceedingly.

'There are,' says a contemporary French writer, in alluding to this subject—'there are to be found in every place some worthy people who don't like to meditate at home, and who never wear out the velvet of their own *prie-dieu*. They complain that their parish church is damp, or the incense burnt there of so inferior a sort that it gives them a headache; or else that the doors of the church close so imperfectly, that they always catch cold there. To such people the journey to St Maur was

* In Roman Catholic countries, the churches are darkened on Good-Friday, by means of sable hangings, which exclude almost every ray of light, so that the services are performed amid deep obscurity; hence the term *Ténèbres* is applied to the religious services of that holy day.

an innocent party of pleasure, which they could not renounce, without bearing some ill-will to the archbishop who had deprived them of the recreation.'

Fortunately an opportune resource presented itself; for just at this time the Abbaye de Longchamps, which is near Boulogne-sur-Seine, was celebrated for its educational talent, and assiduous pains were bestowed on the musical instruction of the young ladies who were domesticated there. Mademoiselle Lemore, a favourite opera singer, had, on her conversion, retired into this place of religious seclusion, and her rich voice was heard to swell amid the youthful choir of the abbey church. The Orleans family were in the habit of passing the Easter at St Cloud, and it seems that the enchanting music at Longchamps had won their attendance at the abbey during the religious services of the Holy Week. The beauty of its chants was soon spoken of at Versailles in such glowing terms, that the court ladies resolved to hear them, and from thence the fashion of frequenting Longchamps speedily reached Paris; so that from this period (1733) all the most elegant and distinguished persons of the metropolis attended the office of the Ténébres; and the entrance to the abbey church of Longchamps was so thronged on these occasions, that half the persons who sought to gain admission within its walls were obliged to retire without accomplishing their purpose. The financiers' wives came laden with all the diamonds of their caskets; the ladies in waiting from Versailles in their court costumes; the officers of the guard in full uniform. In short, it became the scene of fashionable hubbub and display; and the worthy archbishop, considering that the follies and frivolities of the great were as desecrating to these solemn services as had been the grosser tumults at St Maur, found himself obliged once more to exercise his episcopal authority, by ordering that the doors of the Abbaye de Longchamps should be closed during the Ténébres on Good-Friday.

Thus were the Parisian *beau-monde* excluded from those services which they had attended only from motives of curiosity or fashion; but meanwhile the avenues of Longchamps had become such a favourite resort, that the Parisians continued to flock thither as eagerly as ever on the annual recurrence of the same sacred season; nor were the company less brilliant or less numerous, because they had no longer any other professed object for their attendance beside the important one of seeing and being seen.

These assemblages, occurring as they always did at the close of winter, afforded to the Parisian *artistes des modes* the earliest opportunity of displaying their taste in spring and summer costumes. Hence it became the established law of fashion that no novelty in dress should be attempted until the flat of Longchamps had been issued concerning the forms and colours which should prevail during the ensuing summer. The supremacy in taste thus assumed by Longchamps has been undisputed for more than a century past, except during a brief period of that revolution whose iron sway, extending as it did to the most minute circumstances of life, invented the *coiffure à la guillotine*, and the *robe à la victime*; a miserable play upon words, which were but too full of stern and bitter realities.

No sooner, however, was tranquillity restored to the homes and hearths of France, than Longchamps quickly reassumed its supremacy in the world of fashion and of taste; and so universal has been the homage yielded ever since to its mysterious sway, that at the present moment, when it is virtually defunct, there is a sort of perplexity abroad as to the choice of costumes for the summer of 1848. Whether *mantelets*, or *visites*, or *pale-ôts* shall have the ascendancy in walking attire?—whether republican simplicity or Grecian elegance shall prevail in our drawing-rooms and in our assemblies? who shall decide?

May we not hope that a *provisional government* has already been established among the fair *modistes* of Paris, from whose secret council-chambers such artistic

decrees shall issue forth as to win the same ready and universal obedience which has for so long a period been yielded to the despotic mandates of Longchamps?

WELL ENOUGH.

WITHOUT wishing to be thought wiser, better, or more clear-sighted than my neighbours, I would nevertheless warn them against such phrases as the one selected as a title to this little paper. It is a very significant phrase, significant of a dangerous laxity in the character and conduct of those with whom it is habitual. 'That will do quite well enough'—'I have done it well enough'—are not words ever uttered by those who have a high, that is, a true sense of duty. No man who knows what work ought to be, can talk of anything he has done as being 'well enough.' It is a lazy, slovenly, 'make-shift' sort of spirit that can for a moment tolerate the idea of doing any given business just merely 'well enough.' Nothing is done well enough that we can, by proper exertion, do better. Let us still go on 'bettering what is best.' To do this, we must keep our minds well braced up to the highest point they can be stretched to, without an over-strain. Depend upon it, this tension is better for us morally, intellectually, ay, even physically, than the state of relaxation which is evinced by the use of the words, 'Oh, that will do quite well enough.' There is a whole world of unsatisfactory morality in these common and seemingly harmless words. If the spirit which prompts them were to rule society, society would speedily come to an end. The 'well-enough' principle has in it no ideal of perfection, no thought beyond the immediate and the present, no recognition of the Infinite. It is selfish, earthly, and unenduring. No race of men, no single man, was ever regenerated by doing things 'well enough'; the heroes, the reformers of mankind, took their labour as a Divine mission, and did it accordingly—'as well as in them lay'—if need were, dying in the act of completing or bettering their work. These were not the people to scramble or lounge through an allotted task, and then push it from them with the exclamation, 'There! that will do well enough!'

Let us glance for a moment at the vast quantity of rubbish cast upon the world under the courteous name of *work done 'well enough.'* Everywhere this sort of work meets us. In manufactures, in mechanics; in agriculture and in art; in legislation and in literature. In every department of civilised life there are found things, like Dr Wolcot's razors, 'made to sell'; things which have no reality in them—that is, which have no portion of the maker's *mind* invested in them, giving them their pro-principle of life—utility. Such things are indeed dead matter. They were made by people who put no heart into the work, who 'got through' it, who did not think of it earnestly, as a duty to be honestly, truly, religiously achieved for the use of others. With a false estimate of themselves and their mission (perhaps without a thought of either), they looked with contempt upon the object of their so-called work, and sent it forth as something 'good enough' for the occasion.

If men were but properly impressed with an idea of conscientious work—work done according to conscience—nothing merely *got through*, or made to look as if it were done, but honestly done, actually done, to the best of our ability, what a different world it would be then!

I do not desire to set up one set of people against another, or to insinuate that the world is altogether in a worse state than it was two thousand years ago; but there is no shutting one's eyes to the fact, that work is not so sacred a thing with us as it was among the ancients. As far as we can see, there was no inefficient *well-enough* working then. Look at the Roman roads, and aqueducts, and walls; at Grecian works of art, Egyptian and Indian temples and tombs. Now, these things were all done in earnest. Their makers meant

them to be as good as ever they could be—to last as long as possible. These works have the two ideas of perfection and of duration clearly marked on them. Those who made them, worked with these ideas in their minds, and they remain in the work to bear testimony to the fact. They may be read as distinctly there as if they were written in ineffaceable words. It would be mere folly to say that these ideas of perfection and endurance are peculiar to the looker-on of the present day; it cannot be so, for the remains of ancient work affect all lookers-on in the same way with regard to these ideas. Of course they suggest many others to different minds, but *invariably* they make men admire the greatness of the conception, and the enormous labour expended in the execution. Now let us turn to similar works among ourselves. Erections of public utility—let us look at them. Do they look as if they would last, or as if they were meant to last as long as a Roman road? How is it that railway bridges and viaducts are so frequently giving way?—that newly-built houses fall about men's heads?—that steam-ships are continually blown up? 'Oh,' some one replies, 'it is because we live so fast. We have so much to do, that there is no time for doing things substantially, as the ancients did: they could take their time about all their business.' I believe this to be no true reason. If we were impressed with a just idea of the necessity for being honest in our work, we should never be in so great a hurry to finish it as to leave the most important half undone. No: it is not from the rapidity of material progress around us, that our material works are so unstable, incomplete, and mean. It is from the want of a high standard of right in our morality of every-day life. We think of saving ourselves trouble, not of doing the work set for us in the best manner. We are all of us tainted more or less with this selfishness. We would all of us, like Bettine, 'strangle our duty, if we could once catch hold of its neck.' But this must not be. We must rouse ourselves, and get out of this low and contemptible view of life. Duty is not an ugly thing—a thing to be avoided. It is lovely beyond all earthly things, for it is heavenly. Whatever our work may be—whether pin-making or law-making—writing for others to read, or baking for others to eat—making railways, or preaching sermons—let us not try how little labour and pains we can put into it. Let it be our constant aim to do everything as well as we can; to leave as little as possible incomplete; and this not merely for the vain glory of doing better than our neighbours, but for the satisfaction of our own conscience: in other words, let us labour to make all our actions conform to the ideal standard of right and perfect within our own minds. When we do this, we shall never talk of anything we have done as being 'well enough.' We shall never on this earth do 'well enough.'

THE UGLY DUCKLING.

BY CHRISTIAN ANDERSEN.

[If our information be correct, we know nothing in this country of Danish literature, except through the medium of German translations; and the genius of these two languages unluckily has no correspondence whatever. But the translation we now offer to our readers has not merely a certain value as being taken from the Danish direct—it is a curiosity in itself; being the production of a young Danish lady, Zona Groos, of Kolding, who is self-taught in English, who never was out of her own country, and who never, except on one occasion, even conversed with a native of England. This want of ordinary opportunities, our readers will see, has not prevented her from acquiring a competent knowledge of English; and we know that she is able to read Shakespeare with great enjoyment. We may add, that in this curious piece Andersen is supposed to have allegorised his own career.—Ed.]

It was very lovely in the country, for it was summer; the corn was yellow and ripening, and in the green meadows stood the stork, on his long red legs, and talked Egyptian, for that was the language his mother had taught him. Round the fields and meadows were large woods, and in the woods dark blue lakes. Oh, it was a lovely scene! In the bright sunshine stood an

old manor-house, surrounded by a wall and a deep moat; and from the wall down to the water grew large leaves, so large and high, that a little child might stand upright under some of them; and here a duck lay upon her nest: she was brooding over her eggs. But at this time she was very weary, for she had sat long, and she had very few visitors—the other ducks liking better to swim on the moat than to sit under the leaves and quack with her.

At length one egg cracked after another, all the yolks were alive, and the little ones put forth their heads and cried, 'Peep, peep!' 'Quack, quack!' said the mother duck; and then the little ones looked abroad from under the green leaves, and their mother suffered them to look as long as they liked, for the green colour is very pleasant to the eyes, and not at all hurtful.

'How large the world is!' said all the little ones; for now they had more space to look about them than when they were in the egg.

'Do you think this is the whole world?' said the mother. 'Oh no: it reaches far on the other side of the garden, even to the clergyman's meadow; but there I have never been. I hope you are all here,' said she, as she rose from her nest. 'Ah no! the largest egg is still there. How tedious it is!' and the poor duck lay down again.

'How do you do?' said an old duck who came to pay her a visit.

'One of my eggs will not hatch,' answered she; 'but pray look at my others, are they not the loveliest ducklings you ever saw? They are the very image of their father, the rascal, who does not even pay me a visit.'

'Let me see the egg that will not burst,' said the visitor; 'surely it is the egg of a turkey! I was once imposed upon in the very same manner, and the little ones were very troublesome indeed to me; for I must tell you they are afraid of the water. Leave off trying to hatch that egg, and teach your other ducklings to swim.'

'I will try it yet a little longer,' said the poor duck. 'Do as you like,' replied her visitor, and away she went.

At length the great egg cracked. 'Peep, peep!' said the young one when he came out; but oh how large and how ugly he was! The poor duck stared at him.

'What a wonderful large creature!' said she; 'none of my others look like that. I hope it will not turn out to be a turkey; but that will soon be settled, for he shall go on the water, even if I push him in myself.'

The following day the weather was lovely, the sun shone upon the large green leaves, and the mother duck with her whole family went to the moat; and plash in she plunged into the water. 'Quack, quack!' said she, and all her little ones followed her, smoothly gliding upon the waves; and they were all there, even the great ugly gray creature was also swimming.

'No, it is no turkey,' said she. 'See how nicely he uses his feet, how well he bears himself; he is my own little one after all; and indeed he is not so ugly. Now come all of you with me, and I will introduce you to the world, and present you in the poultry-yard; but you must keep near me, and beware of the cats.'

So they went to the poultry-yard: here they found a terrible uproar, for two families had laid claim to an eel's head, which at length the cat seized.

'Such is the world,' said the mother duck, wiping her beak, for she, too, had taken a fancy to the eel's head. 'Now make haste; come and curtsy to the old duck there, she is the grandee of the whole poultry-yard; she has Spanish blood in her veins: and see, she has a red rag tied round one of her legs; that is a most delightful thing, and the greatest honour a duck can obtain: it signifies that she is not to be lost, but that both animals and men are to know her. Come on; look to your feet; a well-bred duckling spreads his feet wide, like father and mother; now curtsy to her, and say "quack!"'

And they did so as well as they could; but the other

ducks around said aloud, 'What! are we to have *them* also here, as if we were not enough without them?—and look how ugly that one is; we will not suffer *him* to be among us;' and so a duck ran and bit him in his neck.

'Let him alone,' said his mother; 'he does no harm.'

'No; but he is such an immense creature, and looks so odd,' said the duck that bit him.

'Your children are very pretty, my good woman,' said the old duck with the red rag round her leg; 'very charming, save that one which has not prospered so well; I wish he could be remodelled.'

'That is impossible, your ladyship,' replied the duck. 'He certainly is not handsome, but he has a kind heart, and he swims so nicely, quite like the others—nay, perhaps somewhat better; and as he is a drake, the beauty is not of so much consequence. I think he will be very strong, and then he will get well through the world.'

'Your other ducklings are charming,' said the Spanish duck. 'Now regard this as your home; and if you should find a fish's head at any time, you can bring it to me.'

And thenceforward they looked upon the poultry-yard as their home. But the poor duckling that was so large and so ugly was scorned and laughed at by the whole poultry-yard. The hens and ducks said, 'He is such a huge ugly creature;' and the turkey-cock, who was born with spurs, and therefore thought himself an *emperor*, puffed out his feathers, like a ship under sail, and marched straight up to him, and gobbled at him till his head grew red as fire. The poor duckling knew not whether to run or stand still; and felt very sorrowful at being so ugly, and the laughing-stock of the whole poultry-yard.

Thus it was the first day, and afterwards it grew worse and worse. The poor duckling was despised by them all; even his brothers and sisters were unkind to him, and said often, 'Would that the cat might catch thee, thou ugly one!' and even his mother said, 'Would that thou wert far from hence!' And the ducks still bit him, and the hens pecked him, and the servant who fed the poultry kicked him away with her foot.

At length he flew over the hedge; the little birds in the bushes were terrified. 'Ah, it is because I am so ugly!' thought the poor duckling; and he stole away. On he wandered till he came to the great fens, where the wild geese dwelt; and there he lay awake the whole night, weary and sorrowful. Next morning the wild geese flew up, and then they discovered their new comrade. 'What sort of a creature art thou?' said they; and the duckling turned to all sides, and made his best reverence. 'Thou art very ugly,' said the wild geese; 'but no matter, if thou dost not marry any of our family.' Poor creature! he did not think of marrying, if he were but suffered to lie in the reeds, and drink the muddy water in peace.

'Bang—bang!' two wild geese fell dead in the fens, and the water grew bloody. 'Bang—bang!' whole troops of wild geese flew up, and then the report again was heard. It was a large shooting party. The sportsmen surrounded the fens; some were seated in branches of the trees. The blue smoke from the guns hung like a cloud over the dark leaves and the water: the dogs searched the fens. What a season of terror to the poor duckling! He turned his head in order to hide it under his wing from such dreadful sights, and saw an immense dog with flashing eyes and red tongue. He opened his mouth, showed his sharp white teeth, and slunk off. 'Thank Heaven,' thought the duckling, 'that I am so ugly that even the dog will not bite me,' and he kept quite still while the shots were rushing through the reeds.

Some time after, all became silent, but yet he dared not move. He waited several hours; then at last he looked around, and left the fens as fast as possible. Away he ran over fields and meadows; and the wind blew so high, he could hardly go on. About nightfall

he reached a poor little cottage. It was so miserable, that it did not know to which side to fall, and therefore it stood.

The wind grew higher and higher; and looking eagerly for a shelter, the poor duckling saw that the door fitted so miserably, that there was room for him to creep in through the crack; and so he did.

There an old woman lived with her cat and her hen—the cat could catch mice, mew, and purr; and the hen laid good eggs; and the old woman loved them both as if they had been her children.

Next morning they discovered the poor duckling, when the hen began to cackle and the cat to mew: this attracted the attention of the old woman. 'What is the matter?' said she; but soon she too observed the duckling, and being short-sighted, thought it was some very large fat duck that had lost its way. 'What a good catch I have got; now I shall have duck's eggs! Ah I hope it is no drake: that we shall soon see.'

And she waited three weeks, but had no eggs. And the duckling found that the cat was master of the house, and the hen was mistress; and whenever they conversed, they always said, '*We* and the world!' and they thought themselves the greatest and best part of the world. Sometimes the duckling attempted to be of another opinion, but the hen would not permit it.

'Can you lay eggs?' asked she.

'No,' replied the poor duckling.

'Then hold your tongue.'

And the cat would say—'Can you catch mice, mew, and purr?'

'No.'

'Then you must be silent when wiser people are speaking.'

And the duckling sat in one corner of the room, and was always very sad. He thought of the open air, of the sunshine, and he longed to glide once more upon the water. At length this desire grew so strong upon him, that he told it to the hen.

'What an idea!' said she. 'You have nothing to do, and therefore you have such fancies. Lay eggs, or catch mice, and you will soon forget them.'

'But it is so delightful to swim upon the water,' said the duckling; 'so delightful to bathe in it, to plunge one's head under it.'

'Delightful indeed!' answered the hen. 'You have lost your wits to a certainty: ask the cat, the cleverest creature I know, if he would like to glide upon the water! Or even ask our mistress, the old woman (wiser than her there is none in the world), if she would like to swim on the water indeed, or dive under it!'

'Alas! you do not understand me,' said the poor duckling.

'But if we cannot understand thee, who can? Do you think yourself wiser than the cat, or the old woman, or even than me? Thank Heaven, my child, for your happiness. Do you not live in a warm room; and have you not made profitable acquaintances in the cat and me? But you are ungrateful, and it is not pleasant to hold intercourse with such: you may rely upon me that I wish you well, for I tell you all these unpleasant things, and that is the sign of a true friend. Now do your best to lay some eggs or catch mice.'

'I will go out into the wide world,' said the duckling.

'Pray do,' answered the hen.

The wretched duckling left the cottage; he soon met with some water; he plunged into it, and swam over it in rapture.

It was now autumn; the leaves in the woods became yellow and brown, the wind whirled them around, and then hurried them away, the air became cold, the clouds were heavy with hail and snow; it was a miserable time for the poor duckling.

One evening, just as the sun was setting, a whole troop of large beautiful birds rushed forth from the bushes; the duckling had never seen anything so fair; they were dazzlingly white, with long slender necks: it

was a troop of swans. They spread their large glorious wings, and flew away from the cold lands to warmer countries—to the sweet blue lakes; they soared higher and higher, and the poor ugly duckling was quite bewildered with their loveliness and their powers. He could not forget them, those beautiful, those happy birds: he knew not their name, nor whither they flew, but he felt such love to them as he had never felt for anything before: he did not envy them; how could he think of being like *them*, poor ugly creature, who would have been glad if even the ducks had suffered him to live among them?

Winter came, and with it the piercing cold of the north: the duckling was soon obliged to keep swimming round and round in the water of a pond, to prevent its freezing; but every night the hole grew smaller, and he was compelled to move his feet incessantly to keep it open; at length he became very faint, and lay quite benumbed in the ice.

The next morning a peasant passed, saw him, broke the ice with his wooden shoe, and bore him home, where he was brought to life again; and the children wanted to play with him; but the duckling was afraid of them, and in his terror he flew up into the milk-dish, so that half the milk was spilt. The peasant's wife began to scream; this frightened him into the butter-tub, then into the meal-box, and out again. Heavens! how odd he looked, all milk and meal! And the woman attempted to reach him with the tongs, and the children ran after him, laughing and screaming. What luck for the poor duckling that the door was open! Away he ran, and plunged into the snow, where he lay in a sort of lethargy.

But it would be too sad to describe the misery of the wretched creature during the long long winter. When the snow melted, he found himself lying in the fens; soon the sun began to shine warmly, and the larks to sing—the sweet spring was come. Then at once he raised his wings; they were far larger than when he last spread them, and bore him rapidly away: soon he saw himself in a large garden, where the apple-trees were blooming, where the lilacs exhaled their fragrance, and dipped their long green branches in the deep-winding river. Everything was full of beauty, and upon the water floated three fair swans, lightly skimming the waves with their dazzling wings. The duckling recognised the beautiful birds, and his heart throbbled. 'I will fly to them, the kingly birds. Perhaps they will kill me, because I who am so ugly have ventured to approach them; but no matter—better to be killed by them than to be bitten by the ducks, pecked by the hens, kicked away by the servants, and suffer all that I have done through the long rough winter;' and he swam towards the beautiful swans: they saw him, and approached. 'Kill me,' said the wretched creature, and bowed his head to the surface of the water, and expected instant death. But what did he see in the clear waves? His own image! and lo! he was no longer a clumsy, swarthy bird, ugly and despised—he was *himself* a swan! (It matters not to have been born in a poultry-yard, if one has but lain in the egg of a swan.) He was almost glad he had suffered so much. Now he knew better how to value all the happiness that surrounded him. And the swans swam round him, and stroked him with their beaks.

Some little children came into the garden and cast bread and cakes into the water, and the youngest exclaimed, 'There is a new swan!' and the other children repeated joyfully, 'Yes, there is a new one!' and they clapped their hands, and danced, and called their father and mother, and bread and cakes were thrown to him, and they all cried, 'The *new* swan is the most beautiful—so young and fair!' and the old swans bowed to him.

Then he felt quite bashful, and hid his head under his wing, he knew not why; but he felt *too* happy, but not *proud*; for a kind heart never becomes proud. He felt how despised he had been, and now he heard him-

self praised as the fairest of those fair birds; and the lilacs bowed to him with their graceful branches; and the sun shone out brightly. Then his eyes sparkled, he lifted his slender, elegant neck, and full of joy, he exclaimed, 'I did not dream of so much happiness when I was the Ugly Duckling.'

INTERCOURSE OF THE RUSSIANS AND CHINESE.

In 1728 the treaty of Kiakhia was signed, under which the intercourse between the Russians and Chinese is still carried on. This intercourse is described at some length by Mr Erman, to whose work we return;* and we now propose to condense his sketches, whether of an amusing or informing nature, and render them, from other sources, more complete than his own opportunities permitted.

Finding that we shall be unable to notice, as we had proposed, his very interesting account of the Samoyeds near the arctic circle, we must be content to rejoin our traveller as he begins to approach the southern frontiers of Siberia. Here, in the very midst of the largest continent in the world, we find him gazing with wonder upon an inland sea 360 nautical miles in length, and from fifty to seventy broad, and vexed by such sudden and terrible storms, as render it dangerous for vessels to carry topsails. The most violent wind that visits Lake Baikal, as it is called, is the north-west, which sweeps down from lofty and rugged mountains; but squalls almost as perilous are frequent from every point of the compass. The waves in these inland waters are often seven feet high. The avenue of the Chinese trade is carried round the lake in zig-zags over the mountains; but the safest line for traffic is over the ice of the Baikal in winter. By this route our author pursued his strangely-diversified journey. 'Thick mists,' says he, 'rose like smoke over the water, and seemed to float onward with the torrent, while beyond it we had the boundless surface of the frozen lake glimmering in the distance. List-venishnaya takes its name from the splendid woods of larch which extend over both sides of the spacious valley. We continued our journey by moonlight, and came to a rugged projection of the hills on our left, which formed a landmark between the Angara and the lake, and then struck into a narrow tract, hemmed in between its waters and the rocks which confine them. The jagged and shattered outline of these gigantic masses was sufficient proof that the sandstone must have already given place to another formation. An open space now extended for some versts along the shores of the Baikal, and after some time, we came upon a wide extent of ice, which we availed ourselves of, keeping close to the shore till we arrived at the post-house of Kadinaya. At this point we turned off from the western coast directly across the sea, till we made Posolskoi, on the opposite side. There was no snow upon the ice, so that its surface shone like a polished mirror in the moonlight. The horses that were put under our sledges in Kadinaya had to be held on each side till the very moment of starting, when they broke at once into full gallop, which they kept up till we landed on the further shore. We completed seven German miles in two hours and a quarter; this is undoubtedly the most extraordinary, as well as the most speedy stage upon any route in Russia. The smoothness of the way, however, was hardly more in our favour than the speed of the Buraet horses, which are supplied at the coast station. The regular and steady tread of our horses' feet rang over the wide and dreary waste, interrupted now and then by the creaking of the sledges, as they yielded to the draught; or by the duller noise emitted from the ice cracking under the increasing severity of the frost.'

Beyond this, the windows of the peasants were of pieces of mica sewed together with black horse-hair; and the verst-post of Tarakanova gave the distance of 5963

* From No. 229.

from St Petersburg, and 5450 from Moscow.* The inhabitants are thus, as our traveller remarks, but a trifling distance farther from the centre of the earth than they are from their own capital. The trains of sledges laden with tea, which had been a frequent sight along the whole road from Tobolsk, became now more numerous, each train comprising from 50 to 100 one-horse carriages, with tea sewed up in hides. Only a few drivers sufficed for the convoy; and the reason is, that they make it the interest of the horses to follow in line, by placing a bundle of hay on the hinder part of each of the sledges. Relays are hired from station to station, and thus the merchandise may be carried at full speed from Kiakhta to Moscow; and in the wild part of the country we are now traversing, it is curious to see the headlong troop bound out of the way like a flock of sheep when they meet a heavy carriage. In Russia, the post-drivers are frequently the heroes of the popular ballads, and for a reason which appears to have escaped Mr Erman, although in the first volume he gives an instance of the fact. Horses are not kept, as elsewhere, by the postmasters: they are obtained from the neighbouring peasants as soon as the vehicle is announced by the scouts that are on the look-out; and the individual to whom they are intrusted by their owners is of course the lightest, liveliest, and boldest young fellow in the family. These are the lads who leave their lassies sighing at their departure, to rejoice at their return; and these are the 'chartered libertines,' whose familiar intercourse with the world beyond their village gives rise to the incidents of romance and the plaints of poetry.

These, however, are Russian peasants; and here, as we approach the frontiers of China, we are more interested in the native Siberian Tartars. The Buraets live in tents constructed with poles meeting at the top, and felt hangings. Notwithstanding the usual projection of the cheek-bones, and the oblique and elongated eye, their jet-black hair, expressive eyes, and teeth of unrivalled whiteness, give them a pleasing look; and the cheeks of the women, notwithstanding the darkness of the skin, are tinged with a ruddy hue. Their dress, extravagantly rich, fits close to the person; and their hair descends from the temples in two thick braids, and is confined round the forehead by a fillet studded with mother-of-pearl, Uralian malachite, and polished coral. Although the fireplace of their tents is nothing more than a hole dug in the earth, with the felt mats and cushions on which they sleep ranged around it, some of their utensils exhibit all the refinement of civilisation. The steel-work of their riding-gear is beautifully engraved, and inlaid with plates of copper and silver. The silver bowls of their pipes (executed by themselves in the steppe) are adorned with reliefs, and inlaid with copper; while the stalk, for the convenience of carriage, is in two parts, closing so neatly, that the bore is air-tight.

At a certain horse station, within two or three miles of the frontier, are four regiments of Buraets and one of Tunguzes, armed with bows and sabres; and shortly after leaving this, our traveller found himself at the entrance of Kiakhta, the Russian emporium of trade with the Celestial empire. The Chinese town called Maimachen is represented by Mr Erman as adjoining the other—in fact separated only by a gate; but Pallas states that there is a distance of 140 yards, with two posts midway, one inscribed with Russian, and the other with Manchoo characters, to mark the frontier of the two empires.

On entering Kiakhta, which resembled a German village, with a single Cossack keeping guard with his drawn sword, Mr Erman 'found the houses of the merchants of the better class with stairs and balconies in front, and in some cases painted and embellished with architectural ornaments. Three camels met us just as we passed the gate, which were much longer haired than the Chinese camels that we saw afterwards. They belonged to the Buraets of Selenginsk, who were now thronging the streets on their way to a religious festival at Maimachen. Chinese traders, too, met us at every step. They wore

long gowns of black silk, fitting close to the body; their hats were of black felt, nearly in the shape of a crown, the part for the head forming a hemisphere, and having the brim turned up all round: a tassel of red silk falls down on each side from the top where there is a copper stud in the centre, on which a ball of some coloured stone or other material is fixed—this being the mode in which the several ranks are distinguished in China. The merchants here had rarely any such badge, and dare not, as I was informed, wear anything but a golden bulla, as they are accounted to belong only to the lowest class both in China and Russia. They all had cases for their ears, to protect them from the cold. These cases were angular and oblong, made of pasteboard, and covered with black silk, their open side fitting to the temples. Their thick silken skull-caps fell below the edge of their hats, and their heads were shaved, except upon the very crown, from which long queues hung down their backs. A long purse is attached to their girdles, just above the right hip, and in it they carry their tobacco and pipe, with its wooden stem curved at the lower end, and its diminutive bowl of brass. They were all hurrying over the boundary line, for every Chinese is obliged to be in Maimachen before sunset.'

When Pallas visited this place, it contained about 1200 inhabitants; and over each of its four gates there was a wooden guardhouse for the Chinese garrison, consisting of Mongols in tattered clothes, and armed merely with clubs. The Russian emporium was defended by a company of soldiers and some resident Cossacks; and these are all the precautions taken by the two governments for that 'protection of trade' which, with certain other nations, gives rise to vast standing armies that devour the profits. When Mr Erman passed through the southern gate of Kiakhta, the change 'seemed like a dream, or the effect of magic; a contrast so startling could hardly be experienced at any other spot upon the earth. The unvaried sober hues of the Russian side were succeeded all at once by an exhibition of gaudy finery, more fantastic and extravagant than was ever seen at any Christmas wake or parish village festival in Germany. The roadway of the streets consists of a bed of well-beaten clay, which is always neatly swept; while the walls of the same material on either side are relieved by windows of Chinese paper. These walls do not at first sight present the appearance of fronts of houses, as the roofs are flat, and not seen from the street. Indeed they are nearly altogether concealed by the gay-coloured paper lanterns and flags with inscriptions on them which are hung out on both sides of the way. Cords, with similar scrolls and lanterns, are likewise stretched from roof to roof across the street. These dazzling decorations stand out in glaring contrast with the dull yellow of the ground and walls. In the open crossings of the streets, which intersect each other at right angles, stood enormous chafing-dishes of cast-iron, like basins, upon a slender pedestal of four feet in height. The benches by which they were surrounded were occupied by tea-drinkers, who sat smoking from the little pipes which they carry at their girdles, while their kettles were boiling at the common fire. It is only the porters and camel-drivers, and the petty dealers—that is, in Mongols of the lowest class—who thus seek refreshment and chit-chat in the streets. Some of the poorer of the Russian Buraets occasionally resort there too; and both nations avail themselves of the niches or little chapels which are seen at the corners of the adjacent houses. These are dedicated to Buddha; and when the doors were open, we could readily distinguish the images of the saints within. Metal dishes, like those observed by us in the tents at Selenginsk, were placed before these divinities, and filled with consecrated water; and between them were pastils of vegetable extracts, and in the shape of slender yellow rods, which emitted no flame, but a bluish aromatic vapour; we saw reddish tapers, also of tallow, which were occasionally lighted by some passer-by. Similar tapers were burning against the door-frames or walls of the chapels, either in the open air, or in lanterns of various tastes.' At sunset, the travellers were quietly

* Two English miles are equal to three versts and a fraction.

and politely turned out of China, it being against the rules for strangers to pass the night in Maimachen.

The festival of the White Moon afforded him an opportunity of seeing the place in its holiday dress. On this occasion the Russians visited the Chinese town, and the procession made by the former was received by a troop of actors, who conducted the train to the house of the chief functionary with an incessant clatter of wooden instruments. Here they were received by a crowd of his Chinese guests, each of whom did his best to shake all the Russians by the hand; but the great man himself merely advanced a few steps towards them in a calm and dignified manner.

The repast was begun by a course of dried fruits and tea; and when the guests had tasted of everything—this being incumbent upon them as well-bred men—the tables were covered with more substantial food, in small saucers, which the initiated recognised as mushrooms, pheasants, pork, mutton, fish, and the gelatinous dainties of China. As course after course followed each other in long succession, the dishes were not removed, but the full piled upon the empty, till a lofty pyramid was constructed of gastronomical remains. When this second act of the feast was ended—by which time at least a hundred dishes had come upon the table—pipes, ready charged for smoking, were handed round to all the guests, with small glasses of spirits. This interlude did not consume much time, the bowls of the Chinese and Buraet pipes being not larger than a thimble; so that if one would enjoy the few whiffs it affords, he is obliged to conform to the Asiatic custom of swallowing the smoke, allowing a portion to find its way out again by his nostrils. The serious business of the feast was then resumed by the introduction of the third course, consisting of soups; and finally, pipes were again brought in, with a hissing, steaming vessel, containing an infusion of cabbage leaves, drawn off by a cock, and drunk out of teacups. In making tea, it may be said here, the cup is rather a teapot than a drinking vessel. A few leaves of tea are put into it, boiling water poured over them, and when the extract is ready, it is emptied into the saucer, from which it is drunk.

After dinner, their entertainer conducted them to one of the temples, where the offerings brought on the occasion of the New Year lay heaped up in hillocks at the feet of the idols. 'Among them were whole sheep without the skin, plucked fowls, pheasants, and guinea fowls, in their natural positions, and glistening with fat. There was a long table like the counter in European shops, running parallel with the threshold of the temple, so that it was necessary to go round the ends of it in order to get from the door to the statues. On this was now built up an absolute wall of offerings. Six sheep occupied the middle, and round them lay dressed meats and cakes of every kind. The whole was surrounded with an extremely elaborate structure of white dough, which was reared from the ground to the height of five or six feet, so as to be above the table. The dough or paste was formed into an open lattice-work, like that with which we sometimes fence our gardens; but the openings in the lattice-work were here filled with dried fruits and confectionery of the finest kind.'

When they returned into the street, it was already dark, and lanterns on long poles were borne before them, the troops of actors, as before, heading the procession, dancing, leaping, and capering, and making an incessant noise with cymbals and wooden drums. In going through the streets, it appeared that the New Year festivities had had a somewhat too enlivening effect upon a Mongol of the lower orders, who carried his audacity to the length of elbowing the great man as they passed each other. The criminal was immediately laid hold of by the police, pushed against the wall till the procession passed, and an iron chain thrown round his neck preparatory to his being carried off to prison. This offence against politeness appeared to be regarded with great indignation by the crowd, who admonished the prisoner in an angry tone, each person ending the oburgation by putting his fist to the man's nose. The procession now visited the houses of the principal merchants, whose servants welcomed them

by throwing lighted rockets and crackers over their heads. In the houses they found a banquet resembling the one they had already partaken of; till, as the night advanced, the solids diminished in quantity, and at length the treat was confined to confections, tea, and pipes. Such was New-Year's Day in China.

The merchants of Maimachen, we are told by Pallas, come chiefly from the northern provinces of China. Each has a partner at home, who, at the end of a year, brings a fresh cargo of Chinese commodities, and relieves the other, who returns with his Russian purchases. The town resembles in one respect a great convent—all the inhabitants being men; for the Chinese policy strictly prohibits their women from having even the slightest intercourse with foreigners. The commerce is necessarily a trade of barter, for the Russians are prohibited from exporting their own coin, and the Chinese have no coin to export. The former find it more advantageous to take goods in exchange, than bullion at the Chinese standard. The Celestial merchant visits the warehouse of the Russian trader in Kiakhta, and after selecting from his stock, goes into the house with him, and adjusts the price over a cup of tea. They return to the magazine, where the goods are not only sealed, but a confidential person left in charge of them; and then adjourn to Maimachen, where the Russian selects in his turn, and carries back with him his purchases.

The want of a circulating medium is supplied, according to Mr Erman, by brick-tea, which is a mixture of the spoiled leaves and stalks of the tea-plant with the leaves of some wild plants and bullocks' blood dried in the oven. It is divided into pieces weighing from three to three and a half pounds. 'The Manchos themselves never make use of this production, but to the Mongolian nomades in China, to the Buraets and Kalmuks collectively, to the Russian peasants south of the Baikal, and to most of the Siberian Tatars, it is become as indispensable as bread in Europe. Every brick, or kirpich, contains sixty or seventy portions, because the infusion made with it is mixed also with rye-meal, mutton fat, and with kujir or búsun—that is, salt from the lakes in the steppes. The Russians purchase an immense quantity of it from the Chinese; but besides, the kirpich or brick of tea is the money unit and standard of value, in which the price of every other kind of exchangeable property is expressed.' When it is necessary to pay fractional parts of this strange money, they are cut off by the Russians and Buraets, measuring by the eye; and the Chinese never object to take such pieces in payment.

From Russia, we are told by Pallas, the Chinese receive furs and peltry of various kinds; and the demand for these articles is so great, that they are in part supplied even by England, which sends the produce of Hudson's Bay to St Petersburg. Cloth is another staple; the coarser sort of Russia manufacture, the finer English, Prussian, and French. Then there comes a miscellaneous list of rich stuffs, velvets, coarse Russia linen, leather, &c. with camels, horses, horned cattle, and dogs for the chase. In return, the Chinese give raw and manufactured silk, although the exportation of the former is prohibited under pain of death; raw and manufactured cotton, tea, porcelain of all sorts, Japan ware, rhubarb, and numerous other articles. Rhubarb is a monopoly of the Russian government, and is brought to Kiakhta by Bucharian merchants.

We have left ourselves no room to follow Mr Erman in his journey eastward to Okhotsk; but we cannot refrain from giving another and concluding picture of native Siberian life. The scene is in a yurt of the Tunguzes, consisting of a single square room, with a flat earthen roof, and a fireplace of beaten earth. This place was occupied, besides the traveller, by ten members of the wandering family of Tatars. 'We remained in the yurt with the women and the Yakutian servant of the family, who served me as interpreter, for Revyákin spoke only the Yakutian fluently. The women of the house and their unmarried daughters now sat down together on the floor to their work. They were occupied to-day with the last cares of winter, for they were sewing the cover for a

birch tent, and were mending the men's reindeer clothing, the *torbasas*, or water-tight boots (here called *adri*), and other articles necessary for travelling. In the afternoon the girls went to the river hard by to cut ice, which was in part melted in the kettle, and used for cooking, and a part of it was thrown into a wooden vessel near the fireplace, and kept for drinking. When the work was finished, they began to employ themselves in the yurt with the business of decoration. In an elaborately-made box of birch bark they had treasured up some studs of brass and lead, beads, and old brass springs. These last were now cut into small pieces, and strung with the studs and beads so ingeniously, that a very pretty ornament for the head was made with very poor materials. The Yakut had lent the girl his assistance in making this band at her earnest request. They then amused themselves by playing cards; and at supper the black bread to which they were treated by the traveller was devoured as the greatest dainty along with the soup and meat. Some singing followed, to pass the time; and then this primitive family sought their berths for the night, each person being provided with a lighted pipe.

It will be seen that we have not meddled with the scientific information interspersed throughout these diversified volumes; but this, although not of popular interest, is unquestionably the most valuable portion of the work.

ARTIFICIAL BARRIERS TO SOCIAL INTERCOURSE.

We are of opinion that much agreeable and profitable social intercourse is prevented by a want of moral courage in adopting a simple style of entertaining one's friends and acquaintances. Let us look around, and what do we find to be the general state of intercourse between friends and acquaintances in the middle and upper classes of a commercial community? On the one hand, we see an entire abstinence from all social intercourse (except, perhaps, with immediate connexions), arising from economical motives, founded on the impossibility of complying with the supposed requirements of society in this matter. On the other, we find individuals giving, once or twice a year perhaps, an expensive and formal dinner party, or a stiff evening entertainment, at neither of which does any one feel himself at ease; where one is in the midst of a most heterogeneous company, gathered together without any earthly reference to fitness or amalgability, and from which one at last escapes, thankful to find himself again at his own quiet fireside—inwardly vowing that nothing shall ever again tempt him to exchange its genial precincts for any such vain and profitless visiting. During the winter, Mr and Mrs A— have been invited to dinner by Mr and Mrs B—, or the young people have had 'the pleasure of their company requested,' &c. by the C—s. The A—s consequently feel it incumbent on them to clear off the debt supposed to be owing to the said B—s and C—s, by inviting them in return; and in order to have a general clearing off of scores, they bethink themselves of all and sundry from whom they have received civilities during the past six or twelve months, and without any consideration whatever as to the harmony of the ingredient members of the company, a great crowd of persons, for the most part utterly unknown to each other, are uncomfortably packed together, the house is turned topsy-turvy for a few days, a great deal of money is foolishly squandered, no comfort or satisfaction has resulted to anybody, and when the affair is over, the givers of the entertainment generally congratulate themselves that a year at least must elapse before they have again to undergo similar trouble and expense. For months after this event, the A—s would as soon think of flying as of asking any of the B—s, C—s, or D—s to drop in upon them in a quiet way to spend an evening. With such persons there is no medium between a formal tiresome party and an entire abstinence from all visiting whatever.

The fact is, the true secret of genial and improving social intercourse—of anything at all approaching even to the name—is but little understood, and still less acted upon. The very words 'visiting' or 'meetings of friends' suggest to most minds the idea of expense, domestic inconvenience, anxiety, and trouble. Why should this be so? All kinds

of social intercourse ought to be associated with the most pleasing ideas. They ought to be easily attainable, and readily arranged, and should entail little or no disarrangement of the usual domestic routine. When will a few rich persons encourage their less wealthy brethren by systematically adopting in their entertainments a severe and almost Spartan simplicity? Such a simplicity would do them infinite honour, by tending to emancipate those less favoured by the gifts of fortune from the supposed necessity of needless profusion and uncalled-for expense. If such examples were to become prevalent, the consequence would be, that the apparent inequalities between rich and poor would be much softened down—there would be an absence of that painful, but irrational feeling, which constantly haunts many otherwise amiable persons, lest their mode of entertaining those whose incomes are ten or twenty times larger than their own may not be quite *comme il faut*—we should have less thought taken about mere eating and drinking, and more about matters of higher import.—*From the Companion, a series of pleasant rational Essays in the Manchester Examiner.*

SONNET.

WHAT felt the world's survivor when the bough
Was brought him by the home-returning dove?
Joy throbbed his heart, and Hope swelled up above
The fears that in his soul had lurked till now,
In spite of all his faith. But when the ark
Was rested by the waters' sinking flow
Safe on the mountain, and the patriarch
Gazed on the shoreless ocean lessening slow,
Unruffled in the noontide's golden glow,
Or in the calm of midnight rolling dark,
Though thickly sprinkled with the gems of heaven;
Sure when the ark sat on that dreadful sea
Alone, no feeling in his heart could be
But sorrow for his kindred unforgiven.

F. T.

WALKING.

Of all kinds of exercise, walking is that which is the most universally attainable, and at the same time the best. Calling so many muscles into action, and especially those of the lower extremities, of which the circulation is apt to be more languidly and imperfectly performed, from the degree of resistance presented by the force of gravity to the return of the blood to the heart—calling, moreover, so much of the moving apparatus of the body into reciprocal and balanced action, flexor and extensor muscles being correspondingly exercised—walking is undoubtedly the best of all exercises for the purposes of health, independently of its secondary, and by no means little useful effect, of carrying the respiratory organs into the freer and purer air, and exposing the system to the extraordinary and (at least in the colder and temperate countries of the earth) the healthful influence of the direct rays of the sun. The degree of the exercise must of course vary with the age, condition, and habits of the individual; but the degree of exercise that is in most cases serviceable is generally much underrated. Two miles a day is the minimum distance which a person of moderate health and strength ought to walk. If the powers of the system increase, or are stronger to begin with, the minimum ought to be four miles. The object should be, in most cases, to walk the four miles in an hour; and the invalid, beginning, perhaps, by walking a mile, or a mile and a half, in an hour, might gradually increase his rate of walking until he had accomplished this end. Quick walking calls more muscles into action than slow walking does, and is therefore better. The muscles of the back and trunk, neck and arms, are comparatively very little used in slow walking. A person can hardly walk quickly without using them to a very considerable degree. It is a maxim so sound and important, as to deserve frequent repetition, that the greater the number of the muscles used, the more advantageous will be the exercise.—*Robertson on Diet and Regimen.*

HAUNTED PEOPLE.

Young folks are still awed, and old folks either puzzled or amused, by the veracious and circumstantial narratives about seen and unseen supernatural agents; and such books as Mrs Crowe's 'Night-side of Nature' strengthen in some, who would be ashamed to admit it, early impressions, which, though often combated, yet seem too strong and well-founded to be got rid of on all occasions. But notwithstanding the extent to which this actual ghost secretly influences those whom some would deem insufficiently reflecting people, still I believe there is an ideal ghost which affects even many of the thoughtful and educated to an extent of which they are not always conscious, and which is, however, one of the greatest scarecrows to happiness that it is possible to conceive. This ghost is sometimes created by young folks for themselves, and often, too, well-meaning but injudicious friends are the first to raise it; but whatever be its origin, its existence is often unnoticed till it has got such a hold of us, that it costs a world of trouble to get rid of it. Now though most people are familiar with it under various names and shapes, still it may not be useless to add another to the many phases under which it has appeared in print. Some call it the 'fear,' and others the 'love,' 'of what the world would say,' many term it 'emulation,' and more 'envy.' In union with the idea which suggested this paper, I might call it 'the ghost of imitation;' but as names are bad mediums for conveying one's thoughts, I shall leave my readers to form their own nomenclature.

To understand, then, what I mean, reflect for a moment, and consider if there be any one whose acts, whose position in life, whose abilities, whose accomplishments, whose tastes, whose manners, or whose anything you often involuntarily draw into comparison when about to form or act on a judgment of your own. If there be any one the remembrance of whom rises to your mind spontaneously when thinking on a particular subject, so that, before coming to any determination, you regularly fancy to yourself how would he or she act in these circumstances, that person, reader, is your ideal ghost; and the effect of its haunting you is more destructive to your happiness than all the other ghosts you have ever heard or read of. Have you the desire or the necessity to become an author, and in choosing your style, do you think of some popular or eminent writer whose works have first roused you to action, and whose ideas, whose incidents, and whose plans of composition have taken such hold of you, that you almost involuntarily choose such subjects as he has written on; and though shame of being a paltry plagiarist may compel you to use a different, and most likely inferior language, yet in a difficulty you feel your memory groping through your model's works for an idea instead of searching for it within your-

self—that author is your ghost: he has haunted you till he has frightened you out of your self-reliance; and the composition you have so laboured at will only confirm your apprehensions of disappointment and annoyance.

To take a more trivial instance: do you feel disinclined to go to church on a Sunday, and still do go, not from conviction of duty, but from reluctance to draw upon yourself the notice of some one you respect?—that some one is a ghost, who has terrified you out of your own good sense; and though you may meet their eyes with self-satisfaction, and without any of that self-condemnation which your absence would have filled you with, still you can't feel that you have acted aright; and no lasting or solid pleasure can result from your mere escape of censure. Do you feel inclined to lie long in bed in the morning, and while so dawdling, think what such a one is doing, and how busy he or she is, and how they would smile (to say the least) if they could look in on you, and see you so lazy?—that such a one is a ghost that will continue to haunt you so long as you have any self-respect left; and unless you lay it by activity and resolution, it will be a constant source of uncomfortableness and unhappiness to you. Is an opportunity of doing what you feel to be a charitable action thrown in your way, and after hesitating about doing it, you feel impelled to it by either the dread of shame from some one seeing you omit it, or the less ignoble motive of bethinking yourself what some one whom you admire would do on such an occasion?—these individuals all haunt you: and I think you can now understand what I mean by a person's being haunted. But, say you, don't all wise people tell us that example is better than precept; and that when we find a person who laudably surpasses others in some particular, the very best thing we can do is to try and do what that person is doing, and so aim at that merit which all commend? True: wise people do say so; but like most of the sayings of wise people, it requires a wise person to understand it. Example is an excellent method for showing *what* can be done, but a dangerous one for pointing out *how* that is to be done, or rather for people to adopt in trying to find out *how* a thing is to be done. Example may show us the great things a man can do; but if we aim at doing similar things, we must find out mainly by ourselves *how* they can be done by ourselves, and not trust to our imagination, by supposing that others may have done them in a particular way, and therefore that we may do them if we follow in that way.

This is a distinction which, if not carefully attended to, will convert what might have been your best friend into your most constant and dangerous foe; and I shall give you my reason for thinking so. It seems to me that though any attentive beholder may clearly understand the external results of a person's conduct, still he must form a very imperfect estimate

of its various motives and causes; and therefore that *he* is not likely to succeed who, when setting about pursuing the same conduct, first *imagines* to himself the motives and causes of it, and then tries to imagine himself influenced by them. Now reflection I think may, and I am sure experience will tell you, that though you have good reason for believing the conduct you aim at was such as you saw and believed it to have been, still, that you have no reason for being sure of the motives and causes of it; and though you did feel sure of them, yet that at least the internal, if not many of the most important external circumstances, qualities, and feelings of your model are so completely beyond your observation, that if you attain the same conduct, and so the same end, it must be by means widely different. Of course I take it for granted that you are desirous of self-improvement, and anxious to stand high in your own estimation, as well as in that of your friends; and that, not content with guiding your actions by the impulse of imperative routine, or the necessity or profitableness of occupation, you seek some principles whereby to satisfy yourself that the life you lead, though sometimes monotonous, and less absorbing in its enjoyment than you once supposed it would be, yet contains the materials of as much contentment, if not happiness, as a reasonable man should desire. Now you are aware that most of the powers which men display in the world are in great measure the result of long habit and exercise, and therefore that if it be necessary or desirable for you to cultivate in an especial degree some of those powers, you must pay less attention to others. Owing generally to the incompetency or necessities of our care-takers in early life, we often find that our energies have been directed, or have directed themselves, in some channel, a confinement to which could not lead to a reasonable share of happiness; and therefore when we find others whose energies have received a different direction apparently enjoying and conferring more happiness than ourselves, it naturally makes us wish, and perhaps strive, for the possession of similar powers; and it is here that the ghost I alluded to generally rises. Instead of calling to mind the length of time we have been acquiring the power we possess ourselves, and so inferring the difficulty of acquiring the new ones, we think (or rather we don't think, but we act as if we did think) that the apparent ease with which the possessor exerts them is naturally inherent in the subject-matter of those powers, and therefore that close attention to their exertion will secure us the secret. The consequence is, that our attention being absorbed in *what* is done, we overlook *how* it is to be done, or we trust to our imagination for informing us of it; whereas, in truth, far more thought and attention are requisite to ascertain the latter than the former.

For instance, you wish to become agreeable in company, and to profit and please your audience. You hear a friend who converses on the topics of the day tell stories and crack jokes in a way which interests and amuses every one. You increase your acquaintance with those or similar topics; you furnish yourself with a lot of stories and some good jokes, and begin to try your powers; but you find that people listen to you with serious politeness, and rarely give you more than a smile of protecting condescension. You feel that you have related the fact, or made out the point of your story, as well as your friend might have done, and you think that people might fairly have laughed at the really good joke you have told; but there is still a something wanting that convinces you of a failure, or nearly so, and you are

inclined to despair of attaining your wishes, and to give up by saying, 'I've no natural talent that way.' Now I think you have a natural talent that way, though it may not be as great as that of your friend, and your failure arises not from the want, but the misemployment, of your natural talent. I suppose you may be delicate in body, or at anyrate far less strong and active than some of your companions. You hear them exulting in the enjoyment of a long walk or some vigorous exercise; and you see by their fresh looks and high spirits that it has done them a deal of good; and you, feeling weak and spiritless, determine to improve yourself the same way. And how do you set about it? I can't suppose you so thoughtless or vain as that at your first trial you would attempt to do exactly the things your friends have done: for example, that you, unaccustomed to walk one hour continuously, should attempt to walk six; or that, being in the habit of rowing across the pond, you should essay ten miles up the most rapid part of the river against time; but I take it for granted that you set to work on the prudent plan of daily increasing your present amount of exertion, until you find yourself gaining that strength and good heart which enables you to hear your friends relate their feats without feeling any inclination to give up your own habits and adopt theirs, or which at most raises an inclination to try and emulate them the first convenient opportunity. Well, then, is it not strange that you, who act so prudently in your own physical education, act so imprudently in your intellectual and social? Circumstances, perhaps, or want of self-reliance, may have conspired to make you less entertaining than you wish to be; and when you find a friend, by the mutual action of practice and inclination, becoming the usual centre of agreeability in a room, how does it happen that you entertain the idea, that by a sudden effort you can produce an effect similar to what he does? You were not so thoughtless with respect to the walking; and be assured there is need of still more thought, still more observation, self-reliance, and perseverance, to attain the power of talking in a manner on which you may reflect with satisfaction.

What, in the name of goodness, made you fancy that your friend's amusing and entertaining powers depended on his knowledge of certain facts, and his remembrance of certain stories and jokes? Can you not call to mind how the conversation happened, as it were, by chance to turn on that subject which introduced his knowledge and his fun so well? Do you not recollect the agreeable humour in which his listeners were before he ever sought a smile from them? Whether it was the extent of his powers or his good fortune which thus enabled him to take advantage of the circumstances, you remember, however, that they did so exist. And can you then wonder that your stories and information, though perhaps in themselves superior to any of his, are nothing compared to them in effect? Can you be surprised that even while telling your story, which perhaps you commenced with some little spirit, that your courage deserts you, and failure begins to stare you in the face, and you feel detected, as it were, in a contraband attempt to be agreeable, and find it almost impossible to pass cheerfully to some other topic, and so cover your defeat? You judged rightly as to *what* was to be done, but wrongly as to *how* it should be done. Your desire to amuse as much as your friend was laudable and judicious; but to attempt to do so in the same apparent way, and by the same apparent means, was most injudicious, and has been the secret of your failure.

He may have felt himself really interested in the subject of conversation, or amused at the thought of his story, long before a word passed his lips, so that his speaking was only a vent for the load that was on his mind; or he may have scanned his listeners so accurately, as to know what best suited their feelings at the time; but in any case, you may be sure he had a clear, definite object marked out for himself, and to that he went direct, without thinking of what any other would do in his place. On the contrary, as soon as you thought of your subject or your story, you also raised your ghost, and fancying to yourself how he would have spoken or acted, you begin accordingly; and the moment any doubt of your efficiency crosses your mind, fancy suggests something else your model might have done; and once the haunting takes effect thus on you, it pervades you so entirely, that you are frightened out of your own common sense, and it is a general relief when some one else engages the attention of the company.

Supposing, however, that you did manage to get listened to with attention, you have gained credit for what is not your due; for if your imitation has depended on memory, you are only a parrot; while if, as is most likely, it has resulted from imagination, all that is correct is matter of chance, and what is incorrect is your own fault. In short, your model, when in action, is a reality, while you are a sham. You are haunted, and your model is not. If, then, you are ever in this condition, these remarks may induce you to think of freeing yourself from it. Whenever you wish to effect any object, consider first well what it is, and then what means you have certainly within your reach to effect it; and having some definite unshakable ideas on the subject, then try, by way of experiment, how you can, unaided, work out those ideas. Take accurate heed of your success or failure, with the conviction that either of them is attributable to yourself alone, and according to the event, one way or other, let your next experiment be made; and as each trial will give you fresh confirming, you will soon find you have enough, and perhaps even more labour than you will be willing to undergo, in recalling to mind the lessons you have taught yourself: but the practice will soon render it easy; and as you will thus find that you have perhaps more knowledge in your possession than you have occasion for, you will not have time to be haunted, and the ghost will be laid most effectually. Of course when I say one ought to be independent in choosing the means for any end, I don't dissuade you from seeking all possible information as to the advisability of those means ere you adopt them. On some subjects you may get useful information in books, on others you will gain it by the oral advice of friends (who possess the advantage of being able to explain difficulties); but in all cases, you, and you alone, should judge for yourself whether the means thus laid before you are best suited to yourself and your capabilities. If you lay aside this responsibility for a moment, when by a little energy you could have exercised it, faith usurps the place of conviction; imagination warps, if it does not subvert, reason; your plans of action, instead of being solid realities, based on knowledge, become but the shadows of independent thought; the giver of the counsel, or the creator of your motives, becomes a ghost haunting you every moment that fancy works; till at last some stern reality wakes you up, perhaps only in time to find the extent of your self-deception, and the total annihilation of the hopes which set your

reason asleep. How many useless anxieties, groundless enmities, and impossible aspirations might we avoid by this self-dependent, ghost-laying determination, to rely mainly on our own thoughtful experience of our own capabilities! How much would it increase our faith in, and decrease our dependence on, our fellows, did we thus accustom ourselves to judge them solely by what we are actually sure of as to them, and not by what fancy suggests! Then might we find how little others can injure or assist us, if we do not make ourselves dependent on them; and once that we have tasted the labour-won pleasure of living from ourselves, self-respect will make us continue the responsibility; and if ever we have derived gratification from being useful or agreeable to others, we shall do so then more constantly and certainly, as vanity, the food of ghosts, will have disappeared, and benevolence, the basis of originality, will be the groundwork of our character.

BYGONES OF THE BACKWOODS.

A REMINISCENCE OF THE MIAMI EXPEDITION.

It is now a good many years—so many, indeed, that we are hardly inclined to acknowledge having accompanied the expedition in connection with which the circumstances we are about to relate took place, as we are still upon the list of bachelors—since the United States government found it necessary to despatch a considerable military force, under the command of General Wayne, to repress the incursions of the Indians who occupied the hunting-grounds contiguous to the north-western frontier of the territory of the republic. The troops consisted of a couple of battalions of regulars and a large number of volunteers, who joined them from their respective townships as they passed along towards the point of concentration—each of the states exposed to the ravages of the Red Men contributing its quota. Having arrived near the scene of action towards the close of autumn, the commander encamped on the northern bank of the Ohio river, within a short distance of the line which bounds, on the western side, the state which bears the same name, and resolved to spend the winter in the discipline of his new levies, with the view of taking the field in the highest possible state of organisation early in the ensuing spring, and then deciding the matter at a blow. The result attested the wisdom of this course and the accuracy of his calculations, as the campaign may almost be said to have been confined to the decisive victory obtained on the Miami of the lakes.

On a fine evening, some weeks before the force had arrived at the place where it subsequently took up its winter-quarters, the sounds of angry altercation might have been heard issuing from a group of four individuals, who stood in front of a block-house in a recently-cleared patch of ground, at no great distance from the town of —, in the state of Tennessee. One of the four was an Indian; of the others, two were young white men, of slender, but hardy and active make; whilst the third, likewise a white man, was evidently the senior of his companions by probably a score of years, and the possessor of a frame whose towering height and brawny and muscular proportions contrasted strikingly with the light and agile forms of the other individuals of the group. The contrast presented in this particular, however, was not more striking than that which existed between the gloomy and vindictive scowl which lowered on his naturally sombre countenance, and the open and honest frankness displayed in the features, though now lighted up with indignation, of at least that portion of the remainder of the party who were his kin in point of colour.

'I tell you what, my lads, exclaimed the ominous-looking individual in deep and threatening tones, 'one

word for all: the shooting-iron's mine by lawful barter; and what's mine I mean to keep, until I meet a better man than myself to take it from me—and I reckon that's neither Charley Simmonds nor Chingowska.

'Either of us is as good so far as manhood goes,' replied the young man named as Charley Simmonds; 'and the worst of us is far better, if honesty is to be taken into the account. As for the barter you speak of, I suppose it is about as lawful an affair as that with the Green Mountain carrier whom you persuaded to swap his team of oxen against your horse, that he never saw, on your swearing that he was free from disease, leaving him to find out afterwards that the beast had broken his neck down the Sandstone Cliff a week before.'

'I make some allowance for your feelings, Charley,' rejoined the former speaker, 'in regard of my having got inside you in the good-will of Sally Benton; but I don't usually bear so much stirring up, and take it so quietly; so leave off while the play is good, if you're fond of yourself.'

'Keep less talk about Sally Benton!' exclaimed with great warmth the white man who had not hitherto spoken, and who was brother to the young woman referred to. 'She does not like a bone in your body; and if she did, her friends might like to know whether a man that deserted his wife and three children a couple of years ago in Jefferson county is any acquaintance of yours, or whether you ever heard of a sheriff's officer who was found about the same time with a hole through his head that never came there by nature, and that was as like one that a piece of ragged lead would make as the description I got of one Sam Staples, who made himself rather scarce in that clearing just after the occurrence, is like the man that calls himself Bill Tuckett. My ears were not closed when I was down east last fall; so take yourself along more quietly, and look out for a wife somewhere else than in the family of Sally Benton, Master Bill Tuckett, or Sam Staples, whichever you choose to call yourself.'

Astonishment, consternation, and rage, were successively depicted in the countenance of the man calling himself Bill Tuckett, who had but recently come to settle in that neighbourhood, representing himself as an unmarried man. For several seconds he glared in silent passion on his accuser, and seemed for a time as if about to rush upon him and rend him in pieces on the spot. After a mighty struggle with himself, however, he succeeded in mastering every external appearance of emotion, and even smiled grimly as he replied, 'If you had a beard upon your face, young fellow, you might find me dangerous to be talked to after that style. Meantime, I don't like to have my dander ris by a boy that's only fit to be whipped by his mother; so I wish you good-night.' So saying, he turned on his heel and entered the block-house.

As he passed through the doorway, Charley Simmonds called aloud after him, 'I say, Bill Tuckett, don't suppose you are going to make your own of Chingowska's rifle so easily. When we return from the west, you'll hear more about it.'

No answer was returned. After a brief pause, the young men, with their red companion, left the spot, and proceeded in the direction of the town.

Before they were quite lost to view in the distance, the gigantic frame of Tuckett again appeared in the doorway. The blackness of the thunder-cloud brooded on his countenance as he gazed on their retiring forms in silence for some moments. Then fiercely shaking his clenched fist towards the quarter they had taken, and perhaps unconsciously giving audible expression to his feelings, he exclaimed, 'Ay, when you "return from the west;" but it shall be my care that you *don't* return. No half-measures will answer now. The stories that your friend has taken the trouble of collecting down east will cost you all dear out west. 'Tis your blood or mine!'

Had the feelings of the soliloquist been less excited by his theme, he might have detected at this moment a rustling in the underwood, in which the block-house was partly embosomed, which could not have proceeded from the wind, as not a breath of air was stirring. His facul-

ties, however, were wholly absorbed by the subject of his passion, and after a brief interval, he again disappeared in the house. The next moment a young lad, brother to Charley Simmonds, and his junior by three or four years, emerged from the thicket, and keeping the rear of the building, made his way in the same direction as that already pursued by the other members of the party. He had accidentally been passing at a short distance from the spot, when he was attracted by the sound of voices engaged in angry altercation, as already described, when his youthful curiosity stimulated him to approach and listen, availing himself of the concealment afforded by the bushes. He had been about to withdraw, when Tuckett reappeared, and uttered the ominous language just quoted, every syllable of which, amid the stillness and solitude of the place, was borne distinctly to the ears of the listener. He determined of course to take the earliest opportunity of informing his brother of the circumstance, and placing him and his friends on their guard against any treachery that Tuckett might contemplate. A slight alteration of their arrangements, however, of which he remained in ignorance until too late, rendered any communication between them impossible.

All the individuals whom we have introduced to the reader were included among the volunteers who were to join from that township the expedition under General Wayne. The comparatively tender age of the younger Simmonds was not considered a fact of sufficient importance to prevent the gratification of his wish to be allowed to make one of their number, as—though his strength was not yet sufficiently matured for a hand-to-hand struggle—like most of the frontier lads of his years, he was already familiar with the crack of the rifle, and had more than once drawn a trigger on active service. Local circumstances had induced the arrangement, that the party should start for the place of rendezvous in two separate detachments, the first of which, including the four first-named individuals—for the Red Man belonged to a friendly tribe, and spent nearly as much of his time in the settlement as on the prairie, and consequently accompanied, as a matter of course, his white friends on the expedition against their common enemy—was to set out on the following morning; and the second, to which the younger Simmonds was attached, in the course of the subsequent week. The altercation we have described, however, rendering the young men little disposed to hold companionship with Tuckett during a march that must occupy from seven to ten days, they resolved on starting that very evening, so as to keep constantly in advance of the party in whose company he was to travel. Accompanied, therefore, by their Indian ally, and some two or three of their more intimate associates, to whom the project was communicated, the little band commenced their journey, and had accomplished nearly a score of miles, when they halted to 'camp' for the night. Of this anticipation of their original plan the brother of Charley Simmonds was in ignorance, until, on seeking him, for the purpose of acquainting him with the threat which Tuckett had made use of, he learned that he had already departed.

It is necessary here to explain the original cause of the quarrel of which we have described a part. In the summer of the preceding year, the skill and daring of Chingowska, at extreme peril to his own life, had saved that of an English gentleman who was hunting on a distant prairie, when under the very tomahawks of half-a-dozen warriors of a hostile tribe. The grateful Englishman would have been profuse in his liberality towards his gallant deliverer, but the latter would accept of little in the shape of reward. One article, however, in the possession of the former had excited his admiration, and it was evident he regarded it with a longing eye. This was a London rifle, of superior finish and workmanship, which carried a ball half as large again as the ordinary American rifle; and which, sending the deadly missile to the mark with equal accuracy, was certain to bring the game to the ground with a mortal wound at a range so great, that the very best weapon the Indian had ever seen in use on the frontier before would fail to break the skin at

a similar distance. Of course the gun, with the bullet-mould, and every other necessary implement connected with it, at once became the property of Chingowska, with the addition of a quantity of powder and lead, and a considerable sum of money. Of the latter, the unfortunate Red Man, like most of his race when similarly circumstanced, spent a part in dissipation among the settlements, and suffered himself to be speedily cheated of the remainder. Fully appreciating, however, the value of his rifle, and its vast superiority to anything of the kind to be met with in the backwoods, he resisted every inducement to part with it in the way either of purchase or exchange, though numerous and tempting offers were made to him upon the subject. But poor Chingowska had his weakness. The fatal vice, the parent of all the follies, misfortunes, and crimes which have almost swept the once noble race to which he belonged from the face of the earth, is a fondness for strong drink. To procure this, Chingowska had already parted with everything but his beloved rifle. On the evening previous to that on which the dispute we have described took place, Tuckett invited him to his block-house to partake of some rum. The unsuspecting Indian readily fell into the snare. His treacherous host plied him with drink until he sunk in utter insensibility upon the floor; and on his restoration to consciousness at an advanced hour the following day, he was informed, in reply to his inquiry for his rifle, which had disappeared, together with his bullet-mould, that he had agreed the previous evening to dispose of it in barter for the rum which he consumed, and a worthless old shot-gun, which his deceitful entertainer now tendered him. Of course the indignation of the poor defrauded Red Man was excessive; but as Tuckett was prepared for this, and treated his remonstrances with contempt, he was compelled to leave the place without his prized weapon, and carry his complaint to his friends Simmonds and Benton, with whom he had often traversed the forest and the prairie either in the pursuit of game, or on the trail of the hostile Indian. In company with them, he had the subsequent fruitless interview with Tuckett, the particulars of which have been detailed.

On the following morning, the remainder of the first detachment of volunteers commenced their march, and reached General Wayne's encampment in due course, the half-dozen who preceded them having arrived on the previous evening. At the appointed time, the second party, including young Tom Simmonds, started for the camp, which they reached without the occurrence of any event essentially connected with the thread of our narrative.

Of course the first inquiry of Tom Simmonds on his arrival was for the quarters of his brother. What was his consternation on being told in reply that his brother and Chingowska were condemned to death by a court-martial for the murder of Dick Benton, whose dead body had been found in the wood a couple of miles beyond the lines, and that the sentence was to be carried into execution at daybreak on the following morning!

On recovering from the first stunning shock of the intelligence, he flew at once to the hut in which the condemned men were confined. On attempting to enter, he was repulsed by the sentry, and informed that none could be admitted without an order from the officer who had presided at the court-martial before which they had been tried. To seek him out, and obtain the necessary order, occupied a considerable time, and fearfully abridged the period which intervened before the hour at which the sentence was to be carried into execution; reducing to narrow limits, indeed, the space in which alone any effort could be made to avert the frightful doom. It is unnecessary to say that the idea of the remotest possibility of his brother's guilt never once entered the mind of Tom Simmonds.

We need not dwell on the meeting of the brothers. Though the heart of each was full, there was no time for the indulgence of idle lamentation or useless expressions of sorrow, if any exertion was to be made in behalf of the condemned. Tom was soon made acquainted with all the circumstances of the case. The body of Benton had been found by some of the men who had gone out in

pursuit of game, in the edge of a dense wood, cold and stiff, having evidently been lifeless for several hours. It displayed two wounds, the least of which was mortal. One was a bullet wound right through the body; the other was a tomahawk wound in the head, so deep, that it was evident the axe must have penetrated the skull of the victim to the very eye of the weapon. What caused the names of Charley Simmonds and Chingowska to be first connected with the murder was the fact, that immediately after the discovery of the body, a rumour was found to pervade the camp that, on the very night previous to that day, a violent quarrel had taken place between them and the deceased, which had been overheard to result in mutual threats of violence and revenge. This was considered sufficient to fix suspicion on them, and justify their being placed under arrest. At the examination which ensued, the accused men both solemnly denied not only that an angry word had ever passed between them and the deceased, but that they had been beyond the lines on that side of the camp since their arrival at all. At this stage of the proceedings, however, one of the party who had discovered the body produced a strip of fur a few inches in length, which had been found within a few feet of the spot on which the murder was committed, and which, on being now examined, was found to correspond precisely with a spot from which a similar piece had evidently been recently torn on the hunting shirt of Charley Simmonds, the edges of which were trimmed with fur of a similar description. In fact no doubt could be entertained that it was the identical piece which had been torn from his garment; nor did he attempt to question the fact himself, though quite unable to explain how it came to be found at the scene of the murder. Another of the men now produced a wampum belt, which he stated he had found in the wood not twenty yards from the same spot, but which he had not thought of connecting in anyway with the tragical occurrence, until the circumstance of the strip of fur suggested the idea. A single glance at the Indian served to discover that his wampum belt was gone, and his knife and tomahawk suspended from a canvas girdle, which a score of witnesses were ready to prove had not been the case on the preceding day. Poor Chingowska at once recognised his belt, but could furnish no other account of its disappearance from his person than the statement that, having obtained rum from some of the men on the previous evening, he had fallen asleep in a state of intoxication, and missing his belt on awaking, had substituted the canvas one which he now wore.

The result of the examination was the appointment of a court-martial for the trial of Simmonds and his red friend for the murder. The circumstances above detailed were adduced for the prosecution, and the prisoners were called on for their defence. It was simple, and consisted of a denial of having ever had a quarrel with the deceased, and of having been in the vicinity of the scene of the tragedy at all. The rumour of the quarrel having been traced to its source, it was ascertained that Bill Tuckett had, on the night previous to the day on which the murder was committed, observed to a comrade that he feared some bad work would follow from the bitter language and violent threats which he had overheard proceeding from the occupants of a hut, which he pointed out, as he was passing along to his own quarters. He did not appear at the time to know who the parties were by whom the hut was occupied, but said that the voices seemed somewhat familiar to his ear, though, from the excited tone in which they spoke, he could not recognise them with sufficient distinctness to name the speakers. Being called on for his evidence at the court-martial, he deposed to precisely the same effect, declining to swear that the voices he heard were really those of the three individuals in question, but pointing out the hut which they had occupied as that from which the sounds had issued; the prisoners themselves admitting that they and their late unfortunate comrade had been its sole occupants from nightfall until sunrise. In support of their denial of ever having had a quarrel, as described, with the deceased, they could therefore furnish no evidence

whatever; their own statement to that effect of course going for little against the testimony of a disinterested person. In support of their statement that they had not been in the vicinity of the place in which the murder had been committed, however, Tuckett was recalled, and asked by the prisoner Simmonds whether he had not returned within the lines at an early hour in the afternoon of the day in question, accompanied by Chingowska, passing close by the spot where he, Tuckett, was standing on guard at the northern extremity of the camp, whereas the body of the deceased was discovered nearly two miles distant from the southern extremity! This circumstance, if proved, would have been strong presumptive evidence in their favour when the particulars of time and distance were taken into calculation; but the reply of Tuckett at once decided the case.

'Sorry I can't help my friends at a pinch,' said he; 'but no man passed my post entering the camp whilst I was on guard that day.'

The surprise of Simmonds was unbounded at this answer; and even Chingowska, who had long been schooled into the habitual control of every symptom of emotion on critical occasions, displayed some marks of astonishment. But the effect produced on the court was fatal to the cause of the prisoners. The apparent scrupulousness of Tuckett in declining to swear positively that the voices which he had heard raised in anger, and the utterance of threatening language, were actually those of the prisoners and the deceased, had disposed the judges to attach considerable weight to his testimony; and the directness and distinctness of his reply to the last question naturally bore down, in their estimation, all the protestations of the accused to the contrary. The circumstance of an article of the dress of each having been found within a short distance of the body of the murdered man, with whom it was believed they had just quarrelled, and against whom they had indulged in threats of vengeance, would of itself have weighed heavily against them; but when to this was added the damning fact of their having attempted to establish an *alibi*, which was disproved by the very witness whom they cited in its support, the court had little hesitation in coming to the conclusion that they were guilty of the crime laid to their charge, and sentencing them to undergo the punishment of death. The evidence was submitted to General Wayne in due course, who approved of and confirmed both the finding and the sentence.

Having made his brother acquainted with these details, Charley Simmonds stated that the most unaccountable and mysterious circumstance in the entire transaction he considered to be the answer of Tuckett to his question concerning his having passed him while on guard; as not only must he have seen him, but he had actually replied to a word of salutation which Simmonds addressed to him in passing—Chingowska passing him in silence, in consequence of the affair concerning the rifle. The allusion to the rifle immediately recalled the threat of Tuckett to the memory of Tom, the relation of which seemed to Charley to throw a new light on the whole procedure. The hope of life again sprung up within his bosom: a variety of suggestions were proposed and rejected; and Tom at length departed to carry into execution the only plan which held out a possibility of averting the threatened doom of the condemned, and bringing the real assassin to justice.

Proceeding to the quarters of the general, he sought and obtained an audience, laid before him the suspicions he had formed, and the hopes he entertained of being enabled to clear up the mystery, and concluded by begging a brief respite of the sentence, to admit of his making the exertions he proposed. This was at once and decisively refused. It was clear that the general was fully convinced of the guilt of the prisoners; and the utmost that the petitioner could prevail on him to grant, was permission for himself, and any of the troops he might select as his assistants, to pass into and out of the camp, as they might find it necessary, during the night—the ordinary rule being, that none should pass the lines between sunset and sunrise—with leave to approach his the general's

quarters, and have him aroused at any hour previous to that appointed for the execution, should he succeed in discovering anything tending to demonstrate the innocence of his unfortunate brother.

Tom's next step was to collect about a score of his brother's most intimate associates, acquaint them with the measures he meant to adopt, and request their co-operation. Of course the warm-hearted Borderers embarked with enthusiasm in the cause; and in a short time Tom proceeded to the scene of the murder, accompanied by a body of friends whose zeal, combined with the skill, ingenuity, and perseverance which the peculiar habits of the life of the backwoodsman naturally endow him with, promised to do all that could be effected by human agency towards securing the consummation of his hopes.

Their first care on arriving at the spot was to ascertain the precise position occupied by the body of the deceased when first discovered. For this purpose they induced the soldier who had made the discovery to accompany the party. Connecting the information obtained from him with the fact that the ball had entered the breast, and passed out between the shoulders, which had been previously ascertained by the examination of the body, they were enabled to form a pretty accurate idea of the quarter from which the deadly missile had first proceeded, and, by necessary consequence, of the direction in which it had most probably continued its course after having perforated the person of its victim. They then dispersed, and commenced a rigid scrutiny of the bark of the neighbouring trees in that direction.

The difficulties which obstructed the examination were of no trivial character. It had scarcely commenced, when the sun went down, and night descended. Still, the search must be prosecuted, or the object of their solicitude be abandoned to his fate, as he would assuredly expiate his imputed crime on the gallows at daybreak, if his innocence were not established in the interval. Accordingly, pine-wood torches were prepared, and each individual of the party bearing one, the work went forward. But hour after hour passed away, and still no discovery was made. Midnight approached, and the hopes of the associates became fewer and feeblér, and some amongst them began to calculate the period that Charley Simmonds had to live. Still, they toiled on through the livelong night, resolved that at all events no effort of theirs should be wanting to avert the horrible fate which seemed to await their old companion.

The gloom of the eastern sky was still unvisited by any symptom of the approaching day, though some of the young men had already begun to cast fearful glances at that quarter of the heavens, when a loud and cheerful shout from one of their number speedily brought his companions to the spot. He pointed to an orifice, the recent nature of which was evident from the rawness of the timber, in the soft trunk of a cotton-wood tree, by probing which with the smaller end of a ramrod, the presence of a foreign body at the depth of a few inches was ascertained. The application of the axe speedily extracted the object, on the nature of which was now suspended the realisation of all their hopes, and which proved to be as they expected—a leaden bullet, and that with which doubtless the murder had been committed. Its appearance at once demonstrated two things: the softness of the cotton-wood had so little altered its shape, that the ragged lead proved with the utmost distinctness that it had been discharged from a *grooved barrel*; consequently it could not have been fired by Chingowska, who still carried, in default of a better, the old *smooth bore* which Tuckett had palmed upon him as already recorded; whilst its size was so great, that it was at once declared that no rifle barrel on the frontier *save one* would have admitted it; therefore it could not have been fired by Charley Simmonds, as he was not the possessor of the weapon which formed the exception.

In anticipation of this discovery, and with a view to the possible importance of a moment of time, the party had brought with them from the camp a number of horses. Mounted on the fleetest of these, Tom Simmonds

now swept along with the speed of light towards the general's quarters, for life and death indeed depended on the cast. His tale was soon told, and an order for the suspension of the execution procured, the general not hesitating to grant it on viewing the new features which the case presented; and ten minutes afterwards, he placed the important document in the hands of the commander of the prisoners' guard, as that officer was in the act of delivering over his charge, to be dealt with by the provost-marshal according to their sentence!

At a later hour in the morning General Wayne directed the body of poor Benton to be exhumed for further examination. Every individual experienced in gunshot wounds who viewed it pronounced the wound which traversed the body to have been beyond all doubt inflicted by a rifle ball; and now that attention was directed to that point, declared with equal confidence that it was nearly double the size of the orifice which would have been caused by the largest bullet which a gun of the calibre of the ordinary western rifle, such as that carried by Charley Simmonds, would admit. With reference to the wound in the head, it was well known that Simmonds never carried a tomahawk, and it was shown to be physically impossible that it could have been inflicted by that of Chingowaka. The axes employed in western warfare, it is well known, are of two kinds—one, the blade of which is narrow, and the edge from point to point long; the other having the face of the weapon short, but its depth from the edge to the eye considerable. That worn by Chingowaka was of the former kind. A blow from it must have produced an incision nearly twice the length of that which the head of poor Benton exhibited, and could not possibly have made one much above half its depth. On applying one of the latter description, however, partaking of the form of the wedge rather than the hatchet, it was found to fit the wound with the greatest exactness, so as to leave no doubt that the blow had been inflicted by a similar weapon.

The general inquired whether Tuckett was accustomed to use the tomahawk; and on hearing from a score of persons who were familiar with his habits that he carried one of the latter description, ordered him at once to be placed under arrest.

But that worthy had not been disposed to await the result of the investigation. The camp was searched; but he was nowhere to be found. Some of the heavier and less portable articles of his property were still at his quarters; but it soon became plain that, having heard of the discovery of the rifle ball, which was certain to bring home the murder to his own door, as the possessor of the only piece on the frontier that would carry one of the size, he had at once absconded, taking with him little besides his arms, including the very rifle which was so essentially connected with the discovery of his part in the catastrophe.

Whilst the excitement was at the highest, a man arrived in camp who had been absent on leave since the morning of the day on which the murder was committed, and who heard of the tragedy now for the first time. On being informed of the circumstantial evidence which had so nearly resulted in the death of the late prisoners, he at once stated that, on the evening previous to his departure, he had seen Tuckett tear a morsel of the fur from the trimming of the hunting shirt of Charley Simmonds, the latter having thrown the garment aside whilst engaged in some athletic exercise. He thought it odd of Tuckett, he said, but did not interfere, as he considered it no affair of his. The wampum belt of the Indian had doubtless been purloined whilst the owner lay in a state of helpless intoxication, and both deposited for obvious purposes in the place where they were subsequently discovered.

Shortly after it was ascertained that Tuckett had absconded, Chingowaka was missing also. The day passed away, but no intelligence concerning him could be obtained. The night fell, but he was still absent. At an early hour on the following morning he entered the camp, with the much-prized rifle once more in his possession, and at his waist a human scalp, freshly torn from the

victim's head, depending from which, more than one individual asserted, was the long coal-black hair of Bill Tuckett, *alias* Sam Staples.

ANCIENT SEA-MARGINS.

CHANGES of the relative level of sea and land, in times which may be described as recent in comparison with the earlier geological eras, are amongst the admitted truths of science. They are evidenced by terraces and shell deposits at various heights throughout not only this, but many other countries. For some years past, the predominant doctrine on this subject has been, that the changes of level were produced not by a depression of the sea, but by an upward movement of the land, this movement being understood to be usually confined to limited portions of the earth's surface. Such movements, as is well known, have been observed to take place on the coast of Chili, and on the north side of the Baltic; in the latter case, the rise of the land is believed to be going on at the rate of about forty inches in a century. This is one strong reason for believing that the land has in all cases been the moving element. Another, which was pointed out by Mr Playfair, is, that for the decline of the sea from the land, even to the extent of only a few feet, we should need to suppose the removal of a corresponding depth of water all over the globe, whereas the rise of a piece of land, even supposing it to be one of many hundred square miles, is a phenomenon which traffics with comparatively a small quantity of matter. So has stood the subject for some years, no one, however, making any strenuous efforts to arrive at a general view of the memorials of change of level which exist around these and other coasts, to ascertain how far any of them extend with strict horizontality, or to compare their heights at various places. It has been tacitly taken for granted that such objects are local, and consequently that, beyond the general fact of their existence, they say nothing as to the past history of the earth.

In the work quoted below*—to which, for obvious reasons, we cannot advert critically—an account is given of a laborious series of personal investigations prosecuted in many parts of this island, and also in France and Ireland, from which the unexpected result has arisen that, besides the few specimens of ancient beaches hitherto observed within sixty feet above the present level of the sea, there are at least fifty more at different heights up to about 1300 feet, and furthermore, these are always horizontal, and the various fragments found in different districts observe particular levels; so that it would appear the relative level of sea and land in this island and the neighbouring lands has been shifted scores of times, *without the land having been moved off its original plane to any perceptible extent*. It will readily be observed that it is difficult to imagine such a result to have arisen throughout so wide a space, if the land had been moved every time that the sea was placed in a new relative level. The doctrine of the mobility of the land is therefore so far discounted by what is now brought before the public, and no small disturbance is consequently threatened to many of the conclusions arrived at by geologists. We have not, however, stated the whole case; for it also appears from this volume that there are ancient sea-margins in Norway and North America observing levels precisely correspondent with those of Britain and France; thus extending the uniformity of shift over a very considerable portion of the globe. The probability for a movement of the sea as against a movement of the

* Ancient Sea-Margins, as Memorials of Changes in the Relative Level of Sea and Land. By Robert Chambers, Esq., F.R.S.E. Edinburgh: W. and R. Chambers, London: W. S. Orr, 1848.

land, becomes, in regard to this portion of the earth, proportionally great, though it certainly would not be graceful to dogmatise on this point, while all the great masters of the science rest, however unsatisfactorily, on a different conclusion.

The lowest ancient beach of any note is one at about twenty feet above the present level of the sea. It generally appears in extensive plains of clay or sand—as, for example, the carse of Gowrie and Falkirk in Scotland, and the low plain between Portsmouth and Brighton, and that extending along the south shore of the Bristol Channel in Somersetshire. Another noted one is a little above forty feet; another about seventy feet; another at a medium of about 107, above which the land in many districts makes a more sudden and abrupt rise than at any other point. There is a great terrace at about 192 feet, which appears along the right side of the Avon valley at Bath, and other places in England, as well as all round the outskirts of Paris, and at other places on the Seine. At about 280 feet, there is a grand terrace seen at many places. Not less remarkable is one at about 393 feet; this appears at Abbotsford on Tweedside, at Colinton (near Edinburgh), in Dumfriesshire, and—at Versailles. One of the level ridges beside Lake Ontario, which are believed to have been produced by a body of water resting there, is of the same height. It is also the height of a shoulder of Arthur's Seat (a hill near Edinburgh), where the rock, hollowed out into a kind of trough, is found to be all smoothed, as by some mechanical agent applied laterally, while the surface bears numerous scratches in the same direction—the work, it is believed, of ice. A sea, at this height, bearing along icebergs, would be adequate to produce the effects; and it therefore becomes important to learn that the ocean did once stand at this level. Another great terrace, in France and America, as in Britain, is at 545 feet. The table-land round Rouen is smoothed down to this level; so is one of the plateaux of the Paris basin (at Buc). Such is the height of the ancient beach above the falls of Niagara, and of one of the lake-ridges of Ontario. At the same level, a terrace runs along both sides of the Tweed, and along its tributaries, portions of it affording sites to the towns of Selkirk and Peebles, and the ancient fastness of Newark. So also does the remarkable sandy plateau at Carstairs in Lanarkshire—about 684 feet above the sea—come into relation to a grand terrace connected with the Mawmee river on Lake Erie. Amongst the examples of ancient beaches of greater elevation, the celebrated *parallel roads* of Glenroy are by far the most remarkable. These have at length been ascertained by levelling as respectively 847, 1059½, and 1139½ feet above the sea, the latter being about the height of a terrace seen in several places in the centre of the island. The probability of these markings having been produced by the sea, and not, as has been supposed, by a lake, now becomes, for this and other reasons, very great.

All of these markings are such as to prove a shift of the level of the sea from a high point to that where it now rests, as the last great event in the history of the globe. They are connected with the most superficial formations—namely, those beds of sand, gravel, and clay usually grouped under the name of 'alluvium.' They denote a period of repose, like the present, but closely following on the disturbed period, of which the diluvium or drift* is the memorial. Some years ago, when the glacier theory was at its height, Dr Buckland, M. Agassiz, and Mr Lyell pointed out accumulations at the openings of many little glens in Scotland as indubitable examples of *moraines*, similar to those which are brought down by glaciers in the Alps at this day. These are here shown to be merely *deltas*—the detrital sheets brought down by the burns, and delivered into the estuaries once filling the glens. In the speculations on the lake origin of the Glenroy

terraces, much stress was laid on the fact, that there was a head of a valley coinciding in height with each terrace, as if the water had there found its ancient outlet. It is now shown that, in a cluster of islands closely placed together, such as the mountain tops of Glenroy would once be, there is a tendency in the narrow intermediate sounds to be silted up, so as to be passable in a low state of the tide. Were the sea to withdraw from such an archipelago, it would leave terraces round the islands, and the silted-up sounds would become heads of valleys of corresponding level. Thus the great argument for the lake origin of the Glenroy terraces is taken away. Another novelty brought forward in this work is a view of the way in which lakes have in many instances been formed. In the Great Glen of Scotland, for instance, which is a deep trough amongst the hills, there is a range of lochs, of great depth, separated by gravelly isthmuses. Whence the isthmuses by which the lakes are confined? No great currents could have brought these accumulations, passing over profundities, amounting in the case of Loch Ness to seven hundred feet. They are shown to be the remains of detrital matter brought down by side rivulets when the sea filled the glen. A careful examination shows that '*all the side glens containing mountain rills of rapid descent, and consequent great power of bringing down debris, occur at the isthmuses.*' Thus the Tarf and Chaldar come in at the place between Loch Oich and Loch Ness. Loch Ness, again, is separated from the sea by a detrital mass, the remains of what was brought down by certain powerful rills which descend from the hills behind Dochfour. The rivulets Urquhart and Garry enter Loch Ness, it is true, at the broad side; but there are special circumstances in their cases, which have rendered them incapable of projecting a detrital mass across such a profound glen, and so forming an isthmus.

It is startling to find in this work so many of the sites of mansions and other remarkable edifices, and even of large towns, set down as ancient beaches, though it is only a natural consequence of the attraction which flat ground presents for building. Thus the bulk of Glasgow is on a beach, which rises to about twenty-six feet above the sea; the western portion of Liverpool is on an ancient beach, between sixty and seventy feet above the present sea-level; the terrace on which a large portion of northern London is situated is an ancient beach; and so forth. There is something, however, much more startling in the details given respecting the hill on which the Old Town of Edinburgh is situated. And here we shall indulge in the only extract which it seems proper to make from the section of local investigations.

'The Old Town, as is well known, is [mainly composed of a street] built on a sloping ridge or *tail* of a mile long, stretching eastward from the Castle rock, and extending in vertical height from 108 feet above the sea at Holyrood Palace, to 325 at the Castle Hill. It may beforehand seem very unlikely that ground which has been the site of a city for the most part of a thousand years, and undergone all the changes incidental to frequent renewals of the buildings, should continue to exhibit with any distinctness traces of such peculiar natural markings as are the subject of this work. Nevertheless, having remarked a series of flats, or, as it were, landing-places, in the general ascent of the principal street which runs along the top of the sloping ridge, I deemed it not impossible that they might be primitive features of the same character with indications which I had observed on similar hill-faces as yet in a state of nature. It appeared in the very first place as favourable to the idea of their being natural features at all, that out of the four flats, two were the sites of ancient public buildings of an important character, such as the best or most convenient ground would be selected for, while a third formed a demarcation between the city and its ancient suburb the Canongate. The crucial test, however, evidently lay in the levels. If these cor-

* The stiff blue clay mixed with boulders, usually called in Scotland the *til*, resting immediately under the alluvial formations.

responded with those of ancient beaches well-marked elsewhere, and especially in the neighbourhood of the city, then was it tolerably certain that the flats in question were indentations made by the sea, in the course of its subsidence to the present level. If it should prove otherwise, they might be presumed as accidental, or the result of causes not concerned in the present inquiry.

Now the reader has already seen many examples of beaches of this range of elevation described. Let us, before taking any further notice of the Old Town indentations, advert to several markings in the immediate neighbourhood of the city.

Just beyond the suburb of Newington, an obscure rill called the Powburn pursues its way through a little valley, observing an easterly direction. On the upper brink of this valley, to the north, there is a terrace crowning a steep slope or bank, and presenting all the usual appearances of an ancient sea-margin. Part of it having lately been laid out as a public cemetery, we have had opportunities of ascertaining that the ground to a considerable depth is composed of a clayey sand. This terrace appears to be 170 or 171 feet above the sea.

Passing westwards less than a mile, we find, behind Grange House, a terrace, more faint, yet sufficiently distinct, which can be traced along till it crosses the Canaan road into the grounds connected with the villas of that district, and so onward to Falcon Hall; on the other side of the valley of the Jordan Burn, opposite to these villas, the corresponding terrace is prominently marked; the two sides of an ancient creek of the sea, when that element stood rather more than 280 feet above its present level. The same flat is rudely marked on the skirt of the Blackford Hill, at Libberton West Mains. These markings, however, are all of them tame compared with a grand terrace of the same height on the north side of the little valley beyond the Libberton ridge. The fine old mansion of Moredun is situated upon it: it extends, with great distinctness, a good way eastward, affording site to Mr Lothian's villa at Ferney-side, but fades away on the slope under Edmondstone House.

When the sea beat on this terrace, the hill on the summit of which Craigmillar Castle is situated presented only a little rocky isle above the waves. This isle consisted of a mass of sandstone, which forms a vertical precipice to the south, just under the walls of the castle. A good way out from the bottom of this cliff, in all three directions, is a flat on which the castle garden, with its ancient quaint devices, may still be traced. That flat is 280 feet above the level of the sea. Answering in elevation, it has been too much disturbed by the hand of man to present the required linearity. I am assured, however, by Mr Smith of Jordanhill, that the overhanging cliff bears much of that appearance of sea-wearing which he has observed in similar precipices that either are now, or have been at a comparatively recent period, exposed to the dash of the billows. Whether it does so or not, there can be no doubt that it once was exposed to this action, as the sea could not have laid down the Moredun terrace opposite without at the same time rolling its waves along the Craigmillar garden, in which case it must have impinged on the cliff at every high tide. How little could Mary, when she walked in this garden, pondering on her conjugal infelicity, imagine that we should in time learn of natural transactions which took place upon the same spot ages before her period!

If, in the winter season, when the ground is comparatively clear for observation, we take a station at Dalkeith, and direct our eyes to the southward slope which there rises above the Esk valley, and along which the Kelso road proceeds, we shall very readily perceive that it is, as it were, laid out in flats, the straight horizontal outlines of which give a strong character to the ground. Some extend westwards, and fade on the hill-side; others stretch far in the other direction, till they terminate in the sky line. To the east of Dalkeith, this terraced hill-face is distinctly seen rising out of a

broad plain, which seems to form no inconsiderable part of the park around Dalkeith Palace, and of which there is also a large section to the south of the park wall, the duke's kennel being situated upon it. This is from about 144 to a few feet more above the level of the sea. It is an unmistakable ancient sea-margin in its form; as to its constitution, the cutting for a coal mine near the kennel gives forty feet of sand slightly mixed with clay. The street of Dalkeith itself, and the flat ground to the south near Woodburn, form another level, about 168-73 feet; the South Esk intersecting the space. On the hill-face above-mentioned, at Cowden and Whitehill, the terraces are respectively 280 and about 390 feet in elevation.

Let us now return to the street-covered ridge of ancient Edinburgh. We start at the plain of Holyrood, 108 feet above the sea. From hence the street ascends, with no well-defined interruption, till we reach Milton House, where there is a flat of at least 100 yards in extent. This is 144 feet above the sea-level, agreeing with the plain at the duke's kennel, and with several markings in the north of Scotland. As being flat ground, it has been selected for the sites of some of the best mansions in the old city, particularly the elegant house and grounds of Lord Justice-Clerk Milton, and the hotel of the Lords Panmure, in which a greater than earls, the illustrious Adam Smith, dwelt for several years and died. After another ascent, there occurs another flat, even more extensive. From probably the same principle of preference, this gives site to the church and old court-house of the Canongate; likewise to the supposed ancient mansion of the Gordon family, and to the palace of the Earls of Murray—the residence of Cromwell when in Edinburgh. It is 165-7 feet above the sea, corresponding with numberless terraces already and to be described. In the preceding instances, the flat has been superficially as extensive as the ascent. The street has been fairly divided between the rise and the level. We now, however, pass along a somewhat longer ascent, and then come to a short, though very decided flat at the head of the Canongate, from 202 to 205 feet above the sea-level. [Terraces at this elevation occur in many parts of the country.] Another comparatively long ascent, and at St Giles's Church, we come to a fourth flat—one unusually broad and well-marked. Here the principal public buildings of the ancient city were congregated: the parish church (afterwards cathedral), the Tolbooth or town-house (both of them structures of great antiquity), and the Parliament House and courts of law. Here the ground has been slightly lowered in modern times, to the effect of softening the abruptness of the original transition from the ascent to the flat. The original height at the flat was about 280 feet above the sea-level—a perfect coincidence with the terraces at Canaan, Moredun, and Cowden; as also with examples in other districts. It may be added parenthetically, that the tract of table-ground on which Heriot's Hospital and the Charity Workhouse stand is precisely of the same height. Thus is completed the series of indentations in the Edinburgh ridge, all of them, it will be observed, coincident in elevation with distinct memorials of sea-margins in the surrounding country, near, as well as far. It seems reasonable, accordingly, to infer that these marks were made by the tooth of the sea, at the pauses which it made in descending from between 300 and 100 feet over its present level. When we reflect on the many historical associations connected with the last group of buildings, it becomes a curious consideration that the locality of them all, from the commencement of the Civil War with the Liturgy riots, down to the seizing of Porteous in his prison, as well as the localisation of the supreme law-courts of the country, should have been, to all appearance, determined by a circumstance so different in its relations as the wearing of the sea on the face of a drift-formed hill, in an age so remote in comparison with the eldest of historical events!

We shall return to this work for some details tending to show that the last shifts of the level of the sea took place after the country had received its human inhabitants.

GATHERING BLUE-BELLS.

It sometimes happens that, without any particular cause for anxiety or depression, the mind is unaccountably perplexed and weighed down; and at such seasons even a dream of the night may produce a painful effect, while our sad memories or futile regrets cannot altogether be dispelled even by the strongest exertion of our reasoning powers. I had arisen one morning to fulfil the daily round of appointed duties, but in a spiritless, discontented, and repining mood. Feelings of the kind usually hold their sway in the silent and secret recesses of the heart; for we know that it is weak and wrong to indulge in them, and we are ashamed to seek for sympathy, which indeed can be but sparingly accorded in such cases. Towards the afternoon I sallied forth to try the effect of a solitary ramble, knowing this to prove frequently the best restorative for a nervous or morbid temperament. In a secluded spot, from whence a gentle pastoral valley was visible, between the spreading branches of old linden-trees, overshadowing the pathway, which led onward amid a collection of mossy hillocks, on whose broken surface scanty heather tufts and delicate blue-bells were scattered, an object attracted my attention. It moved slowly, and with apparent difficulty, now disappearing behind the hillocks, then emerging and stooping down, and altogether presenting a very peculiar appearance. I saw presently that it was a human figure, which I supposed at first to be some poor misshapen child seeking for blue-bells. But although correct as to the employment, I found, on nearer approach, that the gatherer was no child, but an unsightly and deformed cripple of mature years.

She supported herself on crutches, and besides the hideousness of the most unnatural distortion it is possible to imagine, added to dwarf-like stature, her wan but placid face was rendered yet more ghastly by heavy linen bandages bound around it, and across her forehead. Her well-patched coarse garments were scrupulously clean, while her long thin white fingers were eagerly stretched forth to pluck the blue-bells, which she added to her store with childish delight.

I volunteered my assistance, and soon not one more blue-bell was to be found. She thanked me in a sweet low voice, and quietly set herself down on a bank of moss, and began to arrange her humble nosegay: at first I had fancied that she was imbecile, but that thought was quickly dispelled on hearing her speak, and meeting the earnest intelligent gaze of her deeply-sunken but bright black eyes.

On sitting down to rest beside her, and inquiring if she was fond of flowers, as she took such pains to collect them, 'Oh yes, ma'am!' she answered, 'I love them dearly; they do me so much good with their happy looks and sweet scents. I take them home with me, for they ease my pain when I have them near me to speak to. I am but a silly one; though I often remember Him who made both me and the flowers.'

I asked where she suffered the most pain. 'In my head, ma'am. It has been so ever since I can remember—sometimes better, sometimes worse; but I will sing you a song if you please, for helping me to gather this pretty nosegay.'

It was useless my requesting her to desist from the exertion; she began without heeding my remonstrance, and as if it were the return she habitually made for kindness, warbling the words of a bygone and very beautiful ballad. An attempt at sentimental description, when speaking of this poor creature, would be

ludicrous and unfeeling; yet her voice was so low and touching, and so full of gentle pathos, that as I listened to the plaintive strain and the old sad words, many painful but treasured memories were called up, and I could not restrain my tears.

Unfortunately I had no money about me, nor could I succeed in prevailing on the songstress to call at my home, which I found she must pass on returning to her temporary lodging. 'She disliked entering any house, unless obliged;' but she promised to be there again to-morrow, where the blue-bells grew, and when the lengthening shadows of the pale autumnal afternoon would mark the time for her.

Her story, as she told it to me, was a short and simple one, and yet not commonplace; nor could I doubt its truth for a moment, for 'the eye never deceives.'

She had been an orphan since the age of sixteen. Her father, who was a woodman, had been killed by an accident before her birth, when engaged in felling trees in the New Forest. The widow supported herself and her child by singing about the country, and working in the fields when she could get work to do; for as the daughter of a wandering Welsh harpist, the gift of song and the love of roving were in her hereditary. The unhappy circumstances, however, attending the birth of her infant had fallen heavily on the little innocent, occasioning, it was supposed, some organic derangement of the complex vessels of the head, and owing to the ignorant treatment of quacks, to whom her mother resorted, and a fall received in early infancy, making her, in her own sad words, 'What you see, ma'am.'

When her mother died, a benevolent physician, to whom her case became known, had given her a recommendation to a London hospital, defraying her expenses thither; naturally concluding that clever and multiplied advice, together with care and judicious management, might do much towards effecting a cure, or at any rate ameliorating her condition. 'But after a long time,' she added, 'all the doctors agreed that my case was an incurable one, and that fresh air and perfect freedom were the only things they could recommend as likely to ease my pain.'

She told me the name of the worthy practitioner who had originally befriended her, and who had continued to allow her a small sum weekly, sufficient for her maintenance, until two years previous to this period, when death had deprived the orphan cripple of her benefactor.

Since then, walking all over England and Wales, she had supported herself by singing, when able to do so, and by the gifts of the charitable. The open air was as necessary and nutritious to her as daily food, while her childish delight in gathering wild flowers formed the sole recreation and solace of her lonely existence—lonely as that of the lepers of old.

The outcast added in a gentle deprecatory tone, but far removed from the whine of the common mendicant, and putting her hand involuntarily on her bandaged brow, 'God is very good to me, for I have never wanted; and though He sees fit to send me pain, yet with the pain there is healing, for I often forget it all when I look on the beautiful things of His making. Indeed I am very happy; for if such fair flowers are to be found on earth, where the birds sing, and the waters are so clear, and the trees are so grand, how much more beautiful our home in heaven will be!'

'But are we so sure of seeing heaven?' I hesitatingly said, wishing to hear the answer. Her answer was a silent smile, but a serious and solemn one, only faintly lighting up her pallid suffering countenance; and when I parted with her, it was in the earnest and full conviction that this destitute cripple was indeed, as she affirmed, very happy; and passing rich also in the possession of the priceless graces of patient cheerfulness, resignation, and faith.

This little adventure had given me a lesson, and administered a reproof, which all discontented and repining individuals may not have the good fortune to

encounter so opportunely. For my own part, the light of that poor cripple's smile is to this day upon my heart; and in the midst of the sorrows and anxieties of life, whether real or imaginary, my harassed thoughts often flit away to employ themselves happily and beneficially in—gathering blue-bells.

OCCASIONAL NOTE.

SUMMER TOURS.

It seems to be generally concluded that comparatively few persons will visit the continent this summer. The pleasure and health-seeking host will be mainly restricted to the more interesting districts of our own island, which were their sole resort during the war. For those who may be inclined to go northward, we may mention that there are now two lines of railway passing into Scotland—one by the east side of the island, only broken at the crossings of the Tyne and Tweed; another, which is quite uninterrupted, proceeding from Carlisle to both Edinburgh and Glasgow. There is a farther line to Stirling, which, by the time the present sheet sees the light, will be advanced to Perth; so that a tourist will be able to pass, without interruption, and in less than a day, from London to the border of the Highlands. In another year, we believe, this line will be extended to Aberdeen. Meanwhile, the scenery which, by its physical beauty and its romantic associations, presents the most solacing contrast to ordinary industrial life, can be reached from the cities of the busy south without the loss of a night's rest. Tourists from that region would do well to come to the north by one line, and leave it by the other, taking Glasgow and Edinburgh in their way. Edinburgh is in its highest beauty in summer, being almost as much a garden as a city, not to speak of its ancient towers in the air, and its streets of palaces. Hence a tour can be extended into the Highlands, to a near or far point, ending at Glasgow. The shortest curve is by Stirling, the Tro-sachs, and Loch Lomond, which requires only two days. A wider curve is by Perth, Dunkeld, Loch Tay, Loch Earn, and then the Trosachs and Loch Lomond, as before: this takes about four days. A still wider sweep passes on from Dunkeld to Inverness, and returns by the Caledonian Canal and the Western Islands to the Clyde. In returning from Glasgow by the Caledonian Railway, the celebrated Falls of Clyde can be seen by a stoppage of half a day at the Lanark station. Throughout all these routes there are excellent hotels. The chances of weather are tolerably equal through the summer and autumn, excepting perhaps in the latter part of July and early part of August, which are unusually apt to be rainy.

We eagerly embrace this opportunity of recommending English and Scotch alike to give due consideration to Ireland as a field for their summer ramblings. This may seem a strange advice to those who are shrinking from the tumults of the continent. But, whatever be the real state of the latter case, we are very sure that no true cause exists for dreading a visit to even the most ill-reputed districts of the sister island. There is no real danger of any kind to a well-meaning stranger in Ireland, and never has been. The discontents of the country regard wholly different objects. Persons who have not hitherto visited Ireland would, on experience, be surprised at ever having entertained fears on the subject; and they would equally be surprised to think that they had been so long in visiting a country possessing so many interesting features. The first and strongest point of interest is, we think, of a historical character. We peruse, in much of the social life which we see around us, a sort of living portraiture of past centuries in England and Scotland. It forcibly recalled to ourselves the Scotland of the days of the Covenanters.

It thus becomes a most instructive study, perhaps to none so much as to young persons. Then there is a foreign air mixed with much that we see in Ireland; there is also the strong cast of a different nationality, something distinctly more primitive than the Saxonism of our land, and leading to habits, and even modes of thinking, wholly peculiar. Add to all this the beauty of much of the country, the touching remains of antiquity everywhere thickly scattered, the rough oddity of the conveyances, and the quaint whimsicality of their conductors—and supposing you only will not be too keenly sensitive to the assaults of beggars, or too nice and fastidious in general respects, you cannot fail to derive fully as much pleasure from a visit to Ireland as you have ever done from any pleasure trip accomplished within the bounds of (to say the very least) the United Kingdom.

COLONY OF SOUTH AUSTRALIA.

THE agitation in favour of this colony increases every day. Besides books written for the express purpose of attracting emigrants, extracts from the local papers are industriously circulated, and it is sought on all hands to impress upon the public mind of England that South Australia is a perfect paradise both of capitalists and labourers. For our part, we mean neither to join nor resist the clamour. All we desire is, that the people should not, on the one hand, allow themselves to be carried away by representations that, however true at the moment, may turn out to have no permanent truth, or, on the other hand, remain obstinately blind to their own interest, through misgivings that are inapplicable to the altered circumstances of the time. In short, we do not want to dissuade our countrymen from leaping, but we would have them look beforehand; we would have them measure the space with their eye, and inquire calmly into the causes of the failure or success of preceding adventurers.

When the colony in question was first planted, the prosperity of New South Wales and Tasmania was at its height. The sheep of Spain and Saxony were naturalised on the shores of the Pacific, and a great commerce established in wool. In New South Wales, the settlers had spread themselves over the country in quest of pasture; and in Tasmania, where the surface was more limited, they had recourse to re-emigration to the mainland, and the rich plains of Port Philip were soon dotted with their flocks and herds. At the opposite angle of the new continent, the north-west, Swan River colony had been planted: but this did not turn out so well. The great object had been to get out capital, and men to work it, in what was supposed to be a boundless field; and with this view, free grants of land were lavishly given, at the rate of forty acres for every three pounds expended in goods and implements, or in conveying labourers. When the emigrants arrived, however, which they did in great numbers—most of them tempted by the idea of getting *estates* for nothing—they found that the only land as yet explored was on the banks of the river, where there was not room for half of them; and the timid or the impatient, therefore, set forth to seek a new home in the other Australian settlements.

But the calamity of Swan River was at once a gain and a warning to New South Wales, Tasmania, and Port Philip: a gain, because they thus obtained an increase both of hands and capital, and a warning, because it demonstrated that the system of colonising by means of indiscriminate grants of land was radically bad. And this question now became a very important one to the prosperous sheep-farmers of these settlements, for business was increasing, and *wages high*. 'It does not appear,' remarks a shrewd observer, 'that the labourers themselves had any objection to this state of affairs;*' but the farmers had of course the command of the press,

* Earl's Enterprises in Tropical Australia. 1846.

and the complaints that their large profits were diminished by high wages, soon rang throughout the parent country. If we could only have servants, thought they, as cheap as at home, we should get on famously; and some of them, in order to neutralise the 'injustice' complained of, actually hired labour for a term of years before the men left England. But when the men reached Australia, their views changed. Why should we, said they, be the sole step-children of fortune? Have we come to the antipodes merely to escape from hunger at home? Have we not the same right as our employers to a profitable return upon our capital, the only capital we possess—industry? And the end of it was, that the masters found they could not, even under a bargain, hold serfs in Australia more than in England, and that if they would obtain anything better than mock service from their men, they must remunerate them at something approaching to the common standard of wages in the colony.

The masters continued to make money, and to grumble—to grumble because they did not make more money; and the thoughts of the ingenious were given to the task of inventing a system of colonisation which should prevent capital from hurting itself as formerly, and bring out any quantity of willing labour at a low figure. In the midst of this excitement, the South Australian scheme was brought forward, and received with acclamations which our government could not withstand. The great territory lying between Port Philip and Swan River was put up for sale in lots, at a fixed minimum rate, the whole proceeds to be expended in conveying labourers from Great Britain; and for three years from 1837, a continued flow of emigration took place, the allotments rising in value, and the new colonists doing a thriving business in the purchase and sale of the lands they had come out to cultivate. But this of course could not go on. The neighbouring colonies continued to supply them with food as long as their money lasted, but no longer; the speculation was seen in England not to answer; the price of land fell; immigration stopped; and the reckoning came. The labourers who had been brought out with the sanction of government were only kept from actual starvation by being employed by the local authorities in public works, not otherwise pressing, in the capital of the settlement, Adelaide; the land-jobbers were compelled to turn themselves into farmers; and the lucky few who had invested their capital in sheep and cattle were the only thriving men in the community.

After this terrible reaction, South Australia appeared to get gradually into the precise position into which Swan River had subsided. In addition to exporting wool, and even a little wheat, they expended their surplus grain in fattening their surplus sheep, so as to be able to trade in their tallow; and although neither great consumers nor great producers, they contrived to live sufficiently well, and owing to the very insignificance of their business, to escape in a great measure the commercial crisis which soon after desolated the more flourishing settlements of Australia. But just when matters were resolving into this condition, a discovery was accidentally made, which gave a new impulse to the fortunes of the settlement. The soil was found to be rich in *metallic ores*.

This is the report of a gentleman who came from Swan River on purpose to inquire into the truth of the good news which soon spread throughout Australia. 'The whole colony is a mass of mineral wealth—copper, lead, zinc, and silver are known, and there is little doubt that quicksilver, gold, and precious stones abound. Quicksilver has been found in small quantities; the opal and garnet are found; and there is every reason to infer the presence of gold. Copper and lead are the only mines worked at present. I have examined the two chief mines worked. The Kapunda, belonging to Messrs Bagot and Dutton, has shipped this season 1200 tons of ore, producing in England £25 per ton, and landed in England at a cost not exceeding £19 per

ton. The Burra Burra mine is the wonder of the world; it exceeds the celebrated Pargo mines in the ratio of a million to one. The ore is seventy-five per cent of metal, a pure oxide, requiring no flux to smelt it; a common blacksmith's forge producing sufficient heat to run the metal. The lode is seventeen feet wide, of vast extent, and is quarried out like stone, in immense masses. Ten weeks' working have sufficed to produce £1700 value of ore. It is impossible to exaggerate when speaking of the minerals of this country. Iron was afterwards found to be as plenty as copper. In one district it was collected on the surface, and so pure, that the fracture of the ore resembled that of cast-iron. Copper was likewise frequently found cropping out of the ground in large rock-like masses; silver was obtained in considerable quantities; and the existence of tin was something more than suspected. And now came another very different-looking substance, stumbled upon accidentally by some men who were working a copper vein. The following is the account of it given in the Adelaide papers:—'Surrounded and imbedded in dark chocolate-coloured earth or gosses, were thickish layers of a bright-yellow metal, pliable to the touch, and evidently unconnected with the neighbouring copper. The vein was about two inches wide, giving metal in the proportion of perhaps a quarter of an ounce to an inch, and showing a tendency to enlarge in size. We had the gratification to examine these specimens, and we have since seen a much larger number from the same spot. They have been examined by Captain Frome, Captain Sturt, Mr Burr, deputy surveyor-general, Dr Davy, and others, whose scientific and practical knowledge of mineralogy leave the fact without a shadow of a doubt, that a most valuable mine of gold has been discovered.'

These discoveries have had, as might be expected, a great effect upon the value of the land. In 1843, only 600 acres were sold by government, at about £1.1 per acre; while since then there have been lots of 20,000 acres taken up at a time, the land realising in some places from £40 to £50 per acre, and in one instance £88, 15s. per acre. Nothing, in short, is wanted, according to the reports received from the colony, but *hands to gather in its riches*; and for want of this agency, crops of wheat are rotting on the ground, the carcasses of innumerable sheep going to waste, and gems and metals lying useless in the mine. What is wanted is simply hands, for heads may be dispensed with. Education is of no moment. Handicraft knowledge is comparatively a little thing; and even good character and habitual industry are little more than dust in the balance. 'Send us your *paupers*,' cry the eager settlers, mad with the sacred thirst of gold: 'grant to our longings the refuse of your workhouses—we will ourselves pay the expense of their passage, and when once here, no fear but we shall get work out of the laziest of them all!' Then there comes a tempting list of wages, from 6s. to 12s. per day, according to occupation; and from £25 to £70 per annum for farm and house servants. 'I advise all,' says a new agitator,* 'who are willing to work, and wish to improve their condition, to endeavour to obtain a passage out, either with their own cash, or through the emigration fund.'

Now, as the demand of the colony for labourers has been supplied to the extent of some thousands during the last two years, and as at this moment one-third of the large produce of the land sales is devoted to the transport of emigrants, we think it can scarcely be considered unreasonable if we inquire a little closely into the meaning of these outcries. We cannot forget that the very same outcries, from other quarters, gave birth, as we have related, to the colony itself; and we should like to be clearly satisfied that the object is not the same in both. A labourer carries his industry to a new settlement, just as a capitalist does his money, with

* South Australia; its Advantages and its Resources. By George Blackiston Wilkinson. London: Murray. 1848.

the view of obtaining a greater return for it than he could at home; and if the South Australian speculations are as beneficial as they are reported to be, they can well afford to continue the *present* rate of wages. Is this their intention? Or do they complain, not of the scarcity, but of the dearth of labour? And by offering to take our paupers off our hands, do they propose glutting the labour market, so as to bring down prices?

The book we have quoted last is a rambling and confused account of the settlement, from which may be collected, together with some information, a few facts that justify these questions. The Colonial Secretary in South Australia, for instance, remarks in 1846, that the high rate of wages now paid sufficiently indicates the insufficient supply in the labour market; and as a corollary, it is said by another authority that mining operations are kept in check by the extreme demands of miners and others employed. In such a state of things, how are we to account for the prejudice Mr Wilkinson mentions as prevailing against the colony, not in England, but on the spot itself? 'The South Australian newspapers,' says he, 'complain, and with great justice, of the many frauds committed by persons proceeding free to the colony in the emigrant vessels. They state that certain emigrants, who obtain a free passage at the expense of the emigration fund, rendezvous at the port without any intention of settling in the colony, making use of the bounty simply as a means of transport to their friends in the neighbouring settlements. The impropriety and injustice of the fund being used for such a purpose are obvious; for the money thus alienated and wasted has been paid by the South Australians on purpose to bring labour to their shores, where it is so much needed. It is indeed difficult to put a stop to the practice alluded to, unless an agreement be entered into with the intending emigrants, making it obligatory upon them to pay back to the fund the price of their passage, in case they leave the colony before a certain time has elapsed. Such a bond would, I believe, at once arrest this scandalous mode of peculation.' It is surely a little strange that labourers actually arriving at this new Dorado, after a six months' voyage, instead of being tempted by abundance and liberal wages, should ship themselves off immediately for places where there are neither gems nor metals to be had for the gathering!

We must not be understood, however, as being desirous of repressing emigration to this quarter. On the contrary, we would have it go on in a steady stream till wages and profits adjust themselves by degrees; although we can see no legitimate reason for flooding the new country all at once. The passion for mining speculations has already acted injuriously upon agriculture, and raised the prices of necessaries; and this would hardly be amended, at least in the first instance, by the enormous increase demanded in the number of mouths. South Australia is at this moment, in one respect, in the condition of an old country: it has not merely a means of feeding itself from its own productive resources, but a means of purchasing from other countries the comforts and luxuries of civilisation. Without this latter advantage no colony is worth a straw. Men do not cross the ocean to sink into savagism, but to enjoy in more abundance and security all that makes life desirable in an advanced state of society. But we wish the resemblance to an old country to stop here. We wish the profits of labour to bear a fair proportion to the profits of capital; and we wish the tide of emigration, therefore, to continue setting steadily towards the colony, but not deluging it with a dependent population, such as we have at home.

In this little colony L.1000 was raised in two days for the distressed Irish, a fact which speaks eloquently both of the pecuniary ease and generosity of the population. It is desired, however, by those who fancy they are not making money rapidly enough, to dilute and vitiate this population by an inundation from the Eng-

lish workhouses; and the 'Morning Chronicle,' catching up the cry from the mining speculators, proposes to draft at once into Australia 200,000 paupers! If South Australia, in compliment to her mining prospects, were to get even one-fourth of this number, it would *treble* her population, and bring down the rate of wages instantaneously and permanently to the starving point. And this outcry, it may be useful to observe, is raised in the very face of the experiment made in Canada, which is almost utterly ruined by pauper immigration.

In old countries, the mining business is the most fluctuating and uncertain in the whole range of commerce; but there seems every reason to hope that in South Australia it will be a source of considerable wealth, probably for many years to come. It must be remembered, however, that the colony is at the distance of half the world from Europe; that as yet it is destitute of coal; and that until the population be reduced to pauperism and servage, it cannot possibly obtain cheap labour. Even if the principles of political economy, however, were there reversed—as is the case, in these singular regions, with some natural phenomena—we should still refuse to sacrifice the real wellbeing of the new community for the mere acquisition of money.

There is a good deal of practical information throughout Mr Wilkinson's volume; and it can hardly fail to be useful to the intending emigrant who will read it with the caution we recommend. We have of late had a good deal in these columns about 'life in the bush,' or we should be happy to extract an account of the way in which the solitary cattle-owner passes his time. From this account, however—even if from this alone—it appears obvious enough that the grand thing needful for an emigrant in any station is a wife. 'The married man,' says our author, 'has many and great advantages over the single, and his home (however homely it may be) will contrast favourably with the bachelor's: not only is his happiness enhanced, and his labour cheered, but besides this, an active woman does many things for her husband which he can find neither time nor inclination to do for himself. I should say, therefore, to all settlers or intending emigrants, "*Get married before going out*, as the cheaper and better course; but before you marry, tell your intended the mode of life she may expect, that there be no surprise manifested when it is too late to change." Viewed only in a mercenary and politic light, the wife is a great saving to her husband: if he is poor, she cooks for him, makes and mends his clothes, keeps his house in order, looks after the poultry, and does a host of little things that he must unwillingly resign if deprived of her assistance. Thus she is a profit and a great help. But when he returns fatigued with his daily labour (and people do not *play* out there)—when, weary and languid, he comes in sight of his hut—his heart warms at the comforts he knows he will meet; and the light shining out through the crevices in the door, walls, and roof, cheers his very soul, and he feels happy that she—the preparer and crown of all this additional happiness—is anxiously waiting to receive him. When he opens his door (no bolts or bars are wanted where there are no thieves or bushrangers), his clean hut and smoking supper (not mere potatoes and salt) make him think that, if he should be so unfortunate as to lose his present helpmate, he must either break his heart at once, or get married again directly.

'Equal inducements exist for the rich man to marry as for the poor. Though wealthy as Croesus, what would he be in the bush without a wife to cheer him in his misfortunes and troubles, and double his joys by sharing them? In either case, a bachelor in those wilds is an object of pity. No place under the sun is better than Australia for observing the genuine bachelor; there he sits in his lonely hut, with his little "notions," as the Yankees call them, ranged about; and if you pop upon him unexpectedly, you find him, unless he keeps a servant, washing, mending, and ironing his own linen, making and baking his bread, from

which he hospitably turns to broil a chop for you with all the gravity of an old cook; everything about him looking as if it wanted a few children and a wife to rummage him about, and rub and round him into a sociable and "happy man."

Column for Young People.

ENEMIES AT HOME; OR BLOODLESS VICTORIES.

'The New Zealanders,' said I one day in conversation with my little son, 'imagine that by killing their enemy they transfuse into themselves the qualities of the individual; that in devouring the body they also devour the spirit, and become possessed of his prudence, his cunning, his energetic hatred. This mortal enemy, become their internal captive, is constrained to fight for them within them, to conquer in their behalf; and each time that they return triumphantly from the war, they sing an ironical hymn of praise to this invisible slave, to thank him for the victory in which he has so valiantly fought for them. One would suppose it almost impossible to find anywhere so complete and terrible a personification of victory—the vanquished absorbed in the victor! And yet, my child, I can tell you of a yet greater triumph. I know of a conqueror yet more victorious than this savage. In other countries there are other races which have also their enemies—enemies who pursue man everywhere, and for ever, in winter and in summer, by night as well as by day. What course must he pursue? shall he fly from them? No; he waits their approach: he does more, he attacks them. He is but a dwarf, however, and his adversaries are giants. It matters not: the conflict will be fearful; his blood must flow. Yet he shrinks not from the conflict: he is determined to bring them under subjection to himself; and they are brought under subjection. The savage kills his adversary, to bury him in a living tomb; but this man brings his adversaries alive within his home; he leaves them in their full vigour, because he would have them not only *subject* to him, but *serving* him. Yes, my child, they are there beneath his roof, struggling, but yet enchained, but ever ready to break their bonds, and sometimes bursting forth into rebellion with destructive fury; yet he lives on amongst them, calm and serene, apparently unconscious of his danger from these powerful slaves, commanding one to nourish, another to warm him, and a third'—

'Papa,' interrupted my child, who could no longer contain his curiosity, 'in what country is this wonderful dwelling to be found, and who is this powerful being? Do tell me something about them?'

'The dwelling, my child, is this very room; and the supernatural being is yourself.'

'I, father!' exclaimed the child with mingled surprise and terror.

'Yes, you; for you, too, belong to the race of man.'

'And does death threaten me on all sides? Do I live in the midst of enemies?'

'Yes, assuredly you do.'

'And who and where are they?'

'Would you like to see one of them appear forthwith?'

'Yes.'

'Well, then, you shall yourself summon it to your presence: but first listen to me. Do you remember our excursion on foot last year into the country, and the frightful storm which we encountered?'

'Yes, papa.'

'What a hurricane it was! and such torrents of rain! It seemed almost like a waterspout. In one moment cloaks, coats, shoes, and stockings, all were penetrated, drenched by the water. Our whole bodies streamed with water, water froze the blood within our veins, water saturated the ground beneath our feet, and carried away the soil from our path, until it destroyed the very traces of our road, and we knew not which way to turn. Now, then, come with me, my child, follow me to this end of the room here, where the bath stands. Now turn this cock.'

He turned it—the water spouted out. 'See here,' I exclaimed, 'this formidable enemy, or rather behold it conquered. Sheltered beneath his walls, man braved the inundation; but he desired to do more. Water no longer fell on his defenceless head; but this is not enough—he would have it fall for his benefit. By placing at the edge of the roof which shelters him little channels to receive the rain, he spreads as it were a trap for his enemy, he takes him captive, and conducts him through pipes and conduits

into reservoirs which he has constructed to receive him. Soon a further progress is effected. We became weary of waiting for water to come down to us from heaven, or of going to seek it from the flowing river or the distant spring: we must have it at hand, even in our chambers, above as well as below: it must ascend to us: we will no longer descend to it. Suddenly the mouth of one man pronounces that word so fruitful of results, "Water always finds its level." This word was the signal for fresh conquests. Armed with the discovery, man raised rivers from their beds; he brought within his reach, from the most distant hills, springs which had heretofore been suffered to run to waste on the surface of the earth; and subjugating them by means of their own laws, carried them into great reservoirs, above the level of large towns, over which they hung like suspended lakes, and from thence scattered them at will, and guided them forth to lend beauty and healthfulness to his abode; for in towns, water brings with it health and purity; it removes diseases from the infected air, it lays the suffocating dust, cools the heated atmosphere, cleanses our soiled raiment, extinguishes the devouring flame, nourishes the trees, the flowers, gives freshness and beauty to the spring.'

'But where is the level, papa, of the water in this room?'

'In a reservoir.'

'And how is the reservoir itself filled?'

'Some reservoirs receive streams still loftier than themselves; and into some the water is pumped by powerful steam-engines from the river below. In the Champ de Mars at Paris, there is one more wonderful still. Here there is no colossal machine, no gigantic piston or creaking pump, no glowing fires or noisy apparatus of wheels and levers—nothing of all this: only a little hole in the earth, a narrow orifice, whence a slight column of tepid water issues tranquilly, in the proportion of one thousand litres in a minute, and rises to a height of one hundred and ten feet.'

'One hundred and ten feet! entirely of itself, papa?'

'Yes; because "water seeks to regain its level." And whence comes this stream? From the hills of Champagne. Science seized it at its source, followed it through all its windings, even in the depths of the earth, and striking the ground at a distance of forty leagues from the spot whence it takes its rise, it said, "The stream is here!" and the stream gushed forth. Thus rivers and streams, interior lakes, impetuous torrents, devastating cataracts, all, conquered by this single law, rise upward, and brood like beneficent deities above the city—which one of them alone would suffice to destroy—then penetrate peacefully into the humblest dwellings, obedient, as you have now seen, even to the hand of a child, who says to the torrent, "Gush forth," "Cease to flow," and the torrent flows or ceases at his bidding.'

'It is indeed strange, papa. But what is the second enemy which man has brought into his service?'

'I have named it to you already.'

'Just now?'

'Yes, a few minutes ago: I even described it to you in the most terrible development of its power.'

'Is it, then, very terrible?'

'Yes: so terrible, that— Take care! it is springing upon you!' A log of wood had rolled from the hearth.

'Ah, you mean fire,' laughingly exclaimed the child, as he replaced the log upon the hearth.

'Yes, fire: to name it is to describe it. What an enemy! Water dissolves—but slowly. Fire destroys in a moment: its touch wounds, and its wound is torture. Water can kill, but yet we can dwell on its surface: we constrain it to bear us; and in order to destroy life, it must enter our mouth and stop our breath. But fire! whatever place it touches, it destroys; whatever member it attacks, it devours. There are a thousand modes of defence against the perils of water—a dike of stones, a wooden roof, iron, straw even can shield us from its injuries. But what mighty power can check the progress of fire? If you oppose it with wood, the feeble barrier will only serve as fuel to the flame; with iron, the hard metal will melt beneath the blaze; with stone, the stubborn rock itself will pulverise when exposed to the action of this resistless agent. And to accomplish all this, it need not fall like the rain in torrents from the heavens: one spark lodged in a stately edifice is enough. Leave it but a few hours of silent incubation, and it will burst forth a resistless conqueror; yes, and march onwards, too, to the destruction of the city itself, whilst houses, palaces, and temples feed its destructive fury. And yet

this is the guest whom man has dared to introduce into his home. Fire is mingled with every act of our life—it supplies all our wants, it has aided in the construction of this very room in which we are sitting: fire has made glass for our windows and our mirrors, fire has prepared the lime which cements our walls, fire has hardened the tiles which cover our roof, fire has been used in the fabrication of our locks and bolts, and even of our fire-irons; without fire, we should have no brilliantly-dyed wool for our carpets and curtains, without it, no mode of cooking our food. What more vivid picture of misery can we give than by that expression, "they are without fire?" What more cheering picture of domestic happiness than by that simple word, "the fireside?" Would it not be supposed that we spoke of a friend?—but yet a friend before whom we stood in awe. How many precautions against this friendly foe! A place apart, built expressly for his use; a hearth formed of materials which have all been hardened against his power; and yet even in the midst of all these precautions, how often the unchained enemy bursts forth, and casts around him firebrands and death! Or if his fury is kept in subjection, does he not often exhale a corrosive poison, which, diffusing itself all around, attacks his conqueror in every one of his senses—sight, smell, breath—soils his garments, and destroys the freshness and beauty of all around? You will have already guessed that this is smoke. And what must be done to snatch this remaining power from our rebellious enemy? How best constrain him only to be useful? It would be a difficult, almost an impossible task, if we had not discovered and enlisted in our behalf a powerful ally, a mysterious combatant, who will come to our aid, and complete our conquest.

'And who is this ally, papa?'

'Who is it, my child—who? A third enemy!'

'A third enemy!'

'Yes, have I not promised you several? And the appearance of this new adversary on the scene will now add to your pleasure, by making the combat more complicated, and by placing before you in a new light the adroitness of man. You were reading the other day the history of the elephant?'

'Yes, papa.'

'Do you remember the method employed by the Indians to capture the wild elephants?'

'Oh yes, indeed I do; it was so curious. They make use of tame elephants, which they lead out into the forest: the wild elephants come during the night to join their former comrades; and when the latter, driven home by their keepers, return to the town, the others follow them.'

'Well, this is just what man has done also with regard to the formidable guests whom he has admitted into his dwelling. He subdues the one by means of the other, and each becomes his servant. Let us take water, for instance. Water, such as Heaven has bestowed it upon us, is certainly a great blessing; but under the action of fire, its utility is increased tenfold. Fire warms it, and it serves for our baths—fire heats it yet more, and it prepares our food—fire makes it 'boil, and changing into steam, it becomes one of the great agents in modern civilisation. And thus does fire subdue water to our use. But how is fire to be brought into subjection to us? How shall we get rid of this troublesome smoke which it produces seemingly on purpose to annoy us? Let us call our third enemy to our aid; and thanks to him, we shall become masters of this indomitable flame: we shall be able to excite, to guide, to check it.'

'And this new combatant is the air: is it not?'

'Exactly; it is the air.'

'But the air is not our enemy, is it?'

'Don't you think so? Only open the window when it is very cold; go out into the streets when a violent storm blows down the chimney tops, and carries off the tiles from our roofs; plant young trees upon those heights where the tempest uproots even the full-grown pine; or embark upon the ocean during the stormy gales of the equinox. Do you not allow that, under such circumstances, it is one of our most unrelenting foes? Well, now, let us view it in its conflict with fire. Man has discovered one most important law of air—namely, that it becomes lighter in proportion to its warmth, and that it rises in proportion to its lightness. This single fact is sufficient, practically applied, to rid us of the annoyance of smoke. What is smoke?—a heated air. What is the external atmosphere?—a heavier and colder air. What, in this case, is the resource of man? He introduces the latter into his house, and it enters into

conflict with the smoke, and forces it up the chimney. Thus one enemy rids you of the other. But while air in the hands of man subdues, it at the same time excites this enemy, stops its ravages, and doubles its power.'

'Explain to me, papa, how that can be?'

'I daresay you have remarked that a candle or a piece of wood burns much more quickly in the open air than in a room?'

'Yes.'

'I will tell you how that is. Every body which is consumed unites itself so closely to a gas called oxygen, that the two substances become confounded together. For instance, as soon as yonder charcoal is sufficiently heated, it attracts to itself all the particles of oxygen which surround it; each of these particles flies to it with avidity, seizes one of its atoms, transforms it into gas, and they escape together. Thus is it that the wood is consumed, and thus also it imparts heat; for heat is only the result of the movement caused by these rapid combinations. To burn wood is to marry it to air; and to kindle fire into increased activity, it is only needful to supply it with an increased flow of oxygen. And how has man contrived to effect this? It was needful for him to have within his reach a little magazine of air in some light, portable machine, which in one moment could collect a certain quantity of this gas, and then, by forcing it through a narrow tube, give fresh vigour to the flame. This has been accomplished by the simple device of a pair of bellows; and I never can behold the fire thus kindling into a flame without a certain feeling of interest almost amounting to admiration. This slumbering power which is awakened, this flame bursting into life beneath the quickening influence of air, this black mass kindling into brilliancy, these thousand phenomena of sound, colour, metamorphosis, and destruction, attract the attention even of the most ignorant man towards the magic spectacle with which his own hearth presents him. Nor has the power of man over this formidable enemy ceased even here; there seems to be no pause in his career of triumph: he has ventured to play the part of Prometheus—he has learned to create fire. Daily do we see this wonderful miracle accomplished, until, from its frequency, it has ceased to excite our astonishment. Man retains within his grasp the celestial spark, harmless and concealed, but not the less powerful and ready to burst forth in obedience to his will. He issues his command, and the flame kindles into life. And how is this to be accomplished? With the aid of a tiny implement, of the lowest price, small in compass, unassuming in name, but which is fitted to excite the admiration of every thinking man—a match!'

After some moments of silence, my son began, 'Well, papa, what next?'

'I will mention two more, and they are yet more extraordinary, and still more difficult to subdue. Sometimes when the workman in a coal-mine has reached the last round of the long ladder which leads him to the scene of his subterranean labours, he suddenly encounters a poisonous and stifling odour; his throat becomes dry, his brain dizzy, a sort of vertigo makes his steps falter; his lamp no longer burns with clear brightness, but emits a bluish sickly flame. Soon a strange crackling sound makes itself heard through every crevice of the rock—the flame becomes yet more blue—the miner's weakness and his dizziness increase—he seeks to regain the fresh air, and makes one step towards the opening, but, alas, it is too late! Suddenly a powerful explosion bursts around him: there is first a blaze of light, then utter darkness, the vaults are in fragments, the galleries crushed, the miner sinks upon the ground.'....

'And does it kill him, papa?'

'Yes, my child.'

'And what has been the cause of all this? What was this poisonous air which made the flame turn blue, and everything explode?'

'This fatal breath, my child, is the gas which gives us light in our homes, and which illuminates our streets. What can be grander than this thought! Here is a body with which man first becomes acquainted only by means of its disastrous consequences. This body stifles, suffocates, destroys him. Well, in the midst of all this complicated evil, man sees but one fact—this body gives light! Smitten by its power, he does not shrink back from its terrors in dismay, but rather opens his walls, to afford it a free passage, and brings it into his dwellings, into his cities. And yet death is ever lurking in its track: an

unperceived opening in the tubes, a candle imprudently brought into contact with some fissure whence the gas escapes, may cause all to explode, and spread ruin around. But what matters it to man? He sought to subdue light as well as heat; he desired that 'a' too, like water, should gush forth at his command; and lo! through every quarter of the city this bluish flame, so long his mortal enemy, and which nature seemed to have concealed within her depths as a guardian genius to watch over her subterranean treasures—this spirit of the dark caverns of the earth bursts forth in columns and fountains of light, and casts new brilliancy on all around. Can you not see in your mind's eye those endless subterranean tubes which intersect the city, winding in all directions like the veins and arteries of the human frame? Do you know what flows through these tubes? It is the life-blood of the city—fire, water, and electricity. Yes, electricity! for here is a fifth enemy—a fifth conquered enemy, whom, until now, we have left in oblivion. And this enemy we have not sought in the bowels of the earth; we have brought it down to earth from the very heavens themselves. This electricity, when it became inflamed in the stormy plains of air, fell upon the head of man with destructive power; man with his loaded needle drew it from the clouds, and forcing it to descend, like a thread of water, along an iron rod, has conducted it harmlessly to the ground beneath his feet. But it did not suffice him to have shorn it of its destructive power; he would also it should serve him; and grasping it in its rapid course, he confides to these wings of flame the transport of his news, and takes the lightning for his messenger! Are not these fruitful subjects for meditation? and does not man, in the midst of his cities and his houses, surrounded by these five formidable enemies, appear in our eyes such as he was represented by the poets of olden time—surrounded by subjugated lions, tigers crouching beneath his feet, and serpents robbed of their poisonous fangs—king, in fact, of creation, but of a creation transformed beneath his touch, and created anew for his benefit?

The boy remained silent; but the earnest glance of his eye bespoke his deep attention, and from that day forward, I perceived that the phenomena of nature awakened an interest in his mind which they had never before seemed to have possessed.

TRUTH AND GOOD-FEELING FROM ROYAL LIPS.

[Speech of Prince Albert at the annual meeting of the Society for the Improvement of the Condition of the Labouring Classes, May 18.]

LADIES and gentlemen, when, four years since, this Society for the Improvement of the Condition of the Labouring Classes was first established on its present footing, I accepted with pleasure the offer made me of becoming its president. I saw in this offer a proof of the appreciation the Society entertained of my feelings, my sympathy, and my interest for that class of our community which has most of the toil and least of the enjoyments of the world. I conceived that great advantage would accrue to it from the endeavours of influential people, who were wholly disinterested, to act the part of friends to those who required advice and assistance, which only a friend could tender with advantage. The Society has always held this object before its eyes, and has ever been labouring in that direction. You are all aware that it was established to erect model lodging-houses, loan funds, and the allotment of land in different parts of the country; but it has been careful only to establish examples and models, mindful that any real improvement which was to take place must be the result of the exertions of the working-people themselves. I have just come from the model lodging-house, the opening of which we celebrate this day; and I feel convinced that its existence will by degrees lead to the erection of others, and that it will lead to a complete change in the domestic comforts of the working-classes, as it will exhibit to them that with real economy can be combined advantages and comforts to which they have hitherto been strangers, whilst it will at the same time show those who possess capital, which they are desirous to invest, that they may do so in connection with this institution with great advantage and profit to themselves, dispensing at the same time those comforts which I have enumerated to their poorer brethren. Depend upon it, it is for the advantage of those classes who are so often contrasted, but whose interests are identical, to unite; and it is only ignorance which prevents them uniting for each

other's benefit. To dispel that ignorance, and to show the means how man can help man, notwithstanding the complicated state of civilised society, ought to be the aim of every philanthropic person. But it is most peculiarly the duty of those who, under the blessing of Divine Providence, enjoy station, wealth, and education. Let them be careful how to avoid any dictatorial interference with labour and employment, which frightens away capital, destroys that freedom of thought and independence of action which must remain to every one if he is to work out his own happiness, and to repose that confidence in each other on which alone the enjoyment and mutual benefit of mankind rest. God has created man imperfect, and left him with many wants, as it were to stimulate each individual to exertion, and to make them all feel that it is only by united exertions and combined action that those imperfections can be supplied, and these wants satisfied—self-reliance and confidence in each other. It is to show the way how these individual exertions can be directed to the greatest benefit, and to foster that confidence upon which the readiness to assist each other depends, that this Society considers as its most sacred aim. There has been no ostentatious display of charity, or of its manifestations—not a protestation to become the arbiter of the fate of thousands, but to aid the working out of practical schemes of public improvement, for which this Society, as I said before, has been established; but it has only as yet established examples for the country at large to follow. The report of the Society, descriptive of its proceedings during the past year, will be laid before you. I must say, I hope I may say, that this Society has proceeded satisfactorily towards the accomplishment of its objects, owing to the particularly kind feeling and great endeavours, and the indefatigable zeal, of Lord Ashley. The next stage that we contemplate is the erection of a model lodging-house for females. I hope this meeting will enable us to carry out that step, and all engage to do the utmost in their power to call the particular attention of the public to the object which we have in view.

AUTUMNAL FLOWERS.

In vain, oh bright autumnal flowers,
Ye lavish on the dying year
Illuse caught from summer's glowing hours—
Ye can but wither here.

Ye give no pleasure to the heart,
Like the pale buds of early spring,
That from the lap of winter start,
And joyful promises bring

Ye have no perfumes, such as dwell
In the ripe rose or jasmine pale;
Or as the lily's snowy bell
Flings to the evening gale.

But every gorgeous tint that lends
A glory to the western heaven,
When there the radiant sun descends,
To you is freely given.

And as each velvet leaf unfolds,
'Tis fraught with lessons brief and sage,
Like those some antique volume holds
On its illumined page.

Teaching that all earth's loveliest things
Are prone to wither and decay;
Or else, like angel guests, have wings—
Spread but to flee away!

CANNON BALLS.

A cannon ball, in its flight invisible to those whom it passes, may be distinctly seen by a person standing behind the piece, and commanding a perspective view of its course. I have often beheld this terrible sight. It conveys to the mind a new and frightful idea of this destructive engine, tearing through the air with the superhuman fury of a demon.

WOMEN'S HUSBANDS.

THE exigencies of life sometimes put the lords of creation into curious predicaments. It so happens that, with all the virtues of our present industrial arrangements, some men can do no good in the world. They try many things, and fail in all, although it is not always easy to see the cause of the failure. The wife has then, if possible, to come forward and undertake the duty of providing for the family, while the worthy man sinks of course into the subordinate position. A terrible time it is when these domestic revolutions take place; seldom short in duration, usually marked by many vicissitudes of rule, and ups and downs of fortune. A vexing problem, too, the superfluous husband usually is to the poor wife. The difficulty is, to get him made perfectly negative and neutral. He would fain be doing, were it only for a show—how to keep him idle! If kept idle, then how to occupy his energies innocuously to the concern in which the wife is engaged! Oh, a sad business it is to have a woman's husband in charge.

Women are naturally shrinking beings, prone to keep back amid the obcurities of kitchens and parlours, while men rough it for them through the outer world. It requires, in general, the impulse of the affections to bring the gentler sex into public life or professional exertion. Of course there is nothing they will not do for their babes—nature has taken good care of that point. The upper classes, who never see women working but at gewgaws for ecclesiastical purposes, can little imagine what is in the heart of a poor wife in the middle ranks of society, when, after years of suffering, the consequence of failure on her husband's part to produce a livelihood, she comes out from her humble retirement, to struggle for dear life to her household. Duty, one would say, can never be a degradation; yet duties are a second nature, and to break through the fine veil of matronly privacy which she has been accustomed to draw between her and the world, cannot be attended with pain. The reward afforded by the consciousness of performing a duty is confessedly sweet; yet who does not know that the world pays more homage to the dignity which has no duty to perform, than to the humility which knows nothing but duty on earth? Dear conventionalities, which we daily condemn, and momentarily worship, and evermore cling to, you it is which make it bitter for even a mother to battle for her sucklings. We verily believe the lioness herself, when she fronts danger for her cubs, has some sacrifice of feeling to make. Even she must feel the like position.

But what use to talk? It is but a part of the tragic character ever mingling with this social life of ours, that beings born for all gentleness should occasionally be forced, weeping, trembling, oft looking back, into the

mêlée, there to clutch at what they may get, in part for those who ought to be the means of sparing their cheeks from the too rough visits of the wind. No help for it. Our world says that a lady shall not even set in a chair for herself if a man be by, yet leaves the same person to drudge unassisted for the mouthful required for herself and offspring, whether she be a widow, or, what is sometimes worse, a wife whose husband cannot gain her bread. There are her young ones—there the husband, willing perhaps, but inefficient—there the ill-replenished house, fast dimming in the cold shade of adversity. Friends worn out—how soon they wear! Debts pressing. Shades of 'last resources' standing three deep, and not another substantial one in view. There is no longer any choice. If educated, she must take to schooling; if not, to some grosser business—keeping lodgers or boarders, or a shop, or an inn; things much to be determined by circumstances, as well as tastes. The first steps are usually the most difficult, not merely as regards means, but with respect to inclinations. After a commencement has been made, and some success attained, the pain deadens. Former connections cease to be remembered unpleasantly—the excitement of activity becomes its own reward—the mind gets accommodated more or less to its new conditions. Still there is much encountered and undergone which the world does not see; and of this the husband generally bears no small part.

It is bad enough when this personage is tolerably rational, and limits his ambition to keeping the books of the concern, and attending to such other little duties as he is fit for and his wife finds he may be intrusted with. Even in these favourable circumstances, it is not easy to keep him right, for he can scarcely fail to be the worse of the half idleness to which he must needs be assigned. If, indeed, he be an old man, he may walk genteelly about, haunt the reading-room, and talk learnedly of stocks and markets in which he has not one penny of interest. Sometimes he may be allowed to cater or act on little commissions, or even, completing the reversal of the sexes, take a general charge of the house, thus sparing time to his wife, which she may bestow upon her business. But never in any circumstances does he prove otherwise than a source of anxiety and trouble. The fact is, he is no one thing rightly, and it is impossible to put him in his proper place. Servants, children, customers, all mistake him. He scarcely knows what he is himself, but only has a vague sense of being treated less reverently than is his due. The wife has therefore, in addition to all other duties, to manage her husband's self-respect. She must contrive to maintain a useless man, in the impression that he is useful. She must shape her own course, so as to prevent possibilities of his interfering with or thwarting it.

Matters are much determined by the degree of self-complacency possessed by the gentleman. It is to the last degree unfortunate if he be ill endowed in this respect, for then is he continually getting rubs, for which an incessant application of the soothing salve is necessary. If, on the contrary, on good terms with himself, there is comparatively little difficulty. He then feels as much master as ever. Sitting in his chair over his book or his newspaper, and emitting a word of sage advice or remark now and then, he believes that in reality he directs everything, while the lady is a mere instrument. Speaking of home affairs to any one else, he seems only to allow his wife to enter into certain engagements, in which he does not choose to interfere: it never appears as if she were in any respect the centre of the family system. As the children rise up, and take successively to industrious courses, they must all likewise become planetary to him. This kind of man maintains a dignified and gentlemanlike appearance before the world; no great freshness of attire perhaps, but a good presence and a clean neck-cloth; always very well-bred, often a favourite, on account of his agreeable company. You might meet him frequently without ever supposing him to be anything but a gentleman possessed of a quiet little competency, who took to newspapers and constitutional walks from choice. On falling into conversation with him, you find him more given to talk of public than of private matters. He speaks of 'supporting' Sir Robert Peel, the reason being, that Sir Robert 'is such a financier.' Modern men of business he holds in something like contempt; they do not conduct matters in a gentlemanly way, all seeking to undersell each other. He worships some ideal, which the shabby practices of the world have not allowed him to reach. If you ever find out what he really is, you are left to infer that it is not he who is to blame for his not being a rich fellow enough.

In a large class of cases the woman's husband is a less estimable, or at least harmless member of society. His constantly drinking his pocket-money may be the gentlest of his weaknesses. A tendency to make foolish intrusions upon his wife when she is engaged with those by whose patronage she gains the family bread—thus humiliating her in their eyes, and perhaps offending them—is not the worst kind of action he is noted for. What struggles poor women often have to keep up decent appearances, and sustain their exertions, while secretly tormented with an indiscreet associate of this kind!—the story of the actor playing his part while the stolen fox was gnawing his bosom under his cloak, is but a type of the case. The little fabric of success reared with labour and difficulty inexpressible, is continually liable to ruin at the hands of the domestic ogre, who himself perhaps enjoys the largest share of its results. He eats his bread and butter, and threatens the life of her who lays it before him. 'Swamp the whole concern!' was the tipsy cry of such a man with reference to a little business which his wife carried on, and which somehow aggrieved him. We see here all the evils of lunacy, while yet the patient is not in a state which entitles others to reduce him to harmlessness. He must be flattered out of his maudlin furies, and allowed to have his will by way of bribery, when he ought rather to be manacled and strait-waistcoated. In his partner, all the time, there is one struggle going on in addition to all others, between the relics of old affection, or the sense of decency towards her children and the world, and the heaving throes of disgust at conduct from which her womanly worth and delicacy revolt. Hard, hard indeed is the fate of some women! To look at a gay assemblage of young ones, and think that some of these happy creatures are yet to groan out a weary life as the slaves of debased fatuous tyrants, with that terrible perplexity which arises in such circumstances from children—no help to be expected from any bystander, no more than to Sinbad when he was about to be lowered into the sepulchre with his dead wife—no relief to be

looked for, till the weariness of wo shall sink her into the grave, a broken-down unrecognisable thing; who, in doing so, can say that all our social arrangements are quite right? Who does not see the wrongs which the selfishness of society inflicts on individuals, or at least tolerates and sanctions for its own ends? Yet we talk of the martyr-burnings of former ages, as if all such sacrifices to mistaken views were past!

Perhaps existing circumstances in our island are not just to 'women's husbands.' Should we ever come to have a National Guard, they would probably shine out in a very different light, being highly qualified to act the part of officers in such a band. In the event of a new organisation of labour after the plans of Louis Blanc, they would be found not less qualified for the more conspicuous situations, being remarkably well adapted to work out the ideas of that Lilliputian philosopher. We would have the ladies to think of it, both on account of the pay, tending to lighten their own labours, and because nothing keeps the true 'woman's husband' so well in temper, as to think he is doing something, while in reality he is doing nothing.

THE PHOTOGRAPHIC ART.

INVENTIVE genius seldom fails in exciting our admiration; and the history of a new discovery, after it has been a few years before the public, is highly interesting, affording as it does the means of tracing the gradual development and growth of thought from a crude and often accidental germ into shape and form, until at last science seizes upon it, and gives it a practical direction. This is peculiarly the case with regard to photography, an art involving some of the profoundest philosophical speculations and experiences, intimately connected with problems whose solution promises extraordinary triumphs for science. Considering the persevering industry with which experiments on light are now conducted in various parts of Europe, we may look for results which shall let us farther and farther into the secret of many as yet inexplicable phenomena.

In the spirit of some laborious investigators, we might go back to remotest antiquity for the origin of photography, and find it in the knowledge of the action of light possessed by the Egyptians, or detect it again in the magic mirrors and similar juggleries of the middle ages. We may, however, fairly assume the days of Giambattista della Porta, a Neapolitan,* and the discovery of the *camera obscura* (darkened chamber), as our starting-point. Porta had noticed that external objects were reflected on the wall of a darkened room when the light was admitted through a small aperture. Following up the inquiry thus opened to him, he contrived the fitting of a lens to a movable box, and in this way produced the instrument which has suggested greater things, which to the draughtsman and photographer is invaluable. As was usual in that day, Porta incurred the displeasure of the priestly authorities, by whom he was censured as a meddler in supernatural affairs.

Fabricius, in his work 'De Rebus Metallicis,' published in 1566, mentions a kind of silver ore which, on exposure to light, lost its natural colour, yellowish-gray, and became of a violet colour, which afterwards deepened into black. The same substance is referred to in the writings of some of the alchemists: they appear to have been acquainted with the effects of light on paper prepared with the metal. About 1770, the celebrated Scheele tried some experiments in connection with the subject; and a year or two later, Petit, a Frenchman, observed that 'nitrate of potash and muriate of ammonia crystallised more actively in the light than in darkness.' Other discoveries followed; and about the beginning of the present century, attempts were made by Wedgwood and Davy to copy profiles, and transfer from paper to glass by the action of light. They could not, however, succeed in

* Photography: a Popular Treatise, designed to convey Correct General Information concerning the Discoverers Niepce, Daguerre, Talbot, and others. By an Amateur. Brighton. 1847.

rendering their pictures permanent: no sooner were they produced, than they vanished.

Niepce's is the next name that occurs: he was living at Chalon-sur-Saône when, in 1814, he detected the action of light upon resinous substances. He coated a silvered plate of pewter with vapour of asphalt; the plate being then placed in the camera, received an *invisible* impression of the objects placed before it, and the latent picture was brought out by an application of oil of lavender and oil of petroleum. Niepce came to England, hoping to gain attention and patronage; but failing in this, he returned to France, where he made various improvements in the process, which he described 'as the method of fixing the image of objects by the action of light,' and to which he gave the general name of heliography, or sun-painting. The 'fixing' was a most important step gained, as the previous experiments had failed in this essential point. Subsequently, a year or two before his death, Niepce became acquainted with Daguerre; and further investigations were conducted with such success, that in 1839 the latter had, so to speak, perfected the process, for which the French government awarded to him a pension of 6000 francs, and another of 4000 francs to Niepce's son: the secret thus became public property. In the same year, our countryman Mr H. Fox Talbot communicated a paper to the Royal Society 'on the Art of Photogenic Drawing'—a remarkable instance of coincident invention and discovery. No communication had taken place between the parties, and Mr Talbot is said to have commenced his researches into photography in 1834.

Niepce's process occupied from two to six hours; but such have been the progressive improvements, that the operation is now instantaneous: formerly, the picture was as the bloom on the grape, liable to obliteration on the slightest touch; now, the impressions are permanent. The process of sun-painting at the present day is thus described:—The silver tablet is first carefully cleaned and highly polished; it is then coated by the vapour of iodine, and afterwards exposed to that of chlorine or bromine: the proper focus of the object having been obtained, the plate is in darkness inserted in the place of the ground-glass screen of the camera obscura; the aperture of the camera is opened to admit the image, for a time decided by preceding experiments and the judgment of the artist, and then closed; the plate is removed (still excluded from light), and placed in a box with mercury slightly heated, to expedite volatilisation, until the picture, which before would not have been perceptible, is fully and clearly developed; finally, the type-invested surface is subjected to the solution of hyposulphate of soda, for the removal of iodine, so that there shall remain upon the plate only the mercury which represents the image. The picture being now approved, there is left but to protect it with the solution of gold. Some of the most important improvements in this method of manipulation have been effected by Fizeau and Claudet.

Mr H. F. Talbot's discoveries are not less beautiful than those of Daguerre; in some respects they are preferable, as the pictures are produced on paper from what is termed a negative image, and admit of being copied in endless numbers. The value of this mode of multiplying old drawings, letterpress, correct copies of objects of any kind, will be well appreciated by the artist, naturalist, and antiquary. The sensibility of the paper is caused by repeated soaking in a solution of chloride of silver and common salt. Mr Talbot has also discovered that paper prepared with nitrate of silver, iodide of potassium, acetic and gallic acid, will render a perfect picture in twenty or thirty seconds. Taking the Greek word *kalos* (*beautiful*), he named his process Calotype; with a view, however, of preserving the name of the inventor, it has since been called Talbotype. 'When the photographic recipient is taken from the camera, the picture is not visible, but has to be developed by washing with gallo-nitrate of silver, and by heat. The fixing of a Talbotype is accomplished by washing with a solution of bromide of potassium, or by a bath of hyposulphate of soda, or with a strong brine of common salt. So highly sensitive to light is the Calotype paper, that enlarged

copies of Daguerreotype and Talbotype portraits can be obtained by throwing magnified images of them by means of lenses upon it.' As in the case of Daguerreotype, the quicker the process the better; to expedite it, a heated iron is sometimes applied to the back of the camera: for the production of a perfect image, it is essential that the paper be of uniform texture. The sensitive properties of the paper here described render it highly valuable to travellers, or any one desirous of taking correct impressions of objects. Etchings, too, may be copied by it, and wood blocks prepared for engraving with the utmost accuracy. In fact the field of research thus opened, both useful and curious, is boundless. In some instances the Daguerreotype has been engraved, and an electrotype plate taken from it, by means of the electro-galvanic battery.

The introduction of paper into the photographic art promises to be of considerable service in overcoming the objection which exists in many quarters to a picture on a metallic plate, as in Daguerreotypes. A metallic surface presents many inconveniences, to which cause may probably be attributed the rapid diminution of the excitement and interest created by Arago's announcement of the discovery in 1839. The latest additions to this branch of art, whether practical or philosophical, may be gathered from a paper published in the 'Philosophical Transactions' of the Royal Society for 1847. According to the author, Mr Claudet, it had been observed, from the origin of the invention, that red, orange, and yellow rays exert but a slight influence upon the metal plate. Experiments made by Sir John Herschel, Becquerel, and Dr Draper of New York, have led to the discovery of other interesting properties. The latter gentleman considers that the rays comprehended from the blue to the red, under the powerful sun of Virginia, when separated from the remainder, operated as a check to their action. On this part of the subject the general result of the investigations, which have been extensively carried on, is, that while red rays impede, yellow rays will produce, a photogenic effect. By photogenic effect is meant the bringing of the plate into a state in which it will receive vapour of mercury: the picture or Daguerreotype image is produced solely by the 'affinity for mercury of the parts previously affected by the photogenic rays.'

Most of the experiments here adverted to were made with the pure rays of the prism. Mr Claudet has repeated them, but with coloured glasses, and arrived at various novel and important conclusions. He finds that the red glass absorbs two-thirds, and yellow glass one-half, of the transmitted light. During one of the dense London fogs, when the sun looks like a dark-red disk, a plate was exposed to the dim light: it left a round black image. On another plate, exposed for twenty minutes, a long black stripe was produced, marking the sun's passage; but there had been no photogenic action in either case. These experiments, while proving that red, orange, and yellow rays destroy the effect of photogenic light, have led to some highly valuable practical and economical results.

It has hitherto been necessary to prepare the plates in the dark, as their sensitiveness would be weakened or destroyed by exposure to light. This precaution may now be dispensed with. The sensitiveness of a plate can be completely restored by exposing it under a red glass for some time before placing it in the camera. 'This possibility,' observes Mr Claudet, 'of preparing plates in open day, offers a great advantage to those who wish to take views or pictures abroad, and who cannot conveniently obtain a dark room. Again, in the case of a plate which has been left too long in the camera obscura, or accidentally exposed to the light, instead of rejecting it, we can restore its sensitiveness by placing it under a red glass. There is still another useful application of this property: if, after one or two minutes' exposure to the mercury, we perceive the image is too rapidly developing, or presenting signs of solarisation, which a practised eye discovers before it is too much advanced, we have only to stop the accumulation of mercury by exposing the plate for a few seconds to the red light, and again place it in the mercury box, to complete the modi-

fications, which give the image all its tones, and the most favourable tint. In truth we may complete all the operations of the Daguerreotype in the open air. . . . The exposure under red glass, necessary to destroy the effect produced by white light, must be a hundred times longer than has been the exposure to white light, that of the orange glass fifty times, and that of the yellow glass only ten times. Thus a plate exposed to white light for a second, will be restored to its former sensitiveness in ten seconds by the yellow glass, in fifty by the orange, and in a hundred by the red.

Thus we find that every ray has its own peculiar action. 'The effect commenced by the blue rays is destroyed by the red and yellow; that which was produced by the red is destroyed by the yellow; the effect of the yellow rays is destroyed by the red; and the effect of the two latter is destroyed by the blue: each radiation destroys the effect of the others.' Mr Claudet is of opinion that the red rays exert an electrical action. From this point of view a wide field is open for investigation, connected, as before observed, with some of the highest questions respecting natural phenomena on which scientific men are now engaged. At all events an ample reward awaits the patient inquirer.

THE FORCE OF HABIT.

BY THOMAS MILLER.

A BRIEF paragraph, announcing the untimely end of the subject of this sketch, went the round of the papers about ten years ago. For the few additional facts woven into the following article I am indebted to a friend, who was well acquainted with the original.

A person must either be out very late or very early before he arrives at a knowledge of half the ways and means of obtaining a livelihood in London—let him search through a long summer-day, and he will never meet with a coffee-stall in the streets, while at midnight scores may be found scattered at the corners of the chief thoroughfares. Under low archways—at the entrance of narrow courts—the foot of the bridges—and even at what in the daytime are the most public and crowded places—may these open-air stalls of refreshment be found, from the midnight hour to the grey dawning in winter, and in summer until about six in the morning. They form a kind of mustering ground, where many wait, from the closing to the opening of the 'gin palaces' (a period seldom exceeding in some neighbourhoods more than two or three hours), and here they regale themselves with coffee, cakes, and bread and butter, until the doors of the halls of drunkenness are again thrown open. So long as there is no very outrageous disturbance, the police pass on, and allow the sons and daughters of night to congregate around these places by scores. But little capital is required to open one of these establishments—a chair, with an awning large enough to shelter the vender and his table from the wet—a few cups and saucers—milk-jug and sugar-basin, with charcoal-pan, kettle, bellows, lantern, and a little coffee, and bread and butter, are all the requisites for a street coffee-stall, many of which have proved most profitable investments.

Near a great central London thoroughfare had old John Nighton stood for above a quarter of a century with his coffee-stall. He began business by selling saloop, a decoction of some kind of sassafras, which, with milk and sugar, formed a welcome beverage for those who could not afford the then costly luxury of coffee. It was not until he had thoroughly established himself, that he ventured to introduce coffee to his superior customers, as he called them, while at the same time he dealt out saloop to the poorer classes; and there is no doubt that he was one of the first who introduced this article amongst his out-of-door customers. Throughout the pleasant nights of summer, and when the winter winds come howling over the bleak bridges, old John was ever to be found at the same spot; and many a belated wanderer smiled, as he came along with

the blinding sleet blowing full in his face, when he saw those little round red fiery eyes in the ruddy grate, which told that they were both watching and keeping the 'pot a-boiling.' Although old John was not a man of many words, he was civil and obliging to all his customers; and a strange lot they were at times, consisting often of the most indifferent characters of both sexes. Sometimes, however, he had a sprinkling of what he called 'bettermost-sort-of-people,' such as returned very late from the theatres, and preferred walking home to hiring a cab, or of young 'swells,' who stopped to light their cigars, or men whose business on the press detained them late, and others who were compelled to be up and out early—but these were exceptions: his principal patrons belonged to a class who neither 'toiled nor spun.' True, there were the poor cabmen, doomed to be out for the night, and the police, who are forbidden to enter any house to refresh themselves whilst on duty: to these, on a bitter winter-night, old John's beverage was indeed acceptable.

A man of great conversational powers would never have got on like old John Nighton: his principal observations were confined to 'A cold morning—Thank you—Fourpence, please—Much obliged—Change, sir'—and all such little matters as solely appertained to business; for those who assembled around his coffee-stall came only for what they wanted, or to inquire after some one they had appointed to meet there, or to converse with one another. Rumour did say that old John was in possession of many secrets, and that rich officers had often been made to him to reveal them; but neither inspector nor sergeant could ever get more out of him than that he 'had enough to do to mind his own business, and to see that his customers paid for what they took.' No one ever remembered seeing the old man out in the daytime: the light seemed to make him drowsy; and he was always thankful when the days began to shorten. He used to wish that the sun rose and set at six all the year round; for that, he argued, would seem natural. If ever he took a bad shilling, he laid the blame to the daylight, which he said 'dazzled his eyes.' He was never known to be a minute behind his time: as the church clock tolled the hour of midnight, the cart, which he himself drew, was sure to be seen in the old accustomed place. At six in the mornings of summer, and seven in winter, he had packed up, and was gone.

For years he had been his own housekeeper; but as age crept upon him, he employed a charwoman, a sharp-looking, talkative little body, who by degrees began to assist at the coffee-stall, and often brought the old man a little something hot and comfortable about four in the morning. Old John never drank his own coffee; he said 'it did not agree with him.' In the course of time the little sharp-eyed woman became Mrs Nighton; and it was observed by many that from that period old John never again looked the man that he once did. One winter John caught a severe cold, and for a whole week, for the first time in his life, he was unable to attend to his business. His wife, however, managed to get through it, though not without a great deal of grumbling, besides telling the customers that it was his own fault—that he had quite enough to go into some other line of business, without exposing himself to the cold and the night air any longer. She also got the customers to reason with her husband about the matter; and they did. Her proposition was, to sell the fixtures and good-will of the coffee-stall, to take a good-sized house, and furnish it, and let it off into lodgings. There were no end of lodgers, who had known the old man for years, ready to come any day and occupy the apartments. Mrs Nighton was delighted—'She had known people make a mint of money in the lodging-house line, and why shouldn't they?' After many a growl and deep-meaning shake of the head, the old man at last allowed himself to be over-persuaded, although he said he knew it would come to no good. He asked £20 for his business, and

declared that it was worth L.100. One day, whilst he was asleep, his wife sold the fixtures and all for L.10; when he awoke, and began to prepare for the night as usual, cart, kettle, charcoal, and all were gone. There was a noise like subsiding thunder heard for above an hour in the house, and it is said that the old man sat growling in his arm-chair, and smoking his pipe at intervals until daylight; nor could all her persuasions induce him to go to bed until his usual bedtime. 'I should be dead in a week,' said he, 'if I broke up my old habits.'

The next day Mrs Nighton took a large twelve-roomed house, and having in the course of the week persuaded her husband to allow her to draw a considerable sum out of the savings' bank, it was soon furnished from cellar to attic. Her next step was to procure a 'thorough' servant; as for lodgers, she had more applications than rooms. The old man never interfered with her arrangements; all he at first did was to steal out in the night, and bemoan the loss of his coffee-stall at the bars of the late night-houses. Sleep he could not, excepting in the daytime; and when he could find no one else to speak to, he accompanied the policemen on their beat, sometimes never once speaking for the hour together. In vain did they tell him that his wife was a sharp, clever woman, and sure to do well—he only shook his head.

Now Mrs Nighton, with all her apparent cunning and calculation, had her weak points, and prided herself on 'taking people by their looks.' Old John would have preferred a good reference with his lodgers, but his better-half 'pooh-poohed;' anybody could get a reference, she said, but an honest-looking face was a gift of nature. She had her own way, and lost by it. Her honest-looking lodgers came and went without paying, and she consoled herself by saying that she knew they would if they could, and that it would be all right enough at last. Wiser people said that it was just what might be expected, and that the riff-raff who wasted their nights in the streets and at coffee-stalls, couldn't be expected to pay for apartments, and that really they could not see of what use lodgings were at all to such-like people. In fact they paid Mrs Nighton back again in her own coin, and said that she knew they were honest.

Meantime the old man had formed an acquaintance with his successor, and now went out night after night, and hovered like a ghost around his old coffee-stall. To and fro he traversed, almost a shadow of his former self, and sometimes when an order was given, he so far forgot himself as to move forward as if to serve; then he passed his hand across his forehead, shook his head, muttered something to himself, and continued his measured march as usual. One morning, as his successor was packing up, and after John had nodded his 'good-by,' the old man turned back and said, 'Twenty-five down; come in to-night.' The new occupier replied, 'No, no; not for double that amount.' John Nighton heaved a deep sigh, and that day could not be persuaded to get up for an hour, as was his general custom at dinner time.

A visible alteration for the worse had already taken place in old John's appearance. His face, which before, through exposure to the wind and weather, looked blue, and purple, and crimson, as if made up of a minglement of all kinds of healthy and lasting colours, now faded into a series of dingy yellows. His clothes, too, which before suited his 'thick rotundity,' now hung about him in loose disorder, 'a world too wide for his shrunk' form; and although he went to bed as usual in the morning, the old familiar sleep visited him not. Punctual as the midnight itself, he was ever found at his former post; and for five weeks in succession did he make an advance of five pounds each week on his original offer; but fifty pounds was not sufficient to buy out the new-come.

Matters grew worse at the lodging-house. Lodger after lodger decamped; and not satisfied with escaping

rent-free, they carried off all they could lay their hands upon. Bed-ticks were found without feathers; pillows, sheets, and blankets were taken away; the very mantel-pieces were plundered of their ornaments: fenders, fire-irons, and hearthrugs vanished as if by magic; and after being pledged, the duplicates were sometimes forwarded to Mrs Nighton, assuring her of their honesty, and promising that they would redeem them as soon as they could. After much 'gnagging and werretting,' she succeeded in driving the old man out in the daytime, giving him strict orders that, if he came in contact with the defaulters, he was at once to call the police and give them in charge. Poor John Nighton! he went out more for the sake of peace and quietness, and to get rid of his wife's incessant clamour, than in the hope of ever retrieving anything from the plunderers.

Behold him at last in the crowded streets of London in the open noon of day! He seemed to wander along like a man in a dream; he was ever running against somebody, then pausing to rub his eyes, and gaze around in astonishment: sometimes he flapped his nose, or pulled his hair, or struck his elbow against the wall, as if doubtful whether he was asleep or not. A dark narrow court was his delight; and where any other person would have been compelled to have groped his way, there he saw all that was going on, and would watch the people passing by for the hour together. His favourite haunt was beneath those gloomy arches on which the Adelphi Terrace is built. He was also often seen to peep down those dark gratings near Waterloo Bridge, where the cellars are five storeys deep. Had he been single, he would have occupied one of these. 'Cool, quiet, and shady,' he used to say; 'a man might sleep there in the daytime.'

After many offers to purchase back his old business, all of which were refused, a bright beam of hope at last shot across his mind—it was the last flicker of the flame before it shot up and expired in the darkness—he would set up in opposition to his rival. A few nights after, he was seen stationed at the end of a neighbouring street, at a spot which few people passed in the night. For a whole fortnight he stood his ground manfully, although he was scarcely visited by a single customer; the few who approached only cried shame on him for selling his business, and then attempting to injure the purchaser. Even those who had stolen his goods refused to deal with him, and went so far as to justify their conduct by his own.

On reaching home one morning his wife was missing; and two or three days passed away and no tidings came; but at length a letter arrived stating that her former husband had returned from transportation, and as she always had a liking for him, they had set sail together for America. The little that remained in the savings' bank she had drawn out before her departure, leaving also the half-year's rent, besides a considerable amount of taxes, unpaid. This last blow was too much for the old man: what remained of his goods was seized and sold, and from that hour he went wandering about like a restless spirit during the day, and at night occupied his new position with his coffee-stall at the corner of the court. This lasted but for a few nights; no one came near him saving the policeman, and he once or twice found the old man fast asleep in his chair.

One night they missed him at the 'accustomed place;' inquiries were made at the little house up the court where he lodged: he went out at 'dark-hour,' and had not returned. Tidings came next day that an old man answering to his description had been seen late at night wandering on Blackheath; another day passed without bringing any further rumour of his 'where-about.'

At length a notice was stuck up at the police station that the body of an old man had been discovered suspended from a beam in a ruinous outhouse near Lewis-ham. Old John Nighton had hanged himself; he had fulfilled his own prophecy, for from the very night when

he was first deprived of his coffee-stall, he had been heard to say that he was a doomed man, that he knew his own habits better than anybody, and should never be happy again. He was like one of those climbing-plants which only thrive whilst they twine and turn from the sun; and which, when forced against their nature to meet the light, droop, decay, and die. According to the doctrine of Pythagoras, he might have existed in a previous state either as a bat, a badger, or a mole, for he loved darkness better than the light.

SAVAGE VIEWS OF CIVILISATION.

In the remarkable age in which it is our fortune to live, there are other mysteries cleared up besides those of science, and we become daily familiar with marvels as extraordinary as those depending on the laws of inorganic matter. We not only behold acted before our eyes those important passages which we formerly read of in the chronological romances called history—we not only observe the progress of mighty revolutions, and are able to detect their springs, and trace the working of their machinery—but, going back to the very origin of society, we see tents and huts rising into towns and palaces, and tribes of wild men ripening into civilisation, and surrounded with all the pride, pomp, and circumstance of regular government. In the North Pacific, the Sandwich Islands, which, when discovered only seventy years ago, were peopled with whooping savages, have already a parliament of lords and commons, and ministers of state and justice; and the granddaughter—if not the daughter—of one of their naked Venuses is described by a missionary as an elegant lady, reclining on a couch of yellow damask, with a richly-covered table before her, strewn with books and papers, including a Hawaiian version of the Gospel of St Luke, and writing (poetry or romance, for aught we know!) in a blank volume.

But although we are thus able to watch from the very commencement—as if it were an experiment in science, instituted for the gratification of our philosophical curiosity—the progress of human beings in the social state, and the general sequence of history, we have not the same facilities for observing ourselves. In addition to the usual effect of self-esteem, we are blinded by the glare and glitter in which we live. We confound moral with political elevation, and fancy that all good qualities are necessarily comprehended in our greatness, and that where greatness is wanting, there cannot possibly be anything good. Would it not be an admirable thing if our advantages of observation were enjoyed, as regards ourselves, by a *savage*!—if he could see us with his ingenuous eyes, judge of us with his untutored mind, and report of us with his truthful lips? Yes, it would be an admirable thing; and therefore—for nothing, however strange or wonderful, is denied to the spoiled children of this generation—therefore it has come to pass!

Our readers may remember that, on the appearance of the book, we noticed at some length Mr Catlin's narrative of travels in his native America, in the course of which he completely domesticated himself with the Red Men, and collected an unparalleled museum illustrative of the minutest peculiarities of Indian life and manners.* This gentleman brought his collection to England, where it attracted a good deal of attention; till it was suddenly and unexpectedly enriched by the addition of some living curiosities, which gave spirit and reality to the whole. These were nine Ojibbeway savages brought to this country for the purpose of exhibition. After the termination of Mr Catlin's arrangement with them, he became the patron of fourteen Ioway Indians, who had found their way hither from the great plains between the Missouri and the Rocky Mountains; and finally of another party of eleven Ojibbeways, whom he exhibited in France and Belgium. Among these thirty-

four individuals there were several possessing considerable native talent and power of observation; and in a new work, Mr Catlin has included the impressions made upon them by the Pale faces.* We have thus realised a great desideratum in philosophy. Hitherto, we have regarded savage life with the eyes of civilisation: now we are able to observe civilised life through the eyes of a savage. Perhaps the very inability of our author to philosophise adds value to his work. It is a book of facts, not of theories; it is full of human kindness, not of controversy; and its simple details are related in language as simple.

As for the two tribes of observers, they appear to have been alike distinguished by innate goodness of character, although their manners were very different. When the Ojibbeways first entered the exhibition hall, where the portraits of several hundred chiefs, painted by Mr Catlin from the life, were hanging on the walls, they 'set up the most frightful yells, and made the whole neighbourhood ring with their howlings; running up to offer their hands to their friends, and brandishing their tomahawks at their enemies as they sounded the war-whoop. The Ioways, on the other hand, shrouded in their pictured robes, 'walked silently and slowly to the middle of the room, with their hands over their mouths, denoting silence and surprise.' They looked long around them before speaking; and when they began to exchange their thoughts, it was at first in a whisper. Mr Catlin's opening proceeding with both was to exact a promise that, while under his protection, they would not drink 'fire-water; an engagement which they kept with the strictest honour; the spokesman of the first party remarking that they had been told at home that this beverage was sent to them by the Great Spirit because he loved them; although they had since learned that this was not true, and that the wise English did not drink it. In this latter piece of information they were not more fortunate than in the other; for on going immediately after to visit the mayor of Manchester, 'they saw him and his squaw, and many other beautiful squaws, all drinking; and they saw many people through the windows, and in the doors, as they passed along the streets, who were drinking; and they saw several persons in the streets who were quite drunk, and two or three lying down in the streets like pigs; and they thought the people of Manchester loved much to drink liquor.'

In London, as well as in the provinces, they were amazed by the constantly-recurring exhibitions of drunkenness and poverty, and were much affected by the degradation of two Indians like themselves, as they supposed the Lascars to be, who were sweeping the crossings of the street. Their reception at court, however, which they had anxiously waited for, put all unpleasant ideas out of their heads, although they were afterwards ashamed to find that they had taken the porter of the palace, in his scarlet, and gold lace, and powdered wig, for nothing less than a king; and that their chief, not knowing how so splendid a personage should be accosted, had given him his hand. While waiting anxiously in an anteroom, they paraded before the mirrors to adjust their feathers and ornaments; but when at length it was announced that the Queen was ready to receive them, there was a moment of jingling and rattling of trinkets as the Indians were throwing on their robes and gathering up their weapons; and when they responded to Mr Catlin's question, 'if they were all ready?' by their '*How—how—how!*' he led the way, and they followed into the Waterloo Gallery. They were of course kindly received by her Majesty and the distinguished persons round her. The Queen beckoned a little girl to approach, and 'held her for some time by both hands, evidently much pleased

with her appearance.' After the war-dance, the old chief, a man seventy-five years of age, who was struck with confusion on the idea suddenly presenting itself that it would be absurd to present the pipe of peace to a woman, said a few words, apologising, on the score of bad health, for being unfit to make a speech. 'The War-chief then rose, and in a very energetic manner made the following speech, which was also literally interpreted to her Majesty:—

'Great Mother—The Great Spirit has been kind to us, your children, in protecting us on our long journey here. And we are now happy that we are allowed to see your face. It makes our hearts glad to see the faces of so many Saganoshes (English) in this country, and all wearing such pleasant looks. We think the people here must be very happy.

'Mother—We have been often told that there was a great fire in this country; that its light shone across the great water; and we see now where this great light arises. We believe that it shines from this great wigwam to all the world.

'Mother—We have seen many strange things since we came to this country. We see that your wigwams are large, and the light that is in them is bright. Our wigwams are small, and our light is not strong. We are not rich, but yet we have plenty of food to eat.

'Mother—Myself and my friends here are your friends—your children. We have used our weapons against your enemies. And for many years we have received liberal presents from this country, which have made us quite happy and comfortable in our wigwams.

'Mother—The chief who has just spoken, and myself, have fought and bled by the side of the greatest warrior who ever lived—Tecumseh.

'Mother—Our hearts are glad at what we have this day seen—that we have been allowed to see your face. And when we get home, our words will be listened to in the councils of our nation.

'This is all I have to say.'

After a gracious reply, and another dance, the Indians at the same moment shouldered their robes and retired, sounding their war-whoop, to the amusement of the servants of the household, who had assembled to the amount of some hundreds in the galleries of the hall.

They were now feasted on roast-beef in another apartment, the carving being executed by the Hon. C. A. Murray, who in due time proposed that they should comply with the English custom at public dinners, and drink the Queen's health. 'For this the first bottle of champagne was opened; and when the cork flew, and the wine was pouring into glasses, the Indians pronounced the word "*Chick-a-bob-boo!*" and had a great laugh. A foaming glass of it was set before each Indian; and when it was proposed to drink to her Majesty's health, they all refused. I explained to Mr Murray the promise they were under to drink no spirituous liquor while in the kingdom. Mr Murray applauded their noble resolution, but said at the same time that this was not *spirituous liquor*—it was a light wine, and could not hurt them; and it would be the only time they could drink to her Majesty so properly, and her Majesty's health could not be refused by her Majesty's subjects. When again urged, they still refused, saying, "We no drink—can't drink." They seemed, however, to be referring it to me, as all eyes were alternately upon me and upon their glasses, when I said to them, "Yes, my good fellows, drink; it will not hurt you. The promise you have made to Mr Rankin and myself will not be broken; it did not contemplate a case like this, where it is necessary to drink the Queen's health. And again, this is *champagne*, and not *spirituous liquor*, which you have solemnly promised to avoid." "How—how—how!" they all responded, and with great delight all joined in "health to the Queen!" And as each glass was emptied to the bottom, they smacked their lips, again pronouncing the word "*Chick-a-bob-boo—chick-a-bob-boo!*" with a roar of laughter among themselves.'

On their return to their lodgings, they conversed much on their important interview, and were evidently disappointed in the personal appearance and dress of the Queen, whom they probably thought little of as compared with the splendid porter. 'They were advancing many curious ideas (over the pipe) as to the government of the greatest and richest country in the world being in the hands of a woman, and she no larger than many of the Indian girls at the age of twelve or thirteen years. I explained to them the manner in which she was entitled to the crown, and also how little a king or queen has actually to do in the government of such a country: that it is chiefly done by her ministers, who are always about her, and men of the greatest talents, and able to advise her. And the old chief, who had been listening attentively to me as he was puffing away at his pipe, said he was inclined to think it was the best thing for the country. "I am not sure," said he, "but it is the safest way; for if this country had a king instead of a queen, he might be ambitious as a great warrior, and lead the country into war with other nations; now, under her government there is peace, and the country is happy." Many jokes were passed upon the old chief for having mistaken the porter Sykes for Prince Albert, and for having brought his pipe of peace back, having been afraid to present it. They had many remarks to make also upon the little girl whom her Majesty took by the hand: they told her she turned pale, and they were afraid she would grow up a white woman. They now, for the first time, thought of the Queen's little children, and wondered they had not seen them. They thought they ought at least to have seen the Prince of Wales.'

Although this party, being the first arrival, excited much attention, and one of them, a handsome young half-breed, captivated the heart of an English girl, whom he eventually married, the Ioways, who succeeded them, were upon the whole more interesting. They were more quiet and sedate, and yet more comical fellows than the others; and the doctor more especially, or the medicine man, was an amusing mixture of shrewdness and simplicity, wisdom and vanity. He was always uneasy, till he got as *high* as he could go. Whether in a carriage or in a house, he must be on the top of it; and this curious propensity caused much alarm at the outset, for no one could imagine where the doctor had bestowed himself, till, after a fruitless search, his friends were directed by the eyes of a crowd in the street, and found him on the roof, perched on a corner of the parapet, wrapped in his buffalo robe, and looking down upon the multitude with the air of a Zealand penguin. This worthy, on his debut at the exhibition, flattered himself that he attracted in a special manner the regards of the ladies, who laughed much at the complacent smiles which he lavished upon them. 'My friends,' said the doctor in his speech, which displayed quite as much wit as simplicity, 'I see the ladies are pleased, and this pleases me; because I know that if they are pleased, they will please the men.'

Among the visitors of the Indians, we need hardly say that there were numerous religious persons, who, delighted with the simplicity and goodness of their characters, wished ardently that they might become still better by a knowledge of the truth. These gentlemen, however, being civilised men, could only see and comprehend the vices of savagism, and were not aware of the impression made upon savages by their own. 'My friends,' replied the War-chief to the first deputation, 'the Great Spirit has sent you to us with kind words, and he has opened our ears to hear them, which we have done. We are glad to see you, and to hear you speak, for we know that you are our friends. What you have said relative to our learning to read and to write, we are sure can do us no good—we are now too old; but for our children, we think it would be well for them to learn; and they are now going to schools in our village, and learning to read and to write. As to the white man's religion which you have

explained, we have heard it told to us in the same way, many times, in our own country, and there are white men and women there now trying to teach it to our people. We do not think your religion good, unless it is so for white people, and this we don't doubt. The Great Spirit has made our skins red, and the forests for us to live in. He has also given us our religion, which has taken our fathers to "the beautiful hunting-grounds," where we wish to meet them. We don't believe that the Great Spirit made us to live with Pale faces in this world, and we think He has intended we should live separate in the world to come.

'My friends, we know that when white men come into our country we are unhappy—the Indians all die, or are driven away before the white men. Our hope is to enjoy our hunting-grounds in the world to come, which white men cannot take from us: we know that our fathers and our mothers have gone there, and we don't know why we should not go there too.' * * *

He here asked for the pipe, and having drawn a few whiffs, proceeded—

'My friends, you speak of the "good book" that you have in your hand; we have many of these in our village; we are told that "all your words about the Son of the Great Spirit are printed in that book, and if we learn to read it, it will make good people of us." I would now ask why it don't make good people of the Pale faces living all around us? They can all read the good book, and they can understand all that the "black-coats"* say, and still we find they are not so honest and so good a people as ours: this we are sure of; such is the case in the country about us; but *here* we have no doubt but the white people, who have so many to preach, and so many books to read, are all honest and good. In *our* country the white people have two faces, and their tongues branch in different ways; we know that this displeases the Great Spirit, and we do not wish to teach it to our children.' In reply to a question, he said, 'We believe the Great Spirit requires us to pray to him, which we do, and to thank him for everything we have that is good. We know that he requires us to speak the truth, to feed the poor, and to love our friends. We don't know of anything more that he demands: he may demand more of white people, but we don't know that.' And in reply to another—'If the Great Spirit sent the small-pox into our country to destroy us, we believe it was to punish us for listening to the false promises of white men. It is white man's disease, and no doubt it was sent amongst white people to punish them for their sins. It never came amongst the Indians until we began to listen to the promises of white men, and to follow their ways: it then came amongst us; and we are not sure but the Great Spirit then sent it to punish us for our foolishness.'

This is no doubt very melancholy, but the fault is not with the Indians. In passing through our streets, they saw multitudes of famishing creatures, 'women with little children all in dirty rags; and some with babies in their arms lying about the doors of public-houses helplessly drunk: they had never seen any Indians in the wilderness half so poor, and looking so sick.' And what was the corollary they drew from this? That it was wrong to send missionaries to the Indians from a country where so many miserable creatures were perishing for want of food and knowledge! This remark was made by a comical savage called Jim; but poor Jim could not even guess at the scenes of unspeakable wretchedness presented by this wealthy country—at the famine, filth, and horrors of all kinds that teem in our streets and lanes: he could not know that the circumstance of people dying among us of absolute starvation, or destroying themselves or others in fits of frantic drunkenness, is too common to excite special notice; and he could not imagine that our missions to his country hardly absorb a twentieth part of the vast sums lavished in Christian charity upon other *distant*

quarters of the world. We remember remonstrating once with a wealthy Quaker on his Society's neglect of the widow of an admirable man who had devoted himself zealously and usefully to co-operation with them in the anti-slavery cause. 'I admit it all,' replied the millionaire; 'he was indeed an admirable man, and his widow is a most deserving woman; but for me, my sympathies are all absorbed—by the hundred millions of India!'

On another occasion, the savages appeared to be a little irritated by their well-meaning religious visitors; for their War-chief roundly told them that all they could say he had heard before from 'more intelligent-looking men.'

'Now, my friends,' said he, 'I will tell you that when we first came over to this country, we thought that where you had so many preachers, so many to read and explain the good book, we should find the white people all good and sober people; but as we travel about, we find this was all a mistake. When we first came over, we thought that white man's religion would make all people good, and we then would have been glad to talk with you, but now we cannot say that we like to do it any more. My friends, I am willing to talk with you, if it can do any good to the hundreds and thousands of poor and hungry people that we see in your streets every day when we ride out. We see hundreds of little children with their naked feet in the snow, and we pity them, for we know they are hungry, and we give them money every time we pass by them. In four days, we have given twenty dollars to hungry children—we give our money only to children. We are told that the fathers of these children are in the houses where they sell fire-water, and are drunk, and in their words they every moment abuse and insult the Great Spirit. You talk about sending black-coats among the Indians; now we have no such poor children among us; we have no such drunkards, or people who abuse the Great Spirit. Indians dare not do so. They pray to the Great Spirit, and he is kind to them. Now we think it would be better for your teachers all to stay at home, and go to work right here in your own streets, where all your good work is wanted. This is my advice. I would rather not say any more.' (To this all responded, 'How—how—how!')

The Indians appear to have liked feasting better than theological discussion. On one occasion they were entertained at Ealing Park by Mrs Lawrence, with a large circle of royal and noble guests, including the Duke and Duchess of Cambridge, with the Princess Mary, the Grand-duke and Duchess of Mecklenburg-Strelitz, the Duchess of Gloucester, and many of the nobility. After dancing and archery, they sat down to dinner, Mr Catlin carving the roast beef, and his Royal Highness, the Princess Mary, and the two Misses Lawrence, waiting at table. 'This unusual scene was taking place in the near vicinity of the poor parquets and cockatoos, who seemed thus far awed into a discreet silence, but were dancing to the right and the left, and busily swinging their heads to and fro, with their eyes and their ears open to all that was said and done. When the cork flew from the first bottle of champagne, the parrots squalled out, "*There—there—there!*" and the Indians as suddenly, "*Chick-a-bob-booo—chick-a-bob-booo!*" Both laughed, and all the party *had* to laugh, at the simultaneous excitement of the parrots and the Indians; and most of them were as ignorant of the language (and of course of the wit of) the one as of the other. "*Chick-a-bob-booo,*" however, was understood at least by the Indians; and their glasses being filled with champagne, the moment they were raising it to their lips, and some had commenced drinking, the cockatoos suddenly squalled out again, "*There—there—there!*" The old doctor, and his superstitious friend Jim, who had not got their glasses quite to their mouths, slowly lowered them upon the table, and turned with the most beseeching looks upon Mr Melody and myself, to know whether they were breaking their vow to us.'

* Clergymen.

This was a delightful day—and a profitable one, for the last course of the entertainment was a tray of trinkets presented to them by their munificent hostess; but they were struck with more enduring astonishment by a visit to one of the prodigious brewhouses of London. They were 'led by one of the proprietors, and an escort of ladies, through the vast labyrinths and mazes, through the immense halls and courts, and under and over the dry-land bridges and arches of this smoking, steeping, and steaming wonder of the world, as they were sure to call it when they got home. When the poor untutored Indians, from the soft and simple prairies of the Missouri, seated themselves upon a beam, and were looking into and contemplating the immensity of a smoking steeping-vat, containing more than 3000 barrels, and were told that there were 130 others, of various dimensions, in the establishment—that the whole edifice covered twelve acres of ground, and that there were necessarily constantly on hand in their cellars 232,000 barrels of ale, and also that this was only one of a great number of breweries in London, and that similar manufactories were in every town in the kingdom, though on a less scale, they began, almost for the first time since their arrival, to evince profound astonishment; and the fermentation in their minds, as to the consistency of white man's teaching of temperance, and manufacturing and selling ale, seemed not less than that which was going on in the vast abyss below them. The pipe was lit and passed around while they were in this contemplative mood; and as their ears were open, they got in the meantime further information of the wonderful modes and operations of this vast machine; and also, in round numbers, read from a report by one of the proprietors, the quantity of ale consumed in the kingdom annually. Upon hearing this, which seemed to cap the climax of all their astonishment, they threw down the pipe, and leaping into an empty vat, suddenly dissipated the pain of their mental calculations by joining in the Medicine (or *Mystery*) Dance. Their yells and screaming, echoing through the vast and vapouring halls, soon brought some hundreds of maltmen, grinders, firers, mashers, ostlers, painters, coopers, &c. peeping through and amongst the blackened timbers and casks, and curling and hissing fumes, completing the scene as the richest model for the infernal regions.'

As a contrast to these scenes of unimaginable wealth and princely generosity, they saw one day a poor old beggar woman and her little child in such miserable rags, as to excite both their sympathy and curiosity. They persuaded her with some difficulty to go up to their room, and seating themselves upon the floor, and lighting the pipe, they went into counsel on her case, in order to discover, if possible, how a white woman and child should be starving to death, with thousands of her own countrymen around her in their fine houses and with all their wealth. The War-chief put five shillings into the shrinking woman's hand, told her not to be afraid, but to observe that it could only be their wish to befriend her. 'We are here poor,' said he, 'and a great way from home, where we also have our little children to feed; but the Great Spirit has been kind to us, and we have enough to eat.' To this the Indians, who were passing the pipe around, all responded, 'How—how—how!' In reply to the questions of the savages, she told a very common story, but one that was full of horror to them. 'The poor Indians, women and all, looked upon this miserable shivering object of pity, in the midst of the wealth and luxuries of civilisation, as a mystery they could not expound; and giving way to impulses that they could feel and appreciate, the women opened their trunks to search for presents for the little child, and by White Cloud's order filled her lap with cold meat and bread sufficient to last them for a day or two. The good old doctor's politeness and sympathy led him to the bottom of the stairs with her, where he made her understand by signs that every morning, when the sun was up to a place

that he pointed to with his hand, if she would come, she would get food enough for herself and her little child as long as they stayed in Birmingham; and he recollected his promise, and made it his especial duty every morning to attend to his pensioners at the hour appointed.'

Another story of this kind we have done. 'It seems that on board of the steamer, as a passenger, was a little girl of twelve years of age, and a stranger to all on board. When on their way, the captain was collecting his passage-money on deck; he came to the little girl for her fare, who told him she had no money, but that she expected to meet her father in Dundee, whom she was going to see, and that he would certainly pay her fare if she could find him. The captain was in a great rage, and abused the child for coming on without the money to pay her fare, and said that he should not let her go ashore, but should hold her a prisoner on board, and take her back to Edinburgh with him. The poor girl was frightened, and cried herself almost into fits. The passengers, of whom there were a great many, all seemed affected by her situation, and began to raise the money amongst them to pay her passage, giving a penny or two a-piece, which, when done, amounted to about a quarter of the sum required. The poor little girl's grief and fear still continued, and the old doctor, standing on deck, wrapped in his robe, and watching all these results, also much touched with pity for her situation, went down in the fore-cabin, where the rest of the party were, and relating the circumstances, soon raised eight shillings, one shilling of which the Little Wolf, after giving a shilling himself, put into the hand of his little infant, then supposed to be dying, that its dying hand might do one act of charity, and caused it to drop it into the doctor's hand with the rest. With the money the doctor came on deck, and advancing, offered it to the little girl, who was frightened, and ran away. Daniel went to the girl, and called her up to the doctor, assuring her there was no need of alarm, when the old doctor put the money into her hand, and said to her, through the interpreter, and in presence of all the passengers, who were gathering around, "Now go to the cruel captain and pay him the money, and never again be afraid of a man because his skin is red; but be always sure that the heart of a Red Man is as good and kind as that of a white man. And when you are in Dundee, where we are all going, if you do not find your father as you wish, and are amongst strangers, come to us, wherever we shall be, and you shall not suffer: you shall have enough to eat, and if money is necessary, you shall have more."

We intended to have laid down the pen here; but we shall venture on one more paragraph, as a better conclusion to these specimens of a very remarkable book. 'Their Bibles had increased in their various boxes since the last census to more than a hundred and fifty; their religious tracts, which they could not read, to some thousands; their dolls, in all, to fifty; and other useless toys to a great number. Then came their medals, their grossies of buttons, their beads, ribbons, brooches, fans, knives, daggers, combs, pistols, shawls, blankets, handkerchiefs, canes, umbrellas, beaver hats, caps, coats, bracelets, pins, eye-glasses, &c. &c.; and then their prints—views of countries they had seen, of churches, cathedrals, maps of London and Paris, views of bridges, of factories, of coal-pits, of catacombs, of Morgues, &c. &c. to an almost countless number, all to be opened and commented upon, and then scattered, as the first indications of civilisation, in the wilderness. These are but mere toys, however, gewgaws that will be met as matters of course, and soon used up and lost sight of. But Jim's book of the statistics of London, of Paris, and New York, will stand the Magna Charta of his nation, and around it will assemble the wisacres of the tribe, decanting on, and seeking for a solution of, the blessings of civilisation, as the passing pipe sends off its curling fumes, to future ages, over its astounding and marvellous estimates of civilised nations,

of cities, of churches, of courts of justice, and jails—of the tens of thousands of civilised people who are in it recorded (to their amazement) as blind, as deaf and dumb, and insane; of gallows and guillotines, of massacres and robberies, the number of grog-shops and breweries, of coal-pits, of tread-mills and foundling hospitals, of poorhouses and paupers, of beggars and starvation, of brothels, of prisons for debtors, of rapes, of bigamy, of taxation, of game-laws, of Christianity, of drunkenness, of national debt and repudiation.

'The estimates of all these subjects have gone to the wilderness, with what the eyes of the Indians saw of the poverty and distress of the civilised world, to be taught to the untaught, and hereafter to be arrayed, if they choose, against the teachings of civilisation and Christianity in the Indian communities: a table of the enormous numbers in the civilised world, who by their own folly or wickedness drag through lives of pain and misery, leaving their Indian critics, in the richness of their imaginations, to judge of the immense proportion of the enlightened world, who, in just retribution, must perish for their crimes and their follies: and in their ignorance, and the violence of their prejudices, to imagine what proportion of them are actually indulged in the comforts of this life, or destined to enjoy the happiness of the world to come.'

BRITAIN PROBABLY INHABITED BEFORE THE LAST CHANGES OF THE RELATIVE LEVEL OF SEA AND LAND.

In our last number, a general statement was given of the subject embraced by the work quoted below*—namely, that the last series of geological events had been, in one large district of the earth, inclusive of our island, a falling away of the sea from the land from a point many hundred feet above its present level, and this by stages which are chronicled in terraces and other markings still to be seen on the face of the land. The last shifts down to the present level were from points about 65 or 70, 56, 43, 32, 26, and 11 feet above it, some of these last being commemorated by the great low plains seen along several coasts; for example, the carse of Gowrie, Falkirk, and Stirling; the Glasgow Green, and site of the lower district of that city; the great plain on the shore of the Bristol Channel in Somersetshire, &c. We now propose to advert to a curious portion of the investigation, from which it results as a likelihood that some of the very last changes of the relative level have taken place since the island of Britain became a seat of human population.

In the first place, it may be remarked there is tolerably good proof that the last movement was a rise of the sea, seeing that on many parts of the British coast the remains of ancient forests are found extending under the waves. It appears from the work before us that there have been several such oscillations since the sea came near to its present level. For example, in the Carse of Gowrie—a low sea-side plain, chiefly composed of clayey alluvial matter—there is a bed of peat twenty or thirty feet below the surface; showing that this place had once been dry land, and the site of a forest, and that its subsidence, or a new rise of the sea, had then put it once more under water, so as to allow of the superincumbent clays being deposited. At three several points in the depth of these clays (near Polgavie)—namely, at 16½, 11½, and 7½ feet from the surface, there are vegetable roots cut off by a layer of marine shells, forming proofs of other three recurrences of the sea over the land in this place before it was finally thrown down to its present level, or rather, perhaps, to the lower point from which it has since reascended.

In the Gowrie Carse, throughout a plain generally

little more than twenty feet above the sea, there are here and there little swells, appearing as the remnants of a higher plain. They undoubtedly result from a cutting out of the intervals between them by the sea, when it stood about the level of the lower plain. Now it is somewhat remarkable that all of these swells should bear in their names the appellation of *inch* (Celtic for an island)—thus Inchyra, Megginch, Inchmichael, Inchmartin, &c.—as if a primitive people had originally recognised them as pieces of land surrounded by water. There are stories, perhaps little to be depended upon, of ancient anchors being found deep in the soil of the lower parts of the Carse, and of rings for the mooring of vessels in cliffs rising far inland. Such matters, it is admitted in the work before us, would perhaps not be deserving even of the most passing notice, if they stood entirely unsupported by facts of a more decided nature. But such is not the case.

'In 1819, in digging the Carse land at Airthrey near Stirling, where the surface is nearly twenty-five feet above high water of spring-tides in the river, which flows at a mile's distance, there were found the bones of a large whale.* No doubt can be entertained that this animal had perished here at a time when the sea stood at some unknown point upwards of twenty-five feet above its present level. About five years afterwards, the bones of another large whale were found on the estate of Blair-Drummond, seven miles further up the Carse, and probably at a greater elevation above the sea.† In this case a deep moss had covered the ground, indicating one long section of the interval of time since the death and deposition of the animal. The clay was here only four feet deep, and beneath it was another moss, the memorial, of course, of an interspace, during which dry land had existed at this spot. The bones rested on the lower moss, but did not penetrate into it. We may suppose, therefore, that it was immediately after the sea recurred here that the whale was brought to the spot. But the most valuable fact in connection with these relics is, that in each case there was found among the bones a fragment of stag's-horn, containing a perforation of an inch in diameter, evidently artificial, and in the Blair-Drummond instance, containing the remains of rotten wood. It was the opinion of Mr Home Drummond, on whose property the latter whale was found, that this horn had been the handle of a rude instrument, perhaps a harpoon, and that it had been used in some way in connection with the animal when it was stranded.' Such circumstances speak strongly of a human population in the country when the sea was fully twenty-five feet higher than at present.

There are likewise stories of remains of boats and anchors being found in the Carse lands between Falkirk and Grangemouth. At the latter place, in 1843, when excavations were making for a dock on a spot where a cottage and garden had recently been, there was found, at the depth of twenty feet from the surface, in a bed of shells and gravel, a human skull, with some other bones. This curious relic is now in the possession of Mr Hamilton, surgeon at Falkirk. Its position, it may be remarked, was below the present level of the sea, so that the only circumstances favouring the idea of its being deposited before the last shifts of the sea-level are—the change from gravel to clay above its position, and the rise of the surface to several feet above tide.

By far the most remarkable evidences towards this conclusion are found in the western side of the island. It is not yet many months since the newspapers announced the discovery of an ancient canoe deeply imbedded in the neighbourhood of the Clyde at Springfield, near Glasgow. The situation—about the level of low water in the river, between a bed of gravel and a superincumbent series of

* Ancient Sea-Margins, as Memorials of Changes in the Relative Level of Sea and Land. By Robert Chambers, Esq., F.R.S.E. Edinburgh: W. and R. Chambers. London: W. S. Orr. 1848.

* Edinburgh Magazine, August 1819. The bones 'were found at a depth of from eighteen inches to three feet from the surface, in what is termed recent alluvial earth, formed by the river Forth, and composed of a blue-coloured sludge or slock, with a covering of peat earth a few inches thick.'

† H. Home Drummond in 'Wernerian Transactions,' v. 440.

laminated clays, evidently of fluviatile origin—is considered as taking this relic out of the range of geological history, though still assigning it a very remote probable antiquity.* But other ancient boats have been found at Glasgow, which it is more difficult to regard as merely antiquarian curiosities. One of these was found in 1825, in digging a sewer at the head of the Saltmarket, a spot included within the town for centuries, fully twenty feet above high water in the river, and a quarter of a mile from it. This canoe, formed of fine oak, and exhibiting calkings of wool dipped in tar, lay in a vertical position nine feet below the surface, in a bed of blue clay, covered and surrounded by fine sand, presenting traces of lamination—that is, of being laid down in thin layers in a quiet sea. In the same deposit, at the distance of a pistol-shot, a similar boat was found in 1781, when digging for the foundations of the Tontine Hotel. Another is stated to have been discovered in Stockwell Street—a situation externally similar, but a little nearer to the river. Our author speaks of the number of these relics as remarkable, 'when we connect the remote era to which they seem to point with the modern distinction of the district as a seat of commerce; seeming to indicate that even in the earliest ages of the inhabitation of our island by man, there had been some unusual amount of intercourse by means of navigation in this region.'

We have to state, in addition to the facts presented in 'Ancient Sea-Margins,' that in 1780, when the workmen were digging a foundation for St Enoch's Church, near the place last mentioned, they found an ancient canoe at the depth of twenty-five feet from the surface. It lay horizontally, filled with sand and gravel, and within, near the prow, there was found an example of the objects called *celts*, which are believed to have been the war-hammers of the primitive people of this country. This last object survives in the possession of Mr Charles Wilson Brown of Glasgow, and is described as of a greenish stone, about five and a half inches long by two and a half broad, and perfectly polished. Across the centre it bears the mark of the fastening for the handle.

The various situations of these four boats are within half a mile of each other, on the extensive plain which skirts the right bank of the Clyde, rising to the height of about twenty-six feet above tide-mark, and forming the site of the Trongate and Argyle Street, together with the numerous cross streets connected with that line. This plain is composed of sand, as appears whenever the foundation of an old house is dug up, and the sand is deposited on laminated clays which abound in several places in marine shells. According to the work before us—'If the sand-bed at the Trongate be the same with that at Springfield, the boats lying in it and the subjacent clay obviously belong to an earlier period than that discovered in the latter situation. The question arises, Are the deposits such as the river, while pursuing in general its present level, could have laid down? The situation, be it remembered, is a quarter of a mile from the river; its superficiality is twenty-one feet above tide-mark, while Mr Robert Stevenson has determined the greatest recorded river floods as only fifteen. The laminated sands do not, moreover, appear such a deposit as a river flood would bring to the spot, even if it could reach it. It therefore appears that we scarcely have an alternative to the supposition, that when these

vessels foundered, and were deposited where in modern times they have been found, the Firth of Clyde was a sea several miles wide at Glasgow, covering the site of the lower districts of the city, and receiving the waters of the river not lower than Bothwell Bridge. We must suppose this to have been a time when already a people, instructed to some degree in the arts of life, occupied that part of the island. Taken in connection with the whales' bones and perforated deers' horns of the Carse of Stirling, the boat and other relics said to have been found near Falkirk, the human skull at Grangemouth, and the various particulars already cited with respect to the Carse of Gowrie,* these Glasgow canoes are objects of much greater interest than any one seems yet to have thought of attaching to them. Mr Smith of Jordanhill has pointed out that the Roman wall, at its terminations on the firths of Forth and Clyde, appears to have been formed with respect to the present relative level of sea and land. He also quotes the description of St Michael's Mount in Cornwall, which Diodorus Siculus gives in the time of Augustus, showing it to have been then, as now, connected with the mainland at ebb tide. Thus it appears that any change of level must have taken place before the earlier days of our historic era. If so, these relics must be assigned to an age still more remote. Perhaps it may yet appear that even the era of the Roman invasion makes but a small approach in retrogression to the period when these vessels floated with their human freight on the waters of the Clyde.'

THE FARRIER OF FRANCE.

WHY should we disdain this sombre son of industrial toil, shoemaker in ordinary to the most noble conquest that man has ever made? He belongs to the interesting family of workers in iron; and all of them—miners, founders, blacksmiths, locksmiths, *et id genus omne*, rude operatives, with black hands and copper-coloured complexions—have a claim to public esteem and gratitude, as a just indemnity for the difficulty, the discomfort, and the importance of their occupations. Furthermore, a high degree of consideration has been always bestowed upon those who minister to the comfort and wellbeing of the equine race. Whence arose the most eminent officers of the ancient kings? From the stable. Thus the Constable of France was originally the count to whom the government of the royal stables was confided—'*regalium propositus equorum, quem connestabilem vocant*,' as says the old chronicler Gregory of Tours, in his semibarbarous Latin. The *maréchal* had charge of the war-horses of the king. 'Mark-scal' signified in old Teutonic, *master of the horse*; and the learned etymologists, who settled the derivation of this word from *mark* (a boundary or frontier), and *child* (a defender), were ignorant that the monosyllable *scal* is found in other words, and has invariably the sense of master or governor, as in '*senescal*,' master of the kitchen, &c. According to an ancient memorial of the Chamber of Counts, the *maréchaux ferrants* or farriers of Bourges gave annually to the marshals of France four horse-shoes on the 1st of April, and four others on the day of the Passover. Does not this fact tend to establish a community of origin, a sort of fraternal connection, between the first dignity of the French army and the functionary we are now considering?

Hold up thy head, then, swart artisan, and let the honour attached to thy profession console thee for the labours that consume thy life. Thou art among the number of those who work incessantly for small gains. The high price of iron and of fuel, the rapid wear and tear of tools, sadly curtail thy profits. Thy toils, never-

* Mr Robert Stuart, in an elegant work entitled 'Views and Notices of Glasgow in Former Times,' gives a drawing of this canoe. He describes it as formed from a single piece of timber (oak), measuring rather more than eleven feet in length, twenty-seven inches in breadth, and, where the sides are in best preservation, about fifteen feet in depth. The forepart is almost entire; but at the opposite extremity the sides are somewhat broken down. Here there is a groove across the bottom, which leads to a supposition that this end of the tree had been cut away, and that a separate piece of wood had been fitted into the groove mentioned, so as to form a stern. The canoe is at present deposited in the storehouse of the Clyde Navigation Trustees, in Robertson Street, Glasgow.

* In Symeon's History of Galloway, written in 1684, there is an account of the finding of a ship deeply imbedded in the earth, below a water-course at the town of Stranraer. 'The boards were not joined together after the present fashion, and it had nails of copper.'—*Transactions Scot. Ant. Society*, iii. 52.
† Ed. New Philosophical Journal. Oct. 1838.

theless, are overwhelming, and ever renewed, and could not be sustained, had kind nature not endowed thee with a constitution of iron. There are professions which anybody may embrace without culture or vocation, however notoriously deficient in body or mind. A man may set up a joint-stock company or a toyshop, no matter which, without brains or sinews—but not a farrier's forge. To weld the iron upon the anvil, he must have solid muscle, lofty stature, and nervous arms. The man whose imperfect form would have disgusted a Spartan mother, cannot pretend to wield the hammer of the *maréchal ferrant*.

The aspirant to this trade commences his career as assistant journeyman, without any definite term of engagement. So soon as he has acquired some knowledge of the business, he quits his first master, and travels from town to town, working where he can find employment, at wages varying from eighteen to thirty francs a-month, besides his maintenance and free lodging, if he choose to take it, by the forge chimney. Thanks to the beneficent regulations of the trade companionship, he is sure of an asylum while waiting for employment. A journeyman farrier enters Paris; one would imagine him to be swallowed up and lost amid the immense population. No such thing. He asks the first passer-by that he meets the way to the Rue Vielle-du-Temple; arrived in front of No. 97, he beholds in the centre of the façade of the house a long huge board painted black, stuck about with gilt horse-shoes, and ornamented with the status of his patron saint. Above is written, in letters something the worse for weather—

MÈRE DES MARÉCHAUX FERRANTS.
Hôtel du Grand Saint-Eloi.

Or in humble English, 'House-of-call for Farriers; St Eloi Hotel.'

The journeyman enters; he finds his future fellow-workmen seated at table in a kind of taproom on the ground-floor; he makes himself known, and produces his credentials and attestations of service; they grant him food, lodging, and unlimited credit. The very next day, if there is any demand for his labour, he is despatched to the workshop, and assumes his occupation, without the employer to whom he is adjudicated having the right to refuse him. The workman thus learns how effectually combination gives force to the feeble, wealth to the poor, greatness to the little, and consolation to the unfortunate.*

When the journeyman has succeeded in accumulating the necessary funds, he immediately seeks to establish himself in business. His workshop is seldom more than a black and smoky shed. The forge rises in one corner, and at its side hangs the enormous bellows that excite the flame; the anvil is the table in the centre of the smoky apartment; the hammers and files lie scattered here and there upon the floor. A few years ago, near the entrance of every farrier's shed, might be seen a large wooden enclosure, or cage, called a *travail*—a prison destined for kicking horses; but it would seem that the animals have lately become more docile, or that the farriers are better able to master them, for the repressive machine is now become almost totally extinct. A decree of the Court of Cassation, of the 30th Frimaire, anno xiii. (21st December 1804), has also put an end to the encroachments which the farriers were in the habit of making upon the public way. By it they are confined to their hired tenements, and to certain courts; and the establishment of new workshops in the streets is forbidden, much to the convenience of the public, who grew tired, and complained of gratuitous kickings from restive horses.

If the farrier's shop stands by the wayside, it shines like a lighthouse at night in the eyes of the wanderer weary and footsore. The artist in search of the picturesque, the workman on circuit, the belated soldier seek-

ing to rejoin his regiment, perceive from afar the glimmering forge, and hasten with joyous step to the rendezvous. All stop at the farrier's, to hear the news and light their pipes: he knows the character of every house-of-call in the neighbourhood, and can recommend them to good fare at a moderate price, while he presents a live coal from his furnace to the bowl of the traveller's pipe.

The activity of the farrier is the bane of his immediate neighbours: at the earliest dawn they are roughly roused from sleep by his sounding strokes on the anvil; he rises thus early to rough-shape a sufficient number of shoes for the demands of the day. His labours are only interrupted at nine o'clock for breakfast, and at two in the afternoon for dinner. By an ordinance of the police, dated 26th June 1778, and implicitly confirmed by the 484th article of the penal code, all noisy hammer-wielding professions are forbidden to be exercised at any other hours than those included between five in the morning and eight in the evening; consequently, the farrier can work no later. He is not restricted, however, from shoeing a horse that casts a shoe in the prohibited hours; but he must fit, not forge the shoe, even then, under a penalty of fifty francs, imposed by the above-mentioned ordinance.

The person of the *maréchal* is broad, full-set, and somewhat imposing; the severity of his labours, and the atmosphere that he continually inhales, seem to have amplified his muscular proportions, and increased his natural vigour; and he generally enjoys a well-merited celebrity in his immediate neighbourhood for strength and manliness. The annals of the profession record that one of them came off triumphantly in a trial of strength with the celebrated Maurice, Count of Saxony. This illustrious general, while travelling incognito in Flanders during the year 1744, stopped, says the chronicle, at the door of a *maréchal ferrant*, and requested the master to show him an assortment of horse-shoes, that he might make a selection for the use of his steed. The farrier presented a number of various descriptions and qualities.

'What do you call these?' said the marshal of France: 'these were made to sell, and not to use, I reckon!' And taking them by the extremities between the forefinger and thumb, he broke several of them successively.

The farrier suffered him to proceed, in silent admiration at his astonishing vigour. When the Count of Saxony was tired of his amusement, he ordered four of a more solid construction; the artisan set himself to work, and having accomplished the operation, received a six-franc piece.

'What do you call this?' said he. 'Do you offer me base metal?' And doubling the piece between his fingers, as in a vice, broke it in two parts.

'Pest!' cried the count, 'it seems I have caught a Tartar. Let us see how long you will play that game!'

Five or six pieces met the same fate between the farrier's fingers as the first.

'I should soon ruin myself at this sport,' said Maurice, remounting his horse. 'I acknowledge myself beaten, vanquished like the Hungarians at Prague. Stop, here are a couple of louis-d'ors; drink the health of the Count of Saxony.'

These athletic performances remind us of that of a major of cavalry named Barsabas, mentioned in the miscellanea of the eighteenth century. It was his comical custom, whenever he took his horse to be shod, to watch when the farrier's back was turned, and walk off with the anvil concealed beneath his cloak.

The farriers of the present day are not a whit behind their predecessors. The sleeves of their ample gray shirts turned up as far as the elbows, display their enormous arms, of which the right, constantly exercised, is always far more muscular than the left.

When the farrier proceeds to work, he is provided with pockets of leather in double compartments, fastened round his middle by a girdle. These pockets

* To the gifts of combination may be added occasionally that of a bungling workman to an employer in need of a good one.

contain the implements of his profession:—A pair of cutting nippers, to clip off the points of any nails that project through the hoof; a punch, to drive out the old nails; a hammer; a paring instrument, generally manufactured from the blade of an old sword.

The more pretentious professors, in great towns, have substituted a mahogany box in lieu of the pockets—a palpable sacrifice of convenience to ostentation.

In the country districts of France, the *maréchal* does not confine himself to the shoeing of horses; he forges all kinds of agricultural implements—ploughshares, chains, staples, iron rings, axle-trees, &c. &c. It is the custom among the farmers to contract annually for the shoeing, at the rate of twenty francs per horse, paying his additional services of course by the piece. What would they do without their never-failing coadjutors?—how lay bare the bosom of the stubborn earth, if he were not at hand to subdue the rebellious metal to their will; to shape, to sharpen, to weld, to ply, and to toil with unceasing devotion as the faithful unwearied ally of the farmer?

The farrier, as might be supposed, pretty generally pretends to a thorough knowledge of horses, and is not slow to criticise those which are the subjects of his professional skill; and as it would hardly be good policy to balk his inquiries, he has grown habitually inquisitive, subjecting all who bring him work to a rather close questioning. 'What did you give for this colt? Is he a Normandy breed, or from Ardennes? Has he any vice? Will he go in harness? Is he well on his feet? Is he an overreacher,' &c. &c.

He has, moreover, a good opinion of his talent as veterinary surgeon, and performs operations upon cattle of all kinds with various success. The villagers believe that he cures the gripes in cows by means of prayers and invocations; but his experience has taught him a more effectual remedy. He knows when a horse wants purging with sirup of buckthorn, with calomel, with aloes, with jalap, or with sweet almonds; he detects the presence of worms in the flank by a horse's rolling, yawning, foaming, restlessness, and biting his sides. Your steed is wounded in the foot; wide fissures are visible in the hoof; the horny substance is diseased: go and consult the *maréchal ferrant*; he will prepare you an amalgam of old cart grease, deer's fat, laurel oil, populeum ointment, turpentine, and juice of onions. He can apply a seton, or use the lancet, according to circumstances, in the case of a foundered horse. He cauterises those attacked by paraplegy with two trains of gunpowder laid along the course of the vertebral spine. The most dangerous maladies—the farcy, the catarrh, the strangles, the vertigo, even the glanders, cannot resist his prescriptions; at least so he says.

The better class of farriers in France are styled *maréchaux experts*. These have been students at the college of Alfort, or at the school of Saumur, and possess for the most part a profound knowledge of their profession, together with that of the anatomical structure and maladies of the horse.

The trade of a farrier is sometimes, especially in country places, united with that of a joiner or a cartwright. These double practitioners are styled *maréchaux grossiers*, a term sufficiently indicative of their doubtful ability. They will shoe your horse well, if it please Providence; and, as might be supposed, are rarely to be found in the neighbourhood of a regular hand. As they work both in wood and iron, the law, with a careful regard to the probable contact of sparks with shavings, compels them to maintain two different workshops, separated by a wall of solid stonework of sufficient height, against which the forge must not be placed; and the position of the doors must be such that the sparks from the anvil cannot enter the adjoining room. Before one of this class can commence business, the theatre of his future operations is subjected to the scrutiny of a commissioner of police, who is empowered by law, if the required precautions have not been adopted, to order the demolition of the forge, and the

destruction of the building; to which he may add the condemnation to a penalty of four hundred francs, a sum often exceeding the entire fortune of the delinquent.

A gathering cloud already casts its shadow upon the fortunes of the farrier, and prophecies not altogether unfounded have proclaimed his coming declension and decay. 'By iron he lived, and by iron he shall die,' says the oracular voice. Who shall say that the denunciation is vain? Yet twenty years, and we may see the *maréchal ferrant*, once favoured by royal favourites, exiled to the by-places of the land, and doomed to a lingering, listless, and profitless existence among the tillers of the soil. And what will be the cause of his ruin? What but the rejection of the horse, and all existing modes of communication, and the substitution of roads made of the very material by which he now gains his bread.

The military *maréchal ferrant* is a very different personage from those above described, and has nothing to apprehend from any of the coming mutations. He is attached in the cavalry, the artillery, or the baggage-train, or other department of army service, invariably to the squadron of non-combatants—a squadron exempt from service in the field, composed entirely of workmen of various callings. Being drawn in the conscription, and having arrived at his regiment, his first care is to obtain permission to exercise his trade: if he can produce certificates of his ability, or has been a student at the colleges of Saumur or Alfort, this is readily granted. Having joined his corps, and been approved by the veterinary-in-chief, he is installed at the forge, while his wife, authorised by the colonel of the regiment, establishes a modest canteen. Behold him now in the uniform of a brigadier, bearing, as the insignia of his office, a horse-shoe on the sleeve: he is proud of his rank, and associates familiarly with the *maréchaux des logis* (quarter-masters). 'Ha! ha!' says he, 'we marshals understand one another well!'

The *maréchal ferrant* is paid by the treasurer, upon an estimate delivered by the captain-commandant, founded upon reports of certain officers and subalterns, who are commissioned to inspect his operations from time to time. The forge is under the surveillance of the captain-instructor, who looks to the proper quality and temper of the horse-shoes, and their careful and scientific attachment to the hoof of the animal; it is his duty also to see that the workshops are well provided with all the necessary materials.

When the regiment is on the march, the colonel is bound to provide for the accommodation of the farrier's stock and materials; and he commands the captains, at the head of their companies, to cause each mounted man to carry a brace of horse-shoes, with the necessary nails. On arriving at the end of their journey, each soldier is responsible for the delivery of his charge at the dépôt.

The military farrier is a soldier-workman, brave at need, but habitually gentle and peaceable. Devoid of ambition, he has not entered the army with the idea that the *baton of a marshal of France was shut up in his cartridge-box*. He is no martinet, nor devotee of military discipline, and seldom practises the use of arms. Isolated from the army, to which, however, he is so indispensable, his sole ambition is to acquire the reputation of a skilful and scientific *maréchal ferrant*.

THE FISHER'S WIDOW.

In the early part of November 184-, during one of those short but violent gales of such frequent occurrence on the north-east coast of Scotland, an event took place which is unhappily so common on our stormy shores as to create but a passing sensation, unless circumstances arise to bring it more immediately under our view. The facts were these:—

Early in the morning, a boat manned by five of the

'fisher folk' of —, a father and four sons, went two or three miles out to sea, in pursuance of their constant occupation after the close of the herring season—fishing for haddock, whiting, &c. There was a stiff breeze blowing from the north-west—but such as these hardy men have so frequently to encounter, as to be rendered often too careless of its danger—and nothing appeared to threaten a storm. However, with the sun, as is frequently the case, rose the wind; and with the wind, in a space of time incredibly short to those who have not witnessed it, rose the wild waves, rolling in with a deafening sound upon the iron-bound coast, which speedily became encircled by a belt of white surf, reaching many yards out from the shore, and amid which it was impossible for a boat to live. The fishers perceived the change in the weather, and differed in opinion as to the course they should adopt. Some were for remaining on the open sea, where, unless the storm became very severe, they were in comparative safety; but the old father and his youngest and favourite son urged their immediate return, as the season was too far advanced to permit of any certain reliance on the various prognostics, so well known to the fishers of the coast, which seemed to announce that the gale would have but a short duration. Their counsel carried the day, for all loved and respected their father; and the young George, the only one of the brothers who had a wife and children, represented that it was due to the helpless ones dependent on him to run no avoidable risk. So the boat's head was turned to land, and the furious gale urged her on wards with fearful speed. Yet to this the hardy men were well accustomed; and they guided her safely, so as to avoid the breaking waters, till they reached the entrance of the bay in which the town of — is situated, and which by this time presented an appalling spectacle indeed to those who knew their only chance of life lay through those furious and foaming waters.

Still they held on their course, and the little vessel rode gallantly; five minutes more of their swift and perilous career, and the harbour would have been gained. But it was not so to be. Rapidly they neared a dark and dangerous reef of rocks in the middle of the bay. Vainly were strength, and skill, and energy exerted to turn the little vessel from the fearful barrier ahead; the whole force of the Northern Ocean, in its wildest mood, was opposed to their efforts; a mighty wave carried them almost on to the reef; and as the bark heeled over on the returning surge, another and another swept into her: one smothered shriek—and she is gone!

Those on shore—oh with what beating hearts!—had watched the gallant but unequal struggle; and now a wild scream arose from many voices, and above all was heard the despairing cry of the young wife—so soon to be a widow—as she sank insensible on the shore. But the boat rises!—she has righted! No: she rises indeed, but keel uppermost; and where are they, so lately straining every manly sinew, and flushed with the struggle for dear life? Twice the waves carry under the devoted bark; but she rises again; and oh! this time there are living forms clinging to her keel!—and three strong men are seen supporting their helpless and insensible old father. By this time a small boat, manned by two noble-hearted fellows, who have ventured in the face of almost certain death, in the hope of rescuing their comrades, has neared them; the waves, too, seem pausing to contemplate their work of destruction. There is a momentary lull, during which the four men so wonderfully rescued are placed in the little boat by their deliverers, the old man to all appearance a corpse. But where is the fifth—the youngest born—the pride of his father's heart? Alas! in vain do the gallant fellows linger among the foaming breakers till every hope has fled, and their own imminent danger forces them from the spot. He is gone; and when the speedily-subsiding waters (for the storm did not last above four hours) permitted a search to be made for the

boat, a corpse was found, wrapped in the sail as in a winding-sheet. He had evidently made a gallant struggle for life; for a clasp-knife was found clenched in his dying grasp, and the sail was partly ripped open; but its deadly folds had encircled him too firmly, and the choking waters did the rest.

I heard a lamentable account of the despair of the poor young widow, thus deprived of the companion of her life, and the sole means of support for herself and her three infants, and I was anxious to visit her; but my trusty Jean, whom I had despatched with offers of service to the bereaved family, dissuaded me from it.

'Eh, mem,' she said, 'dinna gang, dinna gang. She kens maistly naeboddy, puir thing, and it's awfu to see her greet; and she's whiles no sensible forby, and canna thole onybody near her.'

So I waited to hear that the first violence of her despair had worn itself out, for I very much doubted my own powers of consolation; and who but One, indeed, could console in such grief as hers? However, after a time, I heard she had been partly brought to her senses by the illness of her baby, who, deprived of its natural sustenance by the blow that had shaken the very heart-strings of its poor mother, had been at the point of death. However, it was now better; and the young widow, recalled to the consciousness that there existed yet a greater depth of anguish than that in which her reason had almost forsaken her, became calmer and more composed, at least in outward appearance; and hearing this, I set out one day, about three weeks after the fatal accident, to visit her.

It was in the beginning of December; yet the weather in this fitful climate takes no heed of the ancient division of the seasons, and the day was bright and balmy as in early spring. It seems to me as if nature had assigned to these northern regions as many fine days, or nearly so, during the year, as fall to the portion of happier climates; but they are in some mysterious manner so strangely jumbled, that many a wintry day chills us in the midst of summer, while those belonging to a more genial season sometimes make their appearance unexpectedly among the blasts and frosts of autumn or winter. One of these stray children of summer was gilding and beautifying the wild country through which I had to pass, on my way to the little fishing-town of —. The level beams of a December sun threw a rich golden light over a large extent of bare but highly-cultivated country: the plough was merrily a-field among the stubble, the lark was singing high in the clear air, and the smoke ascended from many a humble hearth, and scarcely wavered in its upward course, while the scene was bounded by the blue and waveless ocean, dotted here and there with a white sail; and in the far distance, the outline of the hills of Caithness stood out sharp and defined against the cloudless sky. As I neared the sea, and caught a fuller view of the coast, the whole of the Moray Firth opened before me in a panorama scarcely to be surpassed on British shores. But I thought little of these familiar scenes as I drove on; my thoughts were bent on the errand I had undertaken; and as I slowly descended the precipitous road leading to the picturesque seaport of —, I tried to arrange in my mind a few consolatory sentences, feeling all the while how ineffectual my own happy experience would render aught I could say to soothe such sorrow as I was about to witness—for heart must speak to heart in grief; and if the corresponding chord have not been awakened in our own bosom, it is in vain we strive to calm the throb of anguish which vibrates to agony in the breast of another. So I resolved to speak only the words that should suggest themselves at the moment, and to attempt nothing more.

The little town of — is very remarkably situated; nestling, as it were, under high and beetling crags, which scarcely leave room for the cottages of the fishermen to stand, dotted here and there in picturesque con-

fusion, under the precipitous cliff. The one to which I bent my steps stood on a high bank leading up from a terrace bulwark, which had been built to resist the encroachments of the mighty waters, now slumbering, with scarce a ripple on their surface, in the broad bay before me. As I turned to ascend some steps leading to the door, I saw a gathering of many persons, and ropes, nets, fishing-boats, and gear of that description lying on the green, round which the crowd had assembled, talking earnestly, but in subdued tones. Not thinking that this had any connection with the object of my visit, I knocked at the low door, and an elderly woman, the mother of the dead man, appeared.

'Eh, mem, but it's real gude o' you to come and see us in our sorrow—come ben to the fire;' and she busied herself in placing a chair for me in the kitchen, where a peat fire, burning in an open *lum*, which allowed more than half the smoke to find its way into the room, rendered it so dark, that I had seated myself before I perceived, close to me in the 'ingle neuk,' the figure apparently of a young girl, who, loosely wrapped in a dark-blue bed-gown, with her long dark hair half concealing her face, was sitting on a low stool, and holding a little infant in her arms, over which she was murmuring a faint sound that might have been a fragment of song.

I started at finding myself unexpectedly so close to another person, and the girl fixed a pair of large dark eyes steadfastly upon me for a moment, and then dropping her head again on her bosom, resumed her low chant. I turned to the woman who was standing near me, and said, 'I called to see poor Jessie—how is she?'

'Deed an' it's a sair day wi' her the day. No but a' days are sair and heavy noo; but ye see they're roupin' puir Geordie's bits o' nets an' siclike, an' it aye brings back the sorrow upon her.'

'Can I see her?' I said.

'Surely, mem, surely. *She's there out-by!*'

An indescribable feeling came over me as I turned to the poor creature, and again met her steadfast gaze. I tried to speak, but a choking sensation in my throat told me the attempt would be vain; and for a moment nothing was heard in the cottage but that low *crooning* sound—the wail of a broken heart.

'She's quite quiet noo, mem, an' sensible,' said the mother, who I fancied attributed my emotion to fear of the poor creature. 'She hasna grat any sin' the bairnie took ill: but she's a hantle better noo;' and then I saw that the poor baby was attempting to find the nourishment of which its mother's agony had deprived it.

'She is a healthy-looking little baby,' I said, feeling I must say *something*; and taking the tiny hand in mine, 'How old is she?'

'Ten weeks mem. She was seven weeks the day her father went.'

Another glance from those dark eyes; but no sound except the low moaning song.

'It is a heavy trial indeed,' I said, speaking more to my own thoughts than to those near me. 'A heavy and bitter trial; but she will have her children to look to, and she will not want for friends;' and I felt at the moment as if I could almost have gone down to the deep myself to have given back to that poor creature the one light of her lowly life.

'No, mem, that winna she: she winna want while puir Geordie's auld father an' mither hae a pickle meal to gie her. But trouble's sair for the likes o' her, but twenty-one years of age—it's sair e'en upon me, the mither o' him: but I hae been a fisher's daughter, an' sister, an' wife, an' mither; an' in fifty-three years I hae lost father, an' brithers, an' friends by the sea—an' noo my bairn, my youngest'—and here two tears rolled down her brown and wrinkled cheeks, but she heeded them not, and continued—'An' I'm used to the trouble; but it maun be sair upon her at the first.'

No look this time—no sign that she took the slightest interest in words which, in their touching simplicity,

called forth irrepressible tears from me—only that ceaseless song.

'Sore, indeed,' I said at last. 'But He who afflicts will comfort in His own good time.'

'Ay will He, mem; an' He does; an' I hae proved it to my comfort, an' I hope to my saul's guid,' said the old woman reverently. 'An' he has blessed us even in this, in giving us our puir Geordie's corp. We hae laid him in the kirkyard, by our ain folk, an' that's muckle to think o'; for it's sair when ye canna think o' them that's gane as at rest; and when the broad sea itsel' seems a' like a grave.'

What could I say to this? Would it not have been vain indeed to offer consolation to one who knew so well where to find it for herself; and in the depths of her own earnest and pious spirit, had found words, so poetical in their unaffected simplicity, with which to express her feelings? So in the hope of at length rousing the poor stricken creature beside me, I asked for the other children.

'The lassie's awa' at her aunt's, mem, but Geordie's near by the house: puir wee Geordie, he's gotten the name o' his father!'

The old woman went to the door, and returned with a tiny, curly-headed child—the eldest of the three—who was crying silently; but evidently from some deep feeling.

'What is't, Geordie, my wee man?' said the grandmother—for the mother never even raised her eyes.

A burst of sobbing was the only reply for some minutes; and at last one by one struggled out the words—'Muckle Willie's awa'—wi' daddie's claes—an' he says—they're no daddie's noo—an' he's gaun to keep 'em!'

I could not stand this; so hurriedly thrusting the trifle I had brought for the relief of the poor creatures into the cold hand that hung passively near me with a murmured 'God bless and comfort you all'—for I could not trust myself to speak—I found myself in the fresh air, and tears came to my relief.

Oh blessed be His name who has promised to be a husband to the widow and a father to the fatherless! Were it not for this hope, how could the heart even *know* of such misery, and not break?

THE DEAN OF DURHAM ON GENERAL POLITICS.

[From his Address at the Opening of the New Building for the Gateshead Mechanics' Institute, April 10, 1848.]

I confess it has often occurred to me that the principles of general politics—which term I use as opposed to the term party politics, and by which I mean those acknowledged principles on which are founded our political rights and our political duties—our proper offices as citizens, as members of the same social community—I have often thought, I say, that these principles ought to fill a more conspicuous place than they do fill in the education of all classes of the people. Indeed I do not remember ever to have seen any elementary work so composed as to display a compendious view of those principles; to show, for instance, how a graduated subordination is essential to the existence of every form of society—and how any theory of universal equality in wealth and condition is at variance not only with reason and experience, but also with nature; which has distinctly laid down the opposite law, and made all men in almost all respects unequal—to show that inalienable duties are imposed upon all classes, high as well as low, by the same social organisation which protects their property and their rights—to point out the mutual relations by which the several classes depend upon each other for their mutual welfare—to make it clear how any evil which may befall any one of these will sooner or later be largely shared by the others—and how national greatness, and public and private happiness, depend upon the co-operation and concord of all. Now I think, my friends, that if these principles, which no rational man disputes, and which are in fact at the bottom of all that we call politics, were generally inculcated as a part of education, we should reap the fruits in some increase of that beneficent use and application of property on the one side, and of that orderly

intelligence, that enlightened and well-founded contentment on the other, which form together the surest guarantee for domestic peace. This sort of knowledge, if it shall confer power, will confer at the same time discretion in the use of power—it will show the proper objects of power, the proper limits within which power may be exercised. It will teach men their rights, social and political; but it will teach them their duties also—for every right involves a duty, or rather a number of duties—and men are generally much more ready to claim the one than they are to perform the other. Indeed, my friends, if I were to apply this remark to that description of political right most familiar to you—the right of the franchise—how many are those in this kingdom who exercise the right and neglect the duty; or, I should rather say, never so much as consider or feel that there is a duty—a serious and sacred duty—which, like all other duties, ought to be honestly, faithfully, and fearlessly discharged.

RENOVATION OF OLD APPLE-TREES.

The following information, received from a gardener who for many years largely supplied the London market with fruit, may probably be new to many of our readers:—It is generally found that after an apple-tree has borne for a certain number of years, it becomes comparatively unproductive. It has been usual in such cases to remove the old tree, and replace it by a younger one. This may be obviated by re-grafting the old tree; and according to the testimony of the gardener above-mentioned, the older the stock, the better is the quality of the fruit. He had scarcely a tree of any age, among several hundreds that his orchard contained, when the writer visited it, that had not undergone this process, and in some cases more than once. There were trees whose trunks were so hollow as in some parts to be little more than a shell, which had been subjected to this operation the season before, and, judging from the vigorous appearance of the grafts, with perfect success. The plan he adopted was the following:—The ends of the branches were sawn or cut off where they were about the size of a man's wrist, or rather less, and two or more scions inserted in each, according to circumstances. By this means, in the course of three years he obtained a large full-bearing tree. The principal difficulty was to protect the new grafts from damage in high winds. This was overcome by ingrafting the half of the tree at one time, and leaving the other to form a shelter; and completing the other half when the grafts were sufficiently grown to return the shelter. It is scarcely necessary to add, that this precaution did not supersede the usual appliances for giving the scions support, by means of poles attached to the branches. It may also be remarked, that the productive powers of apple-trees are frequently impaired by the want of sufficient attention in gathering the fruit. The greatest care should be observed in removing the apple, that the bearing spur be not broken or injured thereby.

THE BABY-JUMPER.

The endless restlessness of healthy children inflicts on those attending them a constant watchfulness. Anything which relieves a poor mother or nurse of this anxious attendance, even for a few minutes, is felt as a blessing. A mechanical means of such temporary relief has just been invented in America, and introduced into England. The 'Baby-Jumper,' as the machine is called, consists essentially of a strap seat for the child, suspended to four cords, which are kept asunder by passing over a horizontally-disposed hoop; this again being capable of being hung from a ceiling by a strong India-rubber strap, highly elastic. The baby, placed in the seat, and suspended with his toes just touching the floor, can, by a very slight movement and exercise of muscular force, cause himself to

rise several inches into the air, whence of course he descends immediately to the floor once more; and thus he may dance and caper for a quarter of an hour, to his own great delight, and the improvement of his bodily powers. The contrivance seems to give to a mere baby, say of eighteen months, all the gratification which children of five or six years derive from a swing. We have seen a minute miss enjoy the exercise so much, as to be for the time in no need of attention from the nurse: she literally danced herself into a state of fatigue, and fell into a profound sleep, with her hands on the cords, and her head reclined on her shoulder. If the article could be produced cheaply for the poorer class of people, it would be of infinite advantage to them, as a ready resource for taking the baby off the mother's hands while she had other duties to attend to.

LINES WRITTEN IN MEMORY OF A FAVOURITE BIRD.

I TAUGHT my gay and beauteous bird some words of love to prize,
And fancied meaning beamed within his dark and lustrous eyes;
I taught him fond and winning ways he never knew before—
Ah! how the sweet one fluttering gained his rare and dainty lore.

That bird was strangely dear to me; and when I mused alone,
His thrilling cadence seemed to mourn some loved and absent one;
But at the holy sunset hour he nestled in my breast,
And understood of all sweet birds I loved my own the best!

In solitude and loneliness the human heart must cling
And rest on something—though it be a dumb and soulless thing.
When summer roses fade away, 'tis sad to see them die,
But far more sad it was to hear my gentle bird's last sigh.

And all beneath a white rose-tree I laid his little head—
The tree he loved to nestle on now shades his grassy bed;
And when at eve these buds are gemmed with dew-drops soft and cool,
Amid them falls a tear for thee, my bright, my beautiful!

C. A. M. W.

THE PACKET SHIP.

The packet ship is a curious triumph of modern times. We are domiciliated upon the ocean. I hear the notes of a piano, the lowing of a cow, the cackle of hens, indeed all the noises of a barn-yard! We have fresh meat and milk, warm bread, &c. Sea travelling, however, is capable of being yet more improved upon. Warm baths might be introduced, and stoves to destroy the effluvia of bilgewater. Cabins might be so constructed as to admit the air through a small side window to each. The berths, sofas, and dinner tables, with their seats, might be hammock-swung.—*Fay.*

DANGER OF WEEPING.

However poetical tears may be in themselves, the act of weeping is undoubtedly attended with a certain risk. We have known beautiful women who looked at least plain when they cried; and we never knew plain women who did not look—if we may venture upon a profane expression—downright ugly. The reason must be, that the act of weeping distorts the features, just like the act of laughing, while it is unredeemed by the agreeable associations of the latter.

The present number of the Journal completes the ninth volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.

SUMMER-TIME IN TOWN AND COUNTRY.

BY THOMAS MILLER.

LONDON in summer-time is like one of those great kitchens which were fitted up somewhere within the castles that were inhabited by the Ogres of our olden tales, and in which poor humanity, when captured, was cooked. If you stand upon the gratings to look into the shop windows on the sunny side of the way, they are as hot as gridirons, and if you loiter long enough you would be broiled. You get outside an omnibus to enjoy the fresh air; but all the fresh air has rushed down the streets that open upon the river to cool itself—and there you are all but baked. You get down, and try the inside by way of change; but that is like a great arched boiler, whose only safety-valve is the half-open door, and you find the big drops oozing from your forehead, and have just time to hail the conductor, to save yourself from being tenderly steamed. If you get into one of the squares, you might almost as well be fixed on a roasting-jack, for every window looks like a fire; and you go round and round, like Falstaff, 'larding the lean earth.' You hurry off to Pockfiriars Bridge, hoping there to find a little breathing space; but every 'villanous compound of smell' has stolen a march before you, and is out sweetening itself. You try London Bridge, from whence so many of her Majesty's lieges embark, and there you are greeted with the self-same evil scent, as if 'Death could not keep his court' anywhere beside the Thames but at the foot of the bridges. Like a rat that tries to climb up the side of a copper covered with verdigris when a fire is lighted below, so to avoid the heat, you rush recklessly amid the poison, slip down, resign yourself to the Fates, and are either baked, steamed, or boiled, as they will it. The very dogs lie on the hot pavement as if they had given up all hopes of ever again finding a cool place; and as they languidly raise their eyes while you pass, seem to say, 'I would pity you if I could, but there is no help for either of us.' The cab-horses hang their heads, and stand motionless; they have even given up whisking their tails and ears, but allow the flies to bite and the sun to burn, as if appealing mutely to our sympathies; while their very looks seem to ask if any one has the heart to call them off the stand on such a day. The brasses at the front of the windows blaze again; and 'Snip, Tailor,' seems written on a tongue of flame. The only chance you have of cooling yourself is by trusting to the imagination, and looking into the shops where Wenham ice is sold, and fancying that you can see it freezing. Even while the soda-water is effervescing, everything around is so hot, that you are almost doubtful whether or not it boils, so drink it up with a kind of desperate risk. The milkman's cans have a fiery look, and you marvel not that the milk so soon turns sour, while carried about in such-like furnaces.

You shut one eye as you walk along, for it is the only part you can preserve from the heat. You feel almost sorry as you peep in at the fishmonger's, to think that the finny tribe should be taken out of their native element in such weather, and laid there to bake. A footman in scarlet livery looks like a burning sacrifice offered up by pride, as if he suffered for the sins of the whole family he serves. The flowers in windows droop, and seem sorrowful, and we never see a butterfly that has missed its way in the streets hovering around them without thinking that it is endeavouring to entice them away to the pleasant gardens in the suburbs: it seems a lost messenger sent out by the flowers. A green watering-pan at a brazier's door awakens pleasant recollections, and a parcel of children puddling about a pump or a plughole makes one feel cool for an hour after. On a breathless sultry day, the shrubs in the close city squares look as if they were cut out of green tinfoil; while the crevices between the stones over which the watering-carts pass seem to open like the mouths of a parched and thirsty multitude, each eager to catch the coveted drops. You envy the man who can smoke on such a day, and almost fancy that he must have some little portable fountain in his inside with which he cools himself. Covent Garden Market would really be pleasant, if you could but be sheltered by the shadows of covering trees, instead of the heated roofs of the stifling colonnades. Holborn and Snow Hill appear as if made purposely to punish stout sinners and vicious horses. Gold-fishes in a glass globe that stands in the shade are the only living objects you look upon with feelings of envy.

But leaving all discontent behind, let us look at summer through her green and ever-open doors into a little world walled with hedges of hawthorn, which but a month or so ago were white over with May. That fragrance—rich as ever floated around Eve when she knelt to pray in the garden of Eden, while her long hair fell upon clusters of full-blown roses—has been borne along by the breeze from some neighbouring hay-field. How refreshing it feels after inhaling that burnt-brown-paper smell which pervades the city streets! How gracefully that woodbine twines around the hazel! You can already see the young nuts peeping with their green bunches between the coronets of the red-streaked flowers. The very cooing of the ringdove falls drowsily upon the quietude, now near, now afar off, just as the fitful breeze comes and goes, and makes a murmur amid the long leaves. The water-flies seem playing with one another as they are swayed by the gentle wind; and the dragon-fly, that sits upon the edge of the white water-lily, looks as if admiring the fine gauze of his wings, and the beautiful blue of his slender body, which are mirrored in the clear stream. What a home of rest appears that thatched cottage, nestled amid the flicker-

ing shadows of the trees! How the roof, covered with lichens, harmonises with the hue of the stems and the shifting tints of the foliage, which here throws down a moss of the deepest green, and there lets in the sunlight in a flood of floating gold. Even the windows, as they glitter through the openings of the branches, suggest pleasant thoughts; and you think that a sacrifice of many needless luxuries would be cheerfully counter-balanced by the beauty and tranquillity which reign around that rural dwelling-place. Such sweet retirements are assuredly calculated to awaken holier thoughts than the buzzing tumult which breaks the air above crowded cities. Here we seem to stand nearer witnesses of the works of God: there, whichever way we turn, we are reminded of man; his scaffoldings, his piles of bricks, timber sawn, iron beaten—all proclaim the slow progress of labour. Here the flowers spring up, and the leaves shoot forth, and the young branches grow longer every day; but there is no sign of toll, no hand to fashion, no model to work after. The great frame in which the warp and woof of leaves and flowers are woven was touched by an Omnipotent finger in the beginning; and neither day nor night, winter or summer, hath it stood still wholly, or needed human aid. Upon the summits of those hills the sun plants his golden feet amid the trembling dews of the morning, and the moon at night steps down uninterrupted amid the purple twilight: there are no fogged roofs over which to trail the floating silver of her drapery here—nothing but the daisies below and the stars above, and the perfume arising from miles of country flowers around her. How grand and solemn is the avenue that runs along the centre of this old wood, equalled by nothing excepting the vaulted roof of some hoary cathedral! Man needs not a more fitting temple to worship his Maker in than this. Look how those aged stems rise like mighty pillars, and support the airy dome, which looks as if enriched with the most beautiful fret-work: you might fancy that the breeze, which makes a low moan at intervals, was the dying tone of an organ; and the songs of the birds the voices of the veiled nuns, who are chanting somewhere in the hidden aisles of the trees. The rich sunlight that streams through the branches in the distance looks like a deep-dyed window, in which fancy pictures the forms of bearded saints and white-winged angels, and rounded halos of glory, such as encircle the brow of Mary Mother and her God-child. Where yonder white cloud comes in like softened moonlight between the embowered boughs, lighting here and there the pale stems of the birches, imagination sees the silver lamps shimmering before the shrines, and in the blue haze that settles down over the deep sunken dells, traces the faint smoke of the waving incense. The very brawling of the stream sounds like subdued voices in 'dim oratories,' and where it runs here in light and there in shade, looks like far-off processions seen for a moment, then lost again in the gloom of low-pillared arches.

It seems a spot where man might sit and weep
His petty griefs and childish cares away;
Wearied Ambition might lie here and sleep,
And hoary Crime in silence kneel to pray.
The low-voiced brook, the daylight dimly given,
Seem like that starlight land we see in dreams of heaven.

Our early poets painted summer as a beautiful woman in the full bloom of life, whose snowy forehead was wreathed with blown roses, which began to die as soon as they reached perfection. They spared her a lingering death, and cut her down like a flower in the night, as if summer could never be old. To autumn they gave the rumbling wain and wheat-sheaf, and for years bowed her down with the weight of ripened fruit.

All animate nature seems now to be keeping holiday; the very water-rat plays over its food, now nibbling at the leaf that is swayed to and fro by the ever-moving ripples, then swimming lazily round it, or making a momentary effort to breast the current, that it may again be borne along it idly. The black water-hen, followed by her dusky and downy brood, as she paddles along in the shadow of the overhanging willows, seems as if she was taking them out for a day's pleasure, instead of leading them onward in search of insects. The lambs, which have now grown tall and strong, appear to have little more to do than run races with one another, or bleat to their woolly dams to look on while they are displaying their agility. In the air, myriads of insects are congregated in the merry dance, some high up beyond the tallest trees, as if the broad unbounded realm of space alone was roomy enough for so immense an assemblage to 'tread a measure.' But let us try how the picture will look in verse:—

A cottage girl trips by with sidelong look,
Steadying the little basket on her head;
And where a plank bridges the narrow brook,
She stops to see her image shadowed.
The stream reflects her cloak of glaring red;
Below she sees the trees and deep blue sky;
The flowers which downward look in that clear bed,
The very birds which o'er its ripples fly:
She parts her loose-blown hair, and wondering, passes by.

Then other forms move o'er the pathways brown
In twos and threes, for it is market-day;
Beyond those hills stretches a little town,
And thitherward the rustics bend their way,
Crossing the scene in red, and blue, and gray;
Now by green hedgerows, now by oak-trees old,
As they by stile or low-thatched cottage stray;
Peep through the rounded hand, and you behold
Such scenes as Morland drew in frames of sunny gold.

A laden ass, a maid with wicker man,*
A shepherd lad driving his lambs to sell,
A butcher-boy seen through the park-like lawn,
Women whose cloaks become the landscape well,
Farmers whose thoughts on crops and prizes dwell;
An old man with his cow and calf draws near;
Anon you hear the village carrier's bell,
Then does his gray old tilted-cart appear,
Moving so slow, you think he never can get there.

They come from still green nooks, woods old and hoary,
The silent work of many a summer night,
Ere those tall trees attained their giant glory,
Or their dark tops did tower that cloudy height.
They come from spots which the sweet May-buds light,
Where stream-washed willows make a silvery shiver;
For years their steps have worn those footpaths bright
That wind around the fields, and by the river,
With its low murmuring sound, that rolls and sings for ever.

Nor are the sounds which give a voice to the landscape less pleasing than the moving figures which fill it with the stir of life, and are so essential to picturesque beauty. The very rattle of the bird-boy's clapper, and the shrill tones of his child-like voice, as he scares the birds from the ripening corn, are in harmony with the great concert of rural sounds. It prevents you not from hearing the jingle of the harness, and the grinding of the broad wheel of the wagon, that is descending the adjoining hill; even the clap of the distant gate falls upon the ear sharp, clear, and audible, as if struck at the true moment of time. The 'rasp, rasp' of the mower as he sharpens his scythe, drowns not the bleating of the sheep beside the brook, where they are assembled ready for the washing; the song of the milkmaid, whose pail you can just see balanced above the hedge of wild roses, seems answered by the choir of linnets that are singing among the gullies

gorse bushes, whose armed stems are hung with thousands of little golden baskets; the 'click, click' of the stone-breaker's hammer from the roadside rings like a heavy symbol; and the deep lowing of the brindled bull, as it comes across the river from the green marshes, sounds like the loud bass, which folds together every floating sound in the grand anthem.

How different to the rattle and the roll of the lumbering omnibuses, and the groaning drays, which jar the very foundations of our city streets—bursts of unceasing thunder, almost loud enough to break the dull drum of a deaf man's ear! Who would not, at such a season, sit with his crust of bread and cheese, and jug of home-brewed ale, under the porch of a roadside inn, with a landscape stretching before him filled with such sights and sounds as we have pictured, rather than fare sumptuously in a city dining-room, black with the 'steam of twice ten thousand dinners!' Fancy hot chops, and great smoking potatoes—a dim skylight overhead, and a cook within a few yards of you—a huge fire, and a gridiron that 'grins horribly' above the ruddy embers—and if you can recall any other images than those connected with martyrdom, or dim glimpses of the fire office which a wicked old gentleman is said to have the management of below, you are gifted with a power of imagination such as hath not visited your humble servant. Fancy summer spent in London in apartments adjoining a baker's oven, in a street up which only one vehicle can pass at a time; where the pavement is so narrow, that a stout man has either to walk sideways, or stand up under a doorway while a cab passes; where the sunshine gilds nothing lower than the attic window, and that only for a few minutes during the day; then turn the mind's eye to 'green nestling spots for poets made.' In places like those, you have a pleasant prospect of your opposite neighbour washing, drying, and ironing, all in the space of an hour or two, and in the same little room. You see Wiggins put his three potatoes into the little saucepan, and watch the progress of the small portion of steak he places upon the fire; then witness him enjoying the fresh air as he blows his face with the bellows, or revels in a bath holding a quart of Thames water. You fairly pity the poor boy who has to carry half a hundredweight of coals up so many flights of stairs, and think the old lady acts wisely who gets her kettle boiled a dozen doors off up the street, and brings it home steaming in her hand. The tripe shop on the ground-floor seems to be visited by no other customers than Bluebottles, who walk in and out, and help themselves without paying. The butter in the chandler's window dissolves while you look at it, the bladder of lard has a lanky and melting look, while the bacon is manufacturing itself into a state of streakings by throwing out quantities of superabundant fat—for a slow cooking process is carried on everywhere.

No marvel that the Cockneys rush with a kind of desperate determination to Gravesend, Herne Bay, Margate, Ramsgate, or any other of their favourite watering-places, and eat shrimps and lobsters, and take baths, with a perseverance that appears the very opposite of their general natures, as if they endeavoured every way to familiarise themselves to a new element, and were by degrees preparing to become inhabitants of the great deep. Davies the drysalter emerges from his dark-looking house in Upper Thames Street, and mounting his yellow slippers and telescope, sweeps the rounded horizon, and grows eloquent in 'reefing,' 'steering,' and 'boxing the compass,' even permitting the ends of his neckerchief to fly out loosely, and blend with Mrs Davies's green veil, because it gives him a kind of sea-going rakish-built look. He thinks it would have been a great improvement to have built all large towns by the sea-side—the houses would then have looked so pleasant in summer. His spouse reminds him that there is no walking on the sands, or going out in sailing-boats in winter. To this he acquiesces, and agrees that London is not so badly situated after all.

The railways are working wonders, by carrying out their thousands from London in summer to sweet breathing-places a few miles out, which only six or seven years ago

it would have been half a day's journey to have reached; while now we can be set down in a world of leaves and flowers within the space of an hour. Pent in a populous city as we are, we have assuredly less cause to murmur than our forefathers, when, by paying ninepence, we can reach Sydenham, or Croydon, in little more than half an hour; and instead of getting charred in Cheapside or Cornhill, plant our feet where the bluebells blow and the skylark builds; or even stand where

The leaves 'drop, drop,' and dot the crisped stream,
So quick each circle wears the first away;
Where the tall bulrush stands, and seems to dream,
Or to the ripple nods its head alway.

THE SUGAR QUESTION.

JUDGING from the experience of the last few years, it may be doubted whether an unreflecting and sentimental humanity is not more harmful than the individual and social miseries which it is professedly designed to alleviate. The best feelings, unregulated by judgment and knowledge, may lead to consequences the most disastrous. Compassion for the poor is a noble and proper feeling; but how mischievous when assuming the form of indiscriminate almsgiving, in which it breaks down the principle of self-reliance, checks industrial enterprise, and produces systematic mendicancy. Commiseration for bodies of workmen temporarily without employment is an equally commendable feeling; but how shortsighted that policy which, on the plea of finding work for these unfortunate operatives, proposes to exclude certain foreign manufactures from the country. Pity for a large class of young females in the metropolis, who undertake to make shirts at three-halfpence each, is not less a Christian sentiment; but how absurd to decry the employers of these females, when the whole cause of the evil is the too great supply of labour—the excessive competition of hands in proportion to the work to be executed; and how much more reasonable it would be in this, as in other instances of hardship, to relieve the labour market by emigration or otherwise, than to raise fresh competition by a public subscription of funds. In this way it could be shown that in very many things affecting general interests, zeal without discretion may be most unjust and dangerous in its dealings.

By far the grandest instance of this well-meaning but questionable policy was the abolition of slavery in our West Indian possessions. The measure itself was only consistent with principles of justice and humanity: it rid the British dominions of a disgraceful stigma; it liberated thousands of beings from compulsory bondage. All that is allowed; but was this great national act not tainted with the vice of imprudence, and have its more special promoters not been chargeable to a great degree with defeating by their zeal the ends which they and all others had professedly in view? It is of no use shirking the matter: the confession must be made. The abolition of West Indian slavery, while communicating freedom to a British population, has vastly increased the horrors of slavery in foreign tropical climes. Such a result never could have been contemplated by Clarkson and Wilberforce. The Anti-slavery Societies could not have anticipated that their doings were to have the effect of increasing the amount of slavery generally, and likewise of rendering the transmission of slaves from Africa more cruel and iniquitous than ever. Yet all this has happened. The public press is full of details respecting the extent and horrors of this post-abolition slavery; and we need not therefore go minutely into the subject. It is sufficient to know that all our expensive and ill-conceived plans for preventing the deportation of slaves to Brazil, Cuba, and other countries have failed; that we are now paying a

million and a-half of money annually to suppress the traffic; that this sum is worse than thrown away, for the slave-trade goes on vigorously notwithstanding, and with greatly increased cruelties; that slave-holding states rejoice in our act of abolition, as it gives them a partial monopoly in growing, by means of slave-labour, the sugar and coffee which we, the people of Great Britain, require.

As a means of redress for their alleged grievances, the West Indians earnestly request that the imperial legislature shall impose such high duties on the produce of Brazil, Cuba, &c. coming into the home-market, as will give them, the West Indians, a command of our trade. Such duties formerly existed, but by an act in 1846 they were much modified; and now, only for a brief period, is there a small discriminating duty. A return to high protective duties is strongly advocated by some parties unfavourable to free trade; but it is almost unnecessary to say that the realisation of any expectations on the subject is altogether hopeless. The people of England have now had an experience in buying cheap, and they will never willingly go back to buying dear sugar in preference. Sophistries may be employed to show that protection is a good thing, and not a few happen to be deceived by them; but the most illiterate housewife cannot be reasoned out of the evidence of her senses. The most adroit advocate of protection could not persuade her to pay sixpence for a pound of sugar which she was offered by somebody else for fourpence. The propriety of buying sugar, like bread, wherever it can be had cheapest, is now the received doctrine. It may be a vulgar mercenary doctrine, which is very much to be lamented, but sentiment cannot be infused into the buying of sugar. Pity is unknown in the negotiations of the counter. To speak plainly, we are too completely tired, worn out, and impoverished, in taxing ourselves, to think of making sacrifices for any class, colony, or nation. The West Indians may have expected something very different a few years ago, when they embarked their fortunes in sugar-growing property. All very likely; but it cannot be helped. We are in a shifting world; and it is the temper of the times to overlook the conditions of national intercourse. In short, if the West Indians ever expected that, till the end of time, the people of Great Britain were to give them two pence or three pence a pound more for sugar than they could buy it for elsewhere, or, in other words, tax themselves to the extent of £3,000,000, for the loss would be to that amount, they were in an unfortunate mistake—that is all.

According to the representations of those who seem interested in maintaining differential duties, the saving now effected in the purchase of slave-grown sugar cannot possibly continue; for as soon as, by our proper preference of a cheap to a dear article, we have altogether driven the West Indians from the field, the Cubans and Brazilians will possess no complete a monopoly, that the price of sugar will be raised; thus we are now pursuing a most shortsighted policy. This argument has been extensively used at public meetings, and also by a portion of the press; though we should hope without gaining many proselytes. Sugar is not an article of which there can be only a limited produce; and the supply, with some contingent and brief interruptions, may always be expected to be equal to the demand; while the competition in furnishing the supply will in all probability keep the price moderate. It is not to be denied, however, that just in proportion as we throw the trade into the hands of planters, remorseless as to their means of enforcing production, negro slavery will go on increasing in intensity. The Cubans and Brazilians appear to be looking forward to a period when fresh hands must be imported, fresh grounds broken up, and fresh capital employed. Never was the commerce in slaves more brisk, never was the lash plied so fiercely, as at the present moment; and yet a trade greater by far is anticipated. The expectation is founded on a knowledge of the fact to which notice has already been drawn—that a philanthropic zeal without discretion still guides the destinies of the West Indian colonies.

We should like to disappoint the hopes of these

ruffians. Let the market by all means remain open to importations of sugar, no matter whence it comes; and for the sake of economy and humanity, let us withdraw our costly preventive service from the African coast. If the Cubans and Brazilians will have slaves, in spite of us, let us be so far responsible as to permit them to carry off the unfortunate captives in a manner not revolting to decency. Having thus far returned to common sense, we should desire to go one or two steps further, supposing the West Indians to stand in need of such supplies of free labourers as would enable them not only to compete with slaveholders, but show to the world, that the work of freemen is cheaper than the work of slaves; that it is better to hire than to buy men—let us place no obstruction in their way. What a glorious thing to demonstrate the truth of the doctrine in social economics, that hired is cheaper than purchased labour! and to venture to say that till this be demonstrated by evidence, practical and undeniable—undeniable, because felt in the pocket—the odious traffic in slaves will not be abandoned, neither can it be put down. Some years ago, sanguine hopes were entertained that merely by employing the emancipated negroes in the British settlements, the greater economy of hired labour would have been realised. The circumstances which have prevented the realisation of these dreams need not be reviewed; whether employed or employed have been to blame, is now of little consequence. What concerns the present question is, the complaints by the planters that they cannot procure sufficiency of labourers at fair wages. We are not without a suspicion that the complaints are for the most part groundless; but unfortunately the mother country is not in a position to disregard them. We avowedly, our laws, prevent the West Indians from seeking for the assistance of fresh hands: they are not allowed to import and hire negro labourers from Africa on a scale suited to their alleged necessities. Inspired by the terror of originating a new slavery in disguise, negro immigration is said to have been checked, and a dearth of labour created. It is not to the credit of English sagacity that what is at the utmost a matter of detail in arrangement should bring a rational principle to a dead halt. We have no right to prevent our West Indian fellow-subjects from hiring Africans if they choose to do so; all we need to look to is, that the practice shall not be abused. Doubt the ignorant and hapless natives of the African continent might too easily be seduced into bondage, the plea of being used only as hired labourers for a limited term; but it is preposterous to say that the legislature could not enjoin such precautionary arrangements, both at the ports of embarkation, and within the colonies respectively, as would effectually shelter the personal liberty of the employed. We are at least satisfied that a well-derived plan of immigration should be tried, of course at the expense of the colonies, and with their approval. The direct benefit to be derived from the experiment might possibly turn out to be illusory, but an important object would be gained in throwing the entire cause of failure on those who are now concerned crying out ruin from a dearth of labour. Were the experiment successful, how greatly should we have advanced in working out the problem of creating a wholesome intercourse with Africa.

We are sorry to say that, from all credible evidence public and private, the present occupants of property in the West Indies are not generally the class of persons who may be deemed capable of grappling with the circumstances into which the islands have been thrown. Alluding to the evidence on the subject of the duties lately laid before parliament, and from which select committee inferred that the colonies were ruined in consequence of the withdrawal of protection, in a provincial print (the 'Manchester Guardian') set up as follows:—'We have carefully examined the evidence, and we find none (if we exclude opinion expressed apart from facts stated) which can be considered as proving that assertion.' We find, it is true, abundant evidences of ruin; but in almost every case appears to have been completed before the sugar act

1846, and from causes long antecedent to that measure. We find the strongest evidence, given by the West Indians themselves, of the prejudicial effects of mismanagement; of the consequences of encumbered estates; of the enormous charges imposed upon them by being mortgaged to British merchants, who, on their own terms, conduct their sales and purchases; who provide shipping at their own established rates of freight, irrespective of the common market rate; and of high rates of interest and commissions paid for loans. We find, too, evidence enough of the mischievous consequences of absenteeism; of the mismanagement of agents, to whom estates are intrusted; and of the enormous savings effected by those who have had the courage and the energy to pay even occasional visits to their estates. We find much evidence of the evil consequences of a want of capital; of the entire absence of suitable implements of husbandry; and of the great saving which has been effected where they have been introduced. All these, and many other facts, we find spoken to in the evidence; evils sufficient to have ruined the West Indies over and over again, whether they had been protected up to strict monopoly, or exposed to perfectly free trade. But although these facts abound in every page, less or more, strange as it may seem, not the slightest trace of them is to be found in the resolutions of the committee. There, all the blame is inferred 'to rest upon free-trade, and protection is pointed to as the only cure. The sugar act of 1846 is the bane, and a high differential duty is the antidote.'

The following extract from a private letter written by a resident planter in British Guiana appeared a few days ago in the 'Morning Chronicle,' and is corroborative of the above. 'If the planters would live on their own estates, feed on their own stock, and place their managers in their proper rank, they might keep their estates. It is more absenteeism than the equalisation of the sugar duties which impoverishes the landowners. While the proprietor lives in Europe, the manager occupies the mansion; his wife gets an establishment of servants; he has a stock of cattle, a garden, provision grounds, a good stable, with two or three good horses. To this he adds a handsome top gig, or more generally now a Yankee phaeton; his several jobbers are mixed up with the pay-lie of the plantation labourers. Madam, if she is industriously disposed, employs some of the intelligent labourers to huckster round the country salmon, fish, port, calicoes, &c. their job work being lumped in with plantation work. All this I see and know. A manager has should compare in position to a bailiff in England; and an attorney here to a steward in England. If either of them overstep these characters (which all do), the proprietor has only himself to blame.'

It would thus appear that the grand experiment of competition with free against slave labour cannot be effectually made under the existing social condition of the West Indies. Encumbered estates would require to be sold or abandoned; proprietors living as absentees in England would require to relinquish, or go at once and reside upon and cultivate, their estates; the whole race of attorneys, stewards, and mortgagees, would require to be thrown away. Persons of intelligence, capital, and enterprise, who will not disdain to direct and superintend personally the working of their properties, are now, to all appearance, the men for the West Indies. We have already heard of such acquiring estates at an insignificant price, with every prospect of doing well upon them. Never was there a better opportunity for young men of this class making a fortune. Large estates are to be had for a trifle, and no kind of property would be so certain of yielding a good return. Whether there is to be a great and gradual regeneration of the West Indies by these means, will in some measure depend on the withholding of protective duties. Should these, in spite of all objections, be aggravated, with a view of bolstering up a vicious system of management, enterprise and self-reliance will be discouraged, for it is the very tendency of protection to induce indolence and dependence. The West Indies, in a word, must be left to their own resources; and all that we are called on to do is, to accord them the

greatest freedom of navigation, manufacture, and trade, and to place only a reasonably-qualified restriction on their engagements with negro immigrant labourers. Consistently carried out, there are the strongest grounds for believing that measures of this kind would in a few years raise the British West Indies into a state of prosperity superior to what they ever enjoyed under the deadening trammels of commercial protection.

'OLD WISDOM.'

THE environs of Molsheim are amongst the fairest in the rich and fertile province of Alsace. The verdant pasturages which surround this little town are watered by the river Bruche, and scattered hamlets and highly-cultivated fields diversify the scene, whilst the bold mountain-range of the Vosges lend a certain grandeur to its aspect. The landscape, alternately rural and wild, arrests our attention each moment by some fresh contrast. Beyond these meadows spangled with flowers, these golden corn-fields, and blooming orchards, the mountains appear in the distance, covered with their dark pine woods, which cast a gloomy shadow over the valley beneath; and yet this sombre background serves only as a setting to the landscape—a cheerful character predominates throughout. The hamlets are white and glistening, the little gardens carefully kept, and the roads shady and pleasant. Here and there may be seen little wayside inns, used, not so much as resting-places for the wayfarer, as points of rendezvous for the neighbouring peasantry, where the young men meet to form plans for amusement, the middle-aged to escape from some domestic care, and the more advanced in years to renew the remembrances of their youth.

Several guests were seated on a bench at the door of one of these rustic taverns, and their boisterous merriment proved that the glass had not circulated in vain. The entertainer, who might easily be recognised by the care he took duly to replenish the glasses of his companions, was a young man in the heyday of life, but whose furrowed countenance indicated the indulgence of violent passions. His dress marked him out as being less of a peasant than of a workman. He had just called for a bottle of cherry brandy with which to regale his companions, when one of the party, looking up the road, exclaimed, 'Bring another glass here, my friends; here is Father Solomon!'

'The Old Anabaptist!' was re-echoed on every side. 'Oh let us make room for him by all means,' said the giver of the treat; 'I must have a glass with Old Wisdom.'

The new-comer, whose approach had been thus hailed, was a man far advanced in life, wearing the grave and antique garb which is peculiar in those parts to the sect of Anabaptists. He walked with a firm step, which denoted neither haste nor slothfulness, leaning the while on a staff formed from a knotted vine. His countenance was venerable, and yet full of cheerfulness. As soon as he came within hearing, all the guests began to call to him to join them, and the master of the entertainment rose and advanced to meet him.

'Good-day to you, Andrew,' said the old man in a friendly tone; 'and good-day to you, Stephen, and all of you. Is it here, then, my friends, that you pray to God on the Sabbath day?'

'And you, Father Solomon,' inquired Stephen, 'from what church are you coming here through the meadows?'

'I am coming from the greatest of all earthly temples, my children; even from that whose incense is the perfume of the meadows, and whose music is the harmonious voice of all creation.'

'That is to say, you are coming from your fields,' replied Andrew. 'Well, sit down there now, good father, and tell us whether your wheat looks well?'

'Tell me first of all how you happen to be in the country now?' replied the old man as he seated himself at the place which had been left vacant for him. 'How

long has Mr Ritter's mill been able to get on without you?

'What are Ritter and his mill to me?' exclaimed Andrew, whose countenance darkened at this question. 'I care as much about them as I do about what is passing in the moon.'

'Have you quarrelled with your master, my son?' inquired the Anabaptist.

'I have no longer any master, Father Solomon,' hastily replied the young workman. 'I left the mill yesterday, and may it henceforth have nothing to grind, unless it be old Ritter himself! never will it have crushed worse grain.'

He then began to recount to the old man the long list of grievances which had finally led to his leaving the mill, of which he had been for ten years the director, mingling his narrative with imprecations against the owner, whom he accused of the basest ingratitude.

The Old Anabaptist listened tranquilly to the whole recital, and then calmly replied, 'You have drunk the wine of anger, Andrew, and you see all your master's faults double. All you have now said only acquaints me with one fact—that you are out of place.'

'And do you think that I am the one most embarrassed by that?' inquired Andrew. 'Ask old Ritter what he thinks about it; see half his mills stopped, and every day that they stand still robs him of fifty crowns—that is, of fifty pieces of his flesh. The old miser will fall sick of vexation even before he is ruined. And this is what makes me so jovial to-day, Father Solomon; because what causes grief to old skin-flints, rejoices the heart of all good fellows. Here, more glasses, my friends, and let us drink to the discomfiture of the Jew of Molsheim.'

The Anabaptist took no notice of this challenge, and asked Andrew what he thought of doing.

'I,' exclaimed the young miller; 'why, I mean to live like a *bourgeois*. Ritter was obliged to clear off all scores, and to line my pouch well before we parted. So long as any broad pieces remain to me, I mean to have a merry time of it.'

'And you have begun to-day to put this plan in execution?' inquired the old man.

'As you may perceive,' replied Andrew, whose utterance was becoming somewhat indistinct, 'we are trying the taste of all the casks in the inn. Hullo! mine host, hast thou nothing new to bring us? Let us have some little *liqueur* here quickly that may soften the heart of Old Wisdom.'

But the old man, as soon as he had tasted the few drops of cherry brandy which he had allowed to be poured out for him, prepared to go on his way. Andrew, however, seemed resolved to detain him.

'Stay, good father,' he exclaimed; 'there is always both pleasure and profit in hearing you talk.'

'Yes,' said another, 'you must sing us some of the old German hymns.'

'Or you will tell us stories out of the Bible,' added a third.

The Old Anabaptist made some attempts at resistance, but they would not listen to any excuse: first his hat was carried off, then his staff, and finally he was forced to resume his seat by the side of Andrew.

The old man showed no symptoms of ill-humour at this species of friendly violence which was offered him. 'Everything must give way to youth,' said he cheerfully; 'but since you will keep me in spite of myself, you must take the consequence, and put up with one of my sermons.'

'Preach away—preach away then, Father Solomon,' exclaimed the merry group with one voice; 'we are all ready to listen.'

This willing acquiescence was easily to be accounted for by the knowledge possessed by Andrew and his companions of the nature of the old man's general mode of instruction. What he called his sermons were for the most part histories or parables taken from the Sacred Writings, whence he always drew some useful

lesson; and even those who made but small count of this latter part of his discourses, liked to listen to the old man's narratives, even as they would have done to some fireside legend. Father Solomon was in their eyes a sort of romancer, whose inventions amused their imagination, even if they did not enlighten their reason. Andrew filled the glasses once more, and the whole party, each resting his folded arms upon the table, bent forward to listen with the deepest attention.

The old man proceeded. 'I will not relate to you,' said he, 'this day either any legend of our country or any stories drawn from the Sacred Volume; either one or the other would be too grave for your present mood. I will rather treat you as children, by telling you a nursery tale as it is related on the other side of the Rhine.'

'In olden times, then, when everything was different from what it is now-a-days, there lived at Mannheim a young man named Otto, who was intelligent and daring, but who never knew how to accomplish one important feat—that of bridding his own passions. When he desired a thing, nothing could prevent him from attaining it; and his passions resembled those stormy blasts which sweep across rivers, valleys, and mountains, destroying all that opposes their progress. Being wearied of the tranquil life he led at Mannheim, he took it into his head one fine day to set out on a long journey, with the hope that he might discover fortune and happiness in its course. He accordingly swung upon his shoulder a packet containing his best clothes, placed in a belt around his waist all the money he possessed, and started on his way without knowing whither he was bound.'

'After journeying on for some days, he found himself at the entrance of a forest, which seemed to stretch on all sides as far as the eye could reach. He here encountered three other travellers, who seemed to have paused, like himself, to repose themselves before plunging into its depths. One was a tall, proud-looking woman, with a threatening aspect, who held in her hand a javelin; the other a young girl, who lay half asleep in a chariot drawn by four bullocks; and the third was an old woman clad in rags, and with a rugged men. Otto saluted them, and inquired whether they were acquainted with the road through the forest; and on their replying in the affirmative, he requested permission to follow them, lest he should lose his way.'

'They all three consented, and proceeded on their way in company with the young man. The latter soon perceived that his companions were endowed with powers which God has not bestowed on all his creatures, but this discovery awakened no uneasiness in his mind, and he pursued his journey, chatting the while with his three fellow-travellers.'

'They had already gone on thus for some hours together, when they heard a horse's tread approaching. Otto turned round to see who it was, and recognised a bourgeois from Mannheim, whom he had hated for many a long year, and whom he looked upon as his greatest enemy. The bourgeois soon gained on the pedestrians, glanced at Otto with a scornful smile, and passed on. All the young man's ire was roused to the utmost. "Ah!" he exclaimed, "I would give all I possess now, and the best part of my future inheritance to boot, if I could only revenge myself on that man for his pride and his malice." "Do not distress yourself about that, for I can easily satisfy your wish," said the tall woman with the javelin. "Shall I transform him into a blind and infirm beggar for you? You have only to pay me the price of the transformation." "And what would the price be?" eagerly inquired Otto. "The right eye." "Gladly would I give it to be really avenged."

'The young man had hardly uttered the words, when the promised change was effected in the rich bourgeois, and Otto found himself at the same moment blind of an eye. He felt at first somewhat dismayed; but he soon consoled himself for his loss by remembering that his remaining eye sufficed to give him the enjoyment of witnessing the sight of his enemy's misery.'

'In the meanwhile they continued to walk on for several hours without seeing any end to the gloomy forest; the road was each moment becoming more hilly and rugged. Otto, who was beginning to feel somewhat fatigued, looked with an anxious eye upon the chariot in which the youngest female of the party lay half reclining at her ease. It was so ingeniously constructed, that the deepest ruts hardly gave it more than a gentle swing. "All roads must appear short and good in this chariot," he said, approaching it with a wistful look: "I would give a great deal to have one like it." "Is that all you want?" rejoined the second of his companions. "I can satisfy your desire in a moment." She struck with her foot the chariot which bore her. It seemed to unfold itself, and a second chariot, of exactly the same graceful and easy proportions, and drawn by two fine black bullocks, presented itself to his astonished view. When he had somewhat recovered from his amazement, he thanked the young girl, and was about to step into his newly-acquired vehicle, when she motioned to him to stop. "I have," said she, "fulfilled your desire, but I do not intend to make a worse bargain than my sister; you gave her one of your eyes, I require one of your arms."

'Otto was at first somewhat disconcerted by this request; but he was beginning to feel very weary; the chariot seemed waiting most invitingly to receive him; and, as I before told you, he had never been accustomed to resist the impulse of the moment. So, after some slight hesitation, he agreed to the bargain, and found himself seated in his new equipage, but at the same time deprived of his right arm. They now proceeded for some time on their journey without interruption. The forest seemed to stretch itself out to an interminable length. Otto soon began to feel the cravings of hunger and thirst. The old woman clad in rags quickly perceived it. "You are becoming gloomy, my lad," said she. "When the stomach is empty, discouragement is not far distant; but I possess a sure remedy against want and despair." "What is it then?" inquired the young man. "You see this flagon which I carry often to my lips?" she replied. "It contains forgetfulness of pain, joy, and the brightest visions of hope: whoever drinks of it becomes happy; and I will not drive with you a harder bargain than my sisters, for I only require in exchange one-half of your brain."

'This time the young man rejected the offer. He began to feel a sort of terror at these successive bargains. But the old hag induced him to taste the liquor contained in the flagon, and when he had once done so, it appeared to him so delicious, that his resolution gave way, and he acceded to the bargain. The promised effect was not long in making itself felt. Scarcely had he quaffed the tempting beverage, when he felt his strength revive, his heart became joyous, and full of confidence; and when he had sung all the songs he could remember, he fell quietly asleep in his chariot, perfectly indifferent as to what might become of him. When he awoke, his three companions had disappeared, and he found himself alone at the entrance of a village. He attempted to rise, but one side of his body seemed paralysed; he tried to look about him, but the one eye which now alone remained to him was dim and uncertain; he tried to speak, but his tongue faltered, and his ideas were confused. Now at length he began to comprehend how great were the sacrifices to which he had so lightly consented. His three fellow-travellers had degraded him from the level of humanity—a crippled idiot, no other resource remained for him than to beg his daily bread from door to door during the remainder of his days.

Here the Old Anabaptist ceased. Andrew struck his fist upon the table, and burst into a noisy laugh. 'Miserable!' said he, 'I think your friend Otto was a fool, Father Solomon, and that he only got what he deserved. As to his three companions, they were thorough sharpers, whose names I should be glad to know, that I may take care to avoid them.'

'It is easy to tell you that,' said the old man, 'for their names are well known to all. The name of the tall woman with the javelin is Hatred; that of the young girl reclining in the chariot is Sloth; and that of the old hag with the flagon is Intemperance.'

'Well, I can quite understand that when one has to deal with such customers, one gets the worst of the bargain,' replied the young miller; 'but still I abide by my old opinion, Otto deserved no better.'

'Alas!' replied the old man gravely, 'I know some other people in the world who are no wiser than he was. What should you say, for instance, to a lad who, for the sake of ruining a master with whom he had quarrelled, exposes himself to the misfortune of being left without employment? Do you think he is blessed with his full sight?—or has he not rather sold one of his eyes to Hatred? Add to this, that he wishes to give himself what he calls a "merry time of it"—that is to say, to taste the pleasures of idleness, without reflecting that, once unaccustomed to labour, and enervated by idleness, he will no longer find it so easy to regain the use of the two stout arms which in former days constituted his wealth. Finally, to console himself under his vexations, he has already lost in the tavern one-half of his senses, and he will, before long, be deprived of the use of them altogether. If Otto was a fool, what opinion can Andrew have of one who is imitating his example?'

The group began to laugh; Andrew alone remained grave and silent. He did not seek any longer to detain the Old Anabaptist, but suffered him to depart without even saying farewell. Evidently the lesson had wounded him, as lessons which come home to our consciences generally do. But such counsels are often like those bitter draughts which at first are not only distasteful to our palate, but seem even to increase our malady; yet afterwards they prove a means of restoring us to health. Andrew reflected all night on Otto's history, and next morning he returned to Monsieur Ritter's mill, where he resumed the duties which he ought never to have abandoned.

EASTERN LIFE PRESENT AND PAST.*

MISS MARTINEAU has committed an inadvertence in the preface to this book, which operates disadvantageously on its reception by those critics who compete with each other in priority of reviewing. She has mentioned the work merely in its character of a *journal of travels*; and as an author should know best what he has intended to write, few hasty examiners are likely to consider it in any other point of view. As a mere journal of travels, it is unquestionably open to the accusation constantly brought against it, of bookmaking, and more especially of the old-fashioned sin of seizing every opportunity of ekeing out the chapter by the aid of bygone historical matter. But if we let the preface alone, and look at the work in itself, we find it something very different from a journal of travels. The very titles of the four books into which it is divided ought to be sufficient to correct our first impression: Egypt and its Faith—Sinai and its Faith—Palestine and its Faith—Syria and its Faith. It is, in fact, a historical essay, written in the localities of the history, and illustrating the lucubrations of the learned by actual observation both of monuments and manners.

There is no living writer better fitted for a work of this kind than Miss Martineau. She is eminently an illustrator. Without the power to originate speculation, she is highly gifted in simplifying and popularising it. Unable to lead, she yet does more than follow; and the light which her talent for minutiae throws upon the objects of research, must sometimes both surprise and

benefit their discoverer. But while cheerfully awarding her the praise of illustration, we must not conceal that she is subject to the usual faults of a mere illustrator. It is her business to explain, and therefore she must explain—or seem to do so. There are to her no difficulties she cannot surmount, no depths she cannot fathom, no mysteries she cannot solve. When the old geographers came to a part of the map of which they were ignorant, they wrote in it the words *terra incognita*: these are words which have no place in Miss Martineau's ample vocabulary. We may have an opportunity of exhibiting an instance or two of this defect in passing along; but our main business, of course, is to show the general spirit and character of the book.

It will be understood, no doubt, that in so far as the localities are concerned, this is a mere fashionable tour; and that the chief merit of the book, in its lighter parts, most consists in its presenting well-known objects in a new point of view, or at least with such adjuncts as confer an air of novelty upon the picture. This is precisely our author's forte. She sees more than most people, and very often sees differently, and has the faculty, besides, of investing even the most commonplace circumstances with an extrinsic interest belonging partly to imagination and partly to style and manner. The first thing in the book that strikes us as characteristic of Miss Martineau, as well as amusing in itself, is the antipathy she takes to the camel the moment she sets eyes upon that modern antique. 'Presently a string of camels passed through the Square, pacing noiselessly along. I thought them then, as I think them now, after a long acquaintance with them, the least agreeable brutes I know. Nothing can be uglier, unless it be the ostrich, which is ludicrously like the camel in form, gait, and expression of face. The patience of the camel, so celebrated in books, is what I never had the pleasure of seeing. So impatient a beast I do not know—growing, groaning, and fretting whenever asked to do or bear anything—looking on such occasions as if it longed to bite, if only it dared. Its malignant expression of face is lost in pictures; but it may be seen whenever one looks for it. The mingled expression of spite, fear, and hopelessness in the face of the camel, always gave me the impression of its being, or feeling itself, a damned animal. I wonder some of the old painters of hell did not put a camel into their foreground, and make a traditional emblem of it. It is true the Arab loves his own camel, kisses its lips, hugs its neck, calls it his darling and his jewel, and declares he loves it exactly as he loves his eldest son; but it does not appear that any man's affection extends beyond his own particular camel, which is truly, for its services, an inestimable treasure to him. He is moved to kick and curse at any but the domestic member of the species, as he would be by the perverseness and spite of any other ill-tempered creature. The one virtue of the camel is its ability to work without water; but out of the desert, I hardly think that any rider would exchange the willing, intelligent, and proud service of the horse for that of the camel, which objects to everything, and will do no service but under the compulsion of its own fears.'

The next originality is what she calls the 'after-glow'—a natural phenomenon we do not recollect to have ever seen alluded to before. 'I do not remember to have read of one great atmospheric beauty of Egypt—the after-glow, as we used to call it. I watched this nightly for ten weeks on the Nile, and often afterwards in the desert, and was continually more impressed with the peculiarity, as well as the beauty, of this appearance. That the sunset in Egypt is gorgeous, everybody knows; but I for one was not aware that there is a renewal of beauty some time after the sun has departed and left all gray. This discharge of colour is here much what it is among the Alps, where the flame-coloured peaks become gray and ghastly as the last sunbeam leaves them. But here everything begins to

brighten again in twenty minutes: the hills are again purple or golden—the sands orange—the palms vibrant—the moonlight on the water a pale green, like sea-lilac surface; and this after-glow continues for ten minutes, when it slowly fades away.' But it is vain to attempt giving any idea here of the scenic descriptions that sparkle in almost every page. These occur with special effect in the voyage up the Nile, during which our author seems to have been in a perfect fever of delight. The pranks of the crew, and their impressions of the Europeans, even when the latter nodded and fell asleep—the veiled women coming down to the river to fill their water-pots—the religious ablutions and prostrations of the men—the harrow drawn by a camel—the almost naked Arabs employed in irrigation with the primitive pole and bucket—the buffaloes swimming from bank to bank—the ferry-boats with all rugged sail and heterogeneous freight—the sugar-canes, wheat, and lupins, fringing the banks and clothing the slopes—the towns and villages dotted with acacia groves—all thus reported the observer into a world of poetry and romance. And then the change of scenery in the night: the object was perceptible on the high black eastern bank, above and behind which hung the moon; but in the golden track on the dimpled waters were the shadows of palms, single and in clusters, passing over swiftly—"authentic tidings of invisible things." And then the rising of Orion—which "shone forth, night by night, till the punctual and radiant apparition became almost oppressive to the watching senses." I came whetted to know his first star as it rose clear out of the bank. He never issued whole from a haze on the horizon, as at home. As each star rose, it dropped a supple upon the surface of the still waters; and 'od a cam' nigh it was hard to say which Orion was the brightest. But the stars and the water yield to the glare like red that extend till they are lost in the distance, and these are all the better for the villages, overshadowed by dark palms, that dot the expanse, and the Arab bandmen and their camels wandering by the river side. In our walk this evening we saw a pretty detachment of Albanian soldiers among the palms. One had to rub one's eyes to be sure that one was not in a dream. The open tent, with the blue smoke rising from the group of soldiers, in their Greek dress, on the ground, and seen between the palm stems—the arms piled against the tent, and glittering in the last rays of the sun—all this was like a sublimated opera scene. And there was another, the next morning, when they took their departure southwards, their file of loaded camels winding away from under the shade into the hot light. At a variety, a man would be seen crossing the Nile where it was very wide on a bundle of millet stalks, carrying his clothes on his head like a huge turban. The same person, I recollect to have read, prevails upon the natives, but there the water-chariot is usually drawn by a camel, the voyager having hold of the animal by his tail.

In another picture our author figures the person, and in a way which will surprise those who are not aware that literary ladies are frequently women, and sometimes philosophers. The morning after visiting the phantime, the 'Island of Flowers' she got on her to damp and fold linen, and then employed herself in sewing till dinner-time. 'By sparing a few hours per week, Mrs Y—and I made neat and comfortable the things washed by the crew; and when we saw the sight of other travellers—gentlemen in rough-ried coats, and ladies in gowns which looked as if they had been merely wrung out of the wash-tub—we thought the more trouble our ironing cost us well bestowed.' This was a great mystery to the Arabs, and one which they never succeeded in comprehending. Another boat's crew, after a long consultation on the use of the garment, had decided that it was the English way of wearing it. The dragon of another party, being annoyed at ironing his employer's white trousers, positively declined the attempt; saying that he had once tried, and at the first touch had burnt off the right leg! But Miss Mar-

Allegory, indeed, not merely from comfort, but on principle. 'It is a thought,' says she, 'and I always shall think, that the finest specimens of human development I have seen are in the United States, where every man, however learned and meditative, can ride, drive, keep his own horse, and, if he will, own a dwelling; and every woman, however intellectual, can do, if necessary, all the work of her own house. At home, I had seen one extreme of power, in the meagre helpless beings whose potentia lies wholly in the world of ideas; here I saw the other, where the dominion was wholly over the power of outward nature.' This reflection was recalled to her memory when ascending the cataraet of the Nile, where, as she would come riding down a slope of roaring water as confidently as I would ride down a sand-bank, my own, in their arms, in their fighting method of swimming, as round like the spokes of a wheel. Graining down, bonoled in the currents, and little seven-year-old savages must haul at the ropes, or ply their little poles; when the kamdis approached a spike, of rock, or dare to thrust their shoulders between its keel and any unseen obstacle, and after every such feat, they would bow up their dripping heads, and cry 'bak-shah!' I felt the great peculiarity of this day to be my seeing, for the first, and probably the only time of my life, the perfection of savage faculty; and truly it is an interesting sight, only of a kind to excite enthusiasm.

On reaching Philo, the Holy Island, the enthusiasm of this change to the enthusiasm of religion, and it is no longer Miss Martineau who speaks to us, but an ancient priestess. Her first view of this congeries of temples, and something of fatality in it; for when their temple was being towed against the headlong current by the crew, walking on the rocks, the rope suddenly snapped, and she swirled down and away, none of us knew whether, unless it was to the bottom of the river. The stern, however, caught on a sandbank, and being obliged to bring to for the night, the party set forth in another boat for Philo. And what a moment it was when we took the soil, as sacred to wise old races of men, as sacred, now, to the Mohammedan, or Jerusalem to the Christian; the huge pyroly, the sculptured walls, the colonnades, the hypethral temple, all standing in full majesty under a flood of moonlight! The most sacred of ancient paths was in my mind all the while as it breathed into me from without; the awful solemnity of him who sleeps in Philo. Here, surrounded by the impenetrable Nile, sleeping to the everlasting music of its distant cataraet, and watched over by his temple, whose temple seems made to stand for ever, was the beneficent Osiris believed to lie. There are many Holy Islands, scattered about the seas of the world; the very name is sweet to all ears—but no one has been so long, and so deeply sacred as this. The waters all round were this night very still; and the moon suggestive was they of the olden age, when they afforded a path for the processions of grateful worshippers who came from various points of the mainland, with their jugs, and their harps, and their gifts, to render thanks for the harvests which had sprung and ripened at the bidding of the god. One could see them going in their boats, there, where the last western light gleamed on the river; one could see them land at the steps at the end of the colonnade; and one could imagine this great group of temples, lighted up till the prominent sculpture of the walls looked almost as bright and real as the moving forms of the actual worshippers.

It is a thought, which governs our author in beholding, with the eyes, both of the soul and body, the life past and present of the East. It is the old thought that all knowledge is sacred, all truth divine. The ideas that now influence the dominions of mankind are as much as the civilization of Egypt; and for aught we know, the old ideas of the old Egyptians, what they were, and what they are, and what they are not, are still the same. But Miss Martineau

has been to the Christians. In this, without giving any opinion as to the fact, we venture to think there is more of the appearance than the reality of heterodoxy. All Scripture is full of foreshadowings and prototypes; and even when the family unity of mankind was completely lost, that Jehovah was by no means the peculiar God of a single tribe; is affirmed in the person of that mysterious Melchisedek, king of Salem, and 'priest of the most high God,' to whom Abram gave tithes of the spoils of battle, and after whose order was Christ declared, both by the prophets and the apostles, to be a king and a priest for ever. Osiris, whose sacred name Herodotus (the follower of a different faith) did not dare to pronounce, 'left his place in the presence of the Supreme, took a human form (though not becoming a human being), went about the world doing good to men, sank into death in a conflict with the Power of Evil; rose up to spread blessings over the land of Egypt and the world, and was appointed Judge of the Dead, and Lord of the heavenly region, while present with his true worshippers on earth, to do them good.' Among his allusive names were 'Opener of Good,' 'Manifester of Grace,' and 'Revealer of Truth,' and he was described as 'full of grace and truth.' In his name the virtuous entered into blessedness. Miss Martineau mentions the different theories by which learned men have attempted to account for this resemblance to a holier personage; but it is easy to perceive that she holds with those who, seeing that ideas are the highest subject of human cognisance, the history of ideas the only true history, and a common holding of ideas the only real relation of human beings to each other, believe that this great constellation of ideas is one and the same to all these different peoples; was sacred to them all in turn; and became more noble and more glorious to men's minds as their minds became strengthened by the nourishment and exercise of ages.' This is all we can afford upon so abstruse a subject; but it was impossible to avoid some allusion to it in a notice of such a book.

Our author's descriptions of the monuments of Egypt are always happy, but her picture of the ancient capital of the Pharaohs is curious for its brevity. In the days of Abdallatif, the ruins occupied the space of half a day's journey every way, and the learned physician of Bagdad was in ecstasies of admiration at the splendour of the sculptures. 'At the end of seven centuries,' says Miss Martineau, 'the aspect of the place is this. From the village of Mitrahenny (which now occupies the site) can be seen only palm woods; a blue pond, rushes, and a stretch of verdant ground, broken into hollows, where lie a single colossus, a single capital of a column, a half-buried statue of red granite, twelve feet high, and some fragments of granite strewn among the palms. This is all of the mighty Memphis!'

In her visit to the mummy-pits, idealising and explaining all things as usual, she endeavours to account for the funereal pomp and religious worship lavished upon cats and birds, by the reverence of the Egyptians for instinct; but she fails to show what claim these animals had, upon this principle, above the camel, the horse, or the ass. This is one of those spots on her varied map on which it would have been better to have written words analogous to the *terra incognita* of geographers. But such prudence would not have suited her intellectual habits—perhaps not her organisation. A curious proof of the peculiarity of the latter is given in her description of the ascent of the Pyramid. She forgot to take with her that instrument usually so indispensable to an absolutely deaf person—her ear-trumpet; but although eagerly conversing for nearly an hour with those around her, as might be expected in such new and exciting circumstances, she found no difficulty in hearing till she got down again to common life on the ordinary level of the desert! The view from the Pyramid, after all the fatigue of the ascent and descent—for there appears to be no real danger—is described in a sentence or two, and is probably not worth the trouble it costs.

In taking leave of ancient Egypt, our author gives a picture of its life, which, although interesting, has not novelty enough to tempt us to extract at length. This Egypt is buried in sand; but the desert has answered to the interrogatories of learning and science, and we all know now that the ladies before the Flood lounged on chaises longues, and knitted, and netted, and darned as ours do; and that the little girls had dolls, and instead of yelping bow-wows, little wooden crocodiles with snapping jaws. We know, too, that some two thousand years before Abraham's visit to Memphis, the people worshipped one supreme God, whose favour in this life, and acceptance by him hereafter, were held forth as the great desiderata of human beings. Their passage through death to immortality was pioneered by a Divine benefactor, who had become the judge of the quick and the dead. Their notions of creation were drawn from the phenomena of the Nile; and they were 'taught that every mind, whether of man or brute, was an emanation from the Supreme; and that the body was only its abode and instrument; the soul being, from its nature and derivation, immortal.'

Cairo is a threadbare subject; but Miss Martineau even there contrives to amuse us. 'The little rogues of donkey-boys were always ready and eager close by the hotel, hustling each other to get the preference—one displaying his English with, "God save the Queen ros bi!" another smiling amiably in one's face; and others kicking and cuffing, as people who had a prior right, and must relieve us of enorochers. Then off we went briskly through the Ezebekeyeh, under the acacias, past the water-carriers, with their full skins on their left shoulder, and the left hand holding the orifice of the neck, from which they could squirt water into the road, or quietly fill a jar at pleasure; past the silent smoking party, with their long chibouques or serpentine nargeelehs; past the barber, shaving the head of a man kneeling and resting his crown on the barber's lap; past the veiled woman with her tray of bread—thin, round cakes; past the red and white striped mosque, where we looked up to the gallery of the minaret, in hope of the muezzin coming out to call the men to prayer; past a handsome house or two, with its rich lattices, its elaborate gateway, and its shade of trees in front, or of shrubs within the court, of which we might obtain a tempting glimpse; past Shepherd's Hotel, where English gentlemen might be seen going in and out, or chatting before the door; past a row of artisan dwellings, where the joiner, the weaver, and the maker of slippers were at work, with their Oriental tools, and in their graceful Oriental postures; and then into the bazaars.' In these bazaars the tradespeople looked like kings and princes in fairy tales, and cheated like Europeans. The gentlemen of her party were purchasing clothes to wear on their journey in the desert; and 'after a world of effort, and of tying and hooking, and inquiring of prices, it came out that the clothes were second-hand; and they were pulled off much more quickly than they were put on.'

In Cairo, Miss Martineau gets into a passion about polygamy; and notwithstanding the schooling she had previously given her mind as to all sorts of liberality, she fairly declares that 'if we are to look for a hell upon earth, it is where polygamy exists; and that as polygamy runs riot in Egypt, Egypt is the lowest depth of this hell. I always before believed that every arrangement and prevalent practice had some one fair side, some one redeeming quality; and diligently did I look for this fair side in regard to polygamy, but there is none. The longer one studies the subject, and the deeper one penetrates into it, the more is one's mind confounded with the intricacy of its iniquity, and the more does one's heart feel as if it would break.' The following scene from her visit to a harem gives an idea of the intellectuality of the native ladies. 'But the great amusement was my trumpet. The eldest widow, who sat next me, asked for it, and put it to her ear, when I said "Bo!" When she had done laughing, she

put it into her next neighbour's ear, and said "Bo!" and in this way it came round to me again. "Bo!" two minutes it was asked for again, and went round a second time, everybody laughing as loud as ever at each "Bo!" and then a third time! Could one have conceived it? The next joke was on behalf of the Jewesses, four or five of whom sat in a row on the dewan. Almost everybody else was puffing away at a chibouque or a nargeeleh, and the place was one cloud of smoke. The poor Jewesses were obliged to decline joining us, for it happened to be Saturday: they must not smoke on the Sabbath. They were naturally much pilled; and some of the young wives did what was possible for them. Drawing in a long breath of smoke, they puffed it forth in the faces of the Jewesses, who opened mouth and nostrils eagerly to receive it. Thus was the Sabbath observed to shouts of laughter.'

So much for Egypt and its Faith, and its Life, Present and Past. The book relating to Sinai is quite as suggestive of reflection, but not very rich in extractable matter. Moses is of course its hero—that mortal but little less than divine, who brought forth into the desert a crowd of abject slaves, and converted them into a powerful nation; and who threw open to his meekest countrymen the loftiest mysteries of the Egyptian temple, converting the Israelites, in the midst of the gross darkness of the time, into a really 'peculiar' people. Our travellers followed, as well as they could, the track of the wandering Hebrews through the wilderness; and in their journey to Petra, Miss Martineau's recollections of biblical story are mingled with later events. 'We felt ourselves really now among the haunts of Esau and his tribe, and of the children of Ishmael, whose hand was against every one, as every one's hand was against them; and when, a little farther on, we stopped in a hollow of the hills to rest, it was strange to remember who came here in later days, and what an extraordinary depot this was for the merchandise of the East for a course of centuries. Up this pass came long trains of camels, laden with the silks, muslins, spices, and ivory of India, and the pearls of Arabia, and amber, gold, and apes from Abyssinia, and all the fine things that the luxury of Europe derived from the far East. These all came through Petra, and were lodged there for rest, and for no little traffic, as in a place wholly inaccessible by any foe. The eagle might pounce upon the kid among the acres of Petra, and the lightnings might dart down from the summit; but no human enemy could enter to steal, or arrow from human hand to destroy. Up this pass, then, had wound many a caravan laden with Oriental wealth; and in this hollow had rested perhaps many a company in ambush, and no doubt many a baffled foe. Those single trees, perched on fantastic heights, were some of them old enough to have been living in those days—landmarks to the traveller, and signal stations to the desert warrior.'

The descriptions of Petra and Mount Hor exhibit great graphic power; but our space warns us that we must hasten on to Palestine and its Faith—to Bethlehem and its fulfilment of the Promise, and realisation of all the human mind had panted after throughout so many thousand years. Miss Martineau deprecates the literal understanding of the Scriptures, which Coleridge called 'bibliolatry,' and turns to the great religious ideas which have 'been the guiding lights of man from the remotest past, and which Christ presented anew, purified and expanded! What an exquisite picture it is to stand where Jesus stood, and look around upon the old faiths and sectarian tenets of the world, and bring forth from them all a faith and hope which should, notwithstanding dreadful corruptions, elevate mankind through many future ages!—to have insight into the sacred mysteries of Egypt, and the ancient theology and Law of Sinai, and the ritual morality of the Pharisees, and the philosophical scepticism of the Sadducees, and the pure and peaceable and unworshipful aspirations of the Essenes, and to see how from all these

together come the ideas, and from the unseen world the spirit, of the religion which Jesus taught!" But these ideas, and this 'spirit' she avows do not belong to the existing phase of Christianity; and her announcement will be heard either with pity or indignation by the religious world, that the actual Kingdom has already come 'in the new heavens and new earth of the regenerated human mind.'

'Syria and its Faith' has but little to do with the epicurean plan of the book. It comes in near the close of the work, and Miss Martineau appears to have had no room to elaborate the fertile subject of Mohammedanism. From this department, however, we take a picture of the markets at Damascus. 'The goldsmiths' bazaar was one of the most interesting; not from the quality of the jewellery, but from the picturesque figures of the workers, bending their turbaned heads over the blowpipes in their little dim shops. The alleys where galloon-weaving and silk-chain making, and the manufacture of slippers, were carried on, were very attractive, from the number of children employed. The little boys, weaving and shoemaking, were extremely industrious. They appeared to put their "Arab intonality" into their work, young as they were. Sometimes, in curious contrast, a dealer of graver years would be seen fast asleep in the next shop, his head laid back on a comfortable pillow of goods, and his whole stock open to the attacks of any one who chose to steal. The prettiest sight in connection with the bazaar was when a net was drawn over the front of the shop, to indicate that the owner was at prayers.

'I was altogether disappointed in the silk goods of Damascus. I saw very few articles that I thought pretty, more or less, though the fabric was substantial enough. There was a vulgarity about the patterns—especially about those which were the most costly—which perplexed me till I learned the secret. The famous old Damascus patterns, the inheritance of centuries, and of which every Damascene is proud, have been imitated by our Manchester manufacturers, so as to become quite familiar to English eyes. The effect of this in Damascus is curious. The inhabitants import our cotton goods largely; and when they see their own patterns again, the gentlemen think they look as well as their own heavy silks; and they make their wives wear them instead, greatly to the discontent of the ladies. The evening to the Damascene husbands is very great; as indeed it must be, if we consider the cost of dressing a dozen women in one house—wives and hand-maids—in such costly articles as the heavy silks of Damascus. For my own part, I would rather wear Manchester cottons.'

REMARKABLE CASE OF SUSPENSION OF THE MENTAL FACULTIES.

PAINFUL, as the idea may appear, it seems certain that disease is one of the avenues by which we are to approach a knowledge of the character and functions of the human mind. A curious light is thrown on the subject by cases of suspension of the mental faculties through the influence of shocks sustained by the nervous system. Mr Dunn, surgeon, London, reported one such case of extraordinary interest a few years ago; it appeared originally in the 'Lancet,' but we have now before us a reprint in the shape of a pamphlet.

The patient was a healthy young woman, and a dress-maker. While living with her grandfather, July 14, 1842, she accidentally fell into a river which traverses the park of Lullingston in Kent. Rescued after a quarter of an hour's immersion, she was with difficulty restored to life; for several days she continued sensible, but indisposed; meanwhile she was removed to her home in London. On the eleventh day she was seized with a fit, which kept her in a state of complete stupor for four hours, on the cessation of which it was found

that she was deprived of the powers of speech and hearing, and the senses of taste and smell, and that her mental faculties were quite benumbed or paralysed, giving no indication that she recognised any of her friends about her. The only remaining media of communication with the external world were the senses of touch and vision. Her sensibility to objects coming in contact with her was excessive, inasmuch that the slightest touch would startle her. When left quite still, she appeared to be lost to everything that was passing around her. She did not even know her own mother, who attended upon her with the greatest assiduity and kindness. Mr Dunn goes on to state—'Her memory, and the power of associating ideas, were quite gone. Wherever she was placed, there she remained throughout the day. She was very weak, but her bodily health was not much deranged; the tongue was clean; the skin moist; and the pulse quiet and regular; but the bowels sluggish. Her appetite was good; but having neither taste nor smell, she ate alike indifferently whatever she was fed with, and took nauseous medicines as readily as delicious viands. She required to be fed. When I first saw her, she had no notion of taking the food that was placed before her; but a few days afterwards, if a spoon was put into her hands, and filled by her mother, and conveyed for a few times to her mouth, she would afterwards go on by herself until the whole was eaten.'

After some medical particulars, and an account of certain fits to which she was liable, Mr Dunn adds—'One of her first acts on recovering from the fit had been to busy herself in picking the bedclothes, and as soon as she was able to sit up and to be dressed, she continued the habit, by incessantly picking some portion of her dress: she seemed to want an occupation for her fingers, and accordingly part of an old straw-bonnet was given to her, which she pulled to pieces of great minuteness; she was afterwards bountifully supplied with roses; she picked off the leaves, and then tore them into the smallest particles imaginable. A few days subsequently, she began forming upon the table, out of these minute particles, rude figures of roses and other common garden flowers: she had never received any instructions in drawing.

'Roses not being so plentiful in London, waste paper and a pair of scissors were put into her hands, and for some days she found an occupation in cutting the paper into shreds; after a time, these cuttings assumed rude figures and shapes, and more particularly the shapes made use of in patchwork. At length she was supplied with the proper materials for patchwork; and after some initiatory instruction, she took to her needle, and in good earnest to this employment. She now laboured incessantly at patchwork from morning till night, and on Sundays and week-days, for she knew no difference of days; nor could she be made to comprehend the difference. She had no remembrance from day to day of what she had been doing on the previous day, and so every morning commenced *de novo*. Whatever she began, that she continued to work at while daylight lasted, manifesting no uneasiness for anything to eat or to drink, taking not the slightest heed of anything which was going on around her, but intent only on her patchwork. Occasionally, indeed, and not unfrequently two or three times in the course of the day, she would have what her mother called her "fits." Whilst intent upon her work, and without any external exciting cause, her head would fall backwards, her eyelids close, her arms and legs become rigid, and her hands clenched. After a short time, varying in extent from a few minutes to half an hour or more, the muscles would become relaxed, the eyes open, and she would resume her work, apparently unconscious that anything had happened. About this time she began to show indications of feeling interested in the figures of the flowers and buds, &c. upon the silk, and other materials which are made use of in patchwork. The perception of colours, and the exercise of the imitative

faculty, were the first evidences she exhibited of psychical advancement in her present state. Although she had received a good plain education, and had been very fond of books, now she could neither read nor write, nor even be made to comprehend the letters of the alphabet. All her former knowledge and past experience appeared to be obliterated, or at least for the time to be buried in oblivion; with one exception—a feeling of dread or fright in connection with water; and she now began, *de novo*, like a child, to acquire ideas, and to register experience. Admitting that the senses are the only inlets of all the materials of knowledge, it was not to be expected when in this abnormal condition, with only the senses of sight and touch in communion with the external world; that her progress could be otherwise than slow in the extreme. However, she evinced an interest in looking at pictures and prints—more especially of flowers, trees, and animals—but when shown a landscape in which there was a river, or the view of a troubled sea, she became instantly excited, and violently agitated, and one of her fits of spasmodic rigidity and insensibility immediately followed. If the picture were removed before the paroxysm had subsided, she manifested no recollection of what had taken place; but so great was the feeling of dread or of fright associated with water, that the sight of it in motion, its mere running from one vessel to another, made her shudder and tremble, and in the act of washing her hands they were merely placed in the water.

In January 1844, six months after the accident, she regained the sense of smell, and her mind began gradually to awake from its lethargy. Being taken back from London to her grandfather's in the country, she showed no recognition of the place, but bounded with delight at seeing the spring flowers, and even began to express her feelings in articulate language. A young man to whom she had been formerly attached was now brought to pay her daily visits; they pleased her, and she was uneasy when any accident prevented them. Thus matters went on till July, when her lover paying some attentions to another woman, she manifested the passion of jealousy, and at length, on witnessing a particular scene between the young man and his new mistress, fell down in a fit, which her friends feared would prove fatal to her. On the contrary, she awoke from it restored to 'the possession of her natural faculties and former knowledge, but without the slightest remembrance of anything which had taken place in the interval from the invasion of the first fit up to the present time.' She of course knew nothing of the apostasy of her lover; and her mother judged it well to remove her back to London, without any further disturbance to her mind from that cause. In the course of a few weeks she attained to her usual health in all respects. She had only lost a year of the memory of existence.

DR GAVIN ON BETHNAL GREEN.

A PROCLAMATION of the Scottish Privy-Council in 1619 speaks of Edinburgh as 'now become so filthy and unclean, and the streets thereof so overlaid with middings, as [that] the noblemen, councillors, servitors, and others his Majesty's subjects who are lodged within the said burgh can not have ane clean and free passage and entry to their lodgings; wherethrough they are resolved rather to make choice of lodgings in the Canongate and Leith, nor [than] to abide the sight of this shameful uncleanness, whilk is so universal, and in sic abundance through all the parts of this burgh, as in the heat of summer it corrupts the air, and gives great occasion of sickness.'" The city long continued to have a bad character in this respect, and one sometimes hears a conversation amongst ignorant people in the south, proceeding upon the supposition that Edinburgh is a strik-

ingly odorous city, when those who have seen it with their eyes know it to be as remarkable among towns of its size for cleanliness, as it is for the picturesque of its situation and its architectural elegance. The large towns of Scotland are generally under good and efficient police regulation—though no doubt there are some defiles about them; the houses of the extremely poor, which are by no means what they ought to be, and which it would perhaps be difficult for the most diligent besom to keep in decent order. While happy to think that our country has long got above this, as well as many other barbarisms, we Scotsmen never visit London without greatly commiserating the state of the nation who dwell therein; for not only is London ten times more the dirtiest place we ever set foot in, but its stench, which, apparently from the bewitching effect of its habit, has lost the wish to be clean. In London, every privilege and a possession. It is patriotism to praise and defend dirt. What hope of country life, then, to that London will ever live cleanly, whether with or without an abjuration of sack? Truly we regard the abject state of the metropolis with the sincerest pity.

We are led into these observations by perusing a treatise entitled 'Sanitary Ramblings, Being Sketches and Illustrations of Bethnal Green, a type of the condition of the Metropolis and other large towns.' The work is the production of Dr Gavin, lecturer on Forensic Medicine in Charing-Cross Hospital. One point in the title we demur to—the phrase 'and other large towns.' Some large towns have dirty corners, or even districts; but to rank any of them with omnifid London is the grossest injustice. Dr Gavin, being in practice in the eastern district of the metropolis, has, in a description of Bethnal Green parish, not a mere glance over the leading streets, but a searching scrutiny of every cluster of houses, every court and alley, and the interiors of a vast number of the dwellings themselves. The results he has given in detail, as well as in tables and summaries, implying the condition of each place as to paving, draining, and scavenging, and the consequent condition as to sickness and mortality, it is rarely that we have any such matter reduced to a form in which we can grasp it so well as in a definite fact. The houses are, in the first place, for the most part planted immediately on the ground, and below the general level of the surrounding soil; they are flimsily built, and in a ruinous condition; the inhabitants have damp to contend with both above and below. The rooms are at the same time small and overcrowded, so that, being unprovided with any means of ventilation, the most noxious air prevails in them all. These are particulars for which private parties, it may be said, are not responsible. Well, we only introduce them as the ground of the picture. Look now to those features of the case which properly come within the province of a police or municipality.

'House-drainage is nearly wanting in Bethnal Green, except in a very small number of cases, the houses, when they are provided with drains, drain only into cesspools; the number that drain into sewers is very small indeed. An immense number of the houses of the poorer class, and nearly all those in gardens, are unprovided with drains of any kind. The inhabitants, therefore, are compelled to get rid of their fluid refuse by throwing it on the gardens, yards, or streets. Sometimes holes are dug in the gardens or yards to receive the refuse water.

* Edinburgh Magazine, March 1818.

* London: Churchill, 1848.

These holes are frequently closely adjacent to the wells whence the occupants derive their supply of water.

A great number of the courts and alleys are altogether unprovided with house-drains, or where they do exist, they are mere surface-drains, and are nearly always choked up, and thus become great nuisances. A great portion of the disease in the parish is to be found occurring in these filthy undrained courts and alleys.

Then as to the removal of refuse.—The exterior appearance of the streets may, perchance, through the operation of paving and scavenging, be tolerably cleanly; but in scarcely any instance, when the houses themselves are visited, and the yards inspected, are not collections of all kinds of refuse, garbage, ashes, dirt, decomposing cabbage-leaves, and other offensive vegetable remains, oftentimes dung, and sometimes putrescent animal remains, to be found, either abundantly distributed over the surface of the dirty yard, or piled into a heap in a corner. In either case the heap is exposed to the action of the rain, which soaks into it, hastens decomposition, dissolves the putrescent, fetid matter, washes it over the surface of the yard, and causes it to form an intimate union with the soil. Truly does such a soil sow the seeds of disease and death; every rain which falls augments the quantity and power of the poison, every sun that shines raises a vapour charged with deadly poison. The times at which the contractor's cart goes round is not certain; no provision, therefore, can be made to have the refuse in readiness for him. In name, he is bound, on complaint, to remove collections of ashes, but in practice it is not so. Practically, therefore, the dust and garbage heaps of the poor must either remain on their premises, or they must themselves remove them. But they can only remove them from the yards to the streets; there, the refuse is deposited to rot and to putrefy, and mingle with the dust and mud, and to be scattered on the pavement, and to defile the passengers [exactly Edinburgh in 1619]. The filthy streets remain uncleansed till their filthiness startles the eye of the scavenging department. During all this period, whether the refuse be on the premises, where it is continually accumulating, or on the streets, it is giving off vapours loaded with unhealthy emanations. Wherever I went, I found the most loud and bitter complaints against the dust contractor for the filthy state in which the inhabitants were compelled to remain, in consequence of his never, or very rarely, removing their dust heaps. These complaints in many places assumed the tone of the deepest indignation, and evidently arose from an earnest conviction of a great outrage being committed upon them, and of a cruel negligence or indifference to their wants and necessities actuating the authorities. "The people never die here; they are murdered by the fever!" was the exclamation of one inhabitant in Half-Nichol Street. It is impossible but that discontent and disputes should arise, and that working men, finding their homes made wretched and uncomfortable, and surrounded with nuisances, should leave them, for the public-houses, there to learn, and soon to indulge in, habits of intemperance, which indulgence soon leads to vicious propensities, which in their turn give rise to a large class of crimes.

The details regarding a necessary class of conveniences are of so horrible a nature, that we must leave them to be studied in Dr Gavin's volume. So also must we pass over certain nuisances, where, for a profit and a livelihood, the most abominable and noxious works are carried on in the midst of a wretched population. Of the streets, many of the principal ones are paved, some, however, only within the last few years, and generally with a neglect of inclinations for the removal of surface water. Many others remain unpaved. The cleansing of the thirty-three miles of street, and the hundred miles of byways in the parish, is executed by 'thirteen decrepit old men,' being a sufficient power to go over the whole surface once in ninety days, though practically four streets are cleaned twice a-week, and

others once a fortnight. The courts are as they have been described. Dr Gavin adds:—For a few additional hundreds of pounds annually, the parish could be effectually cleansed, and kept clean, in all its streets, alleys, and courts every day. He also adds elsewhere:—The annual deaths of 852 persons is the price in life paid by Bethnal Green to support its present filthy state—a costly, and extravagant, and fearful sacrifice! The price, in the morals and happiness of the people, who shall attempt to reckon it!

Such is a sample of suburban London—very piteous to behold, as Mr Carlyle would say. It adds to the pain with which we reformers barbarians of the north regard such a deplorable state of things, that it might be remedied to some extent, were it not for that calculating spirit for which our southern neighbours are, however unconsciously, remarkable. 'It is presumed,' says Dr Gavin, 'that the most solid reason for the wretched condition of the great majority of the houses of the poor, and for the total absence of any attempts at improvement, consists in the fact, that the commissioners and guardians are themselves the chief proprietors of the dwellings of the poor; and that as they in general pay the rates themselves, and have already exacted for their tenements the highest attainable rents, any, even the slightest, increase of rates would only be an increase of their own expenditure.' Under such circumstances, he truly adds, to expect effectual improvements appears fallacious.

LIFE OF AN ARTISAN.

THERE is a volume before us which is not exactly to our taste. It is the life of a working-man by himself; or, to speak by the card, the 'Autobiography of an Artisan.' If it were nothing more than what it professes to be, we should like it much, for we can hardly conceive anything more interesting than a genuine account of the fortunes of a working-man, written in the plain matter-of-fact style of his class. And on the other hand, if it were what it aims at being—a sentimental and philosophical history of the same unit of society, the production of a thinking and cultivated mind, we should perhaps like it still better. But this is neither one nor other. Of the flippant style of the book, we may take an example from the author's account of his first effort at industrial occupation. 'In the beginning of my eleventh year I was put out as an errand-boy to a draper, a situation I always disliked; indeed there was so much artificial civility interwoven into our polished draper, that I regarded it as better adapted to men compounded of "clock-work and steam," than to those sturdy flesh-and-blood Saxon bred, as if it required a bad French bow to sell a good French shawl. I was considered too uncouth to succeed in a business requiring so much conventional polish; and want of address was thought to be rather a disadvantage than a service to my master. My playing and loitering, when sent on errands, became so frequent, that in a few months I was discharged as incorrigible.' No man ought to make such confessions without an expression of regret for his folly.

The account the artisan gives of his marriage, an engagement which he undertook when destitute of employment, without a home, and not even possessed of so much as the petty fee necessary to be paid on the occasion, is equally objectionable. Why not acknowledge that it is by such errors that too many of his class fasten themselves down to irretrievable poverty? Notwithstanding defects of this nature, the book contains many pages worth reading, and more especially some passages in the life of a party of strolling players, which are full of a nervous simplicity not often met with in the writings of the present century. The author and his wife had turned players at a pinch; and in many places, to use his own language, 'Hunger had marked us for his own—he mocked us daily with breadless breakfasts and meatless

dinner.' They were travelling on, loaded with the 'properties,' for they were too poor to employ a carrier; but the magistrates of the villages they passed through refused them permission to act, and the publicans, in reply to their request for a bed, seeing what they were at a glance, replied, 'No, no, no.' At length the desolate crew, with sore feet and sinking spirits, reached the village of Arnold, and after trying in vain every public-house they passed, arrived at the last. Here they became desperate, and ordering a whole pint of ale, and paying the threepence in ready cash, put the fateful question to the landlady—'Can we sleep here to-night?' and the answer was, "I will consult with the master. Let me consider: you are players, are you not?"

"Yes, madam," I answered. She saw it; our shabby-genteel appearance told the tale.

"Well," said she, "I will inquire, and let you know; but I do not know how it will be, for we have had some players here lately."

The answer was favourable—'They might stop if they liked.'

'Too frequently one difficulty courses another on the heels.' We had promise of beds, but how were we to pay for them? Threepence was already gone. We might fairly expect that the price would be demanded before we were allowed to couch our harassed limbs in Mrs Reid's bed-linen. We took the stock of our ready cash: we could raise sixpence in copper amongst us. I had twopence-halfpenny and two farthings; Messrs Younge and Manuel three-halfpence each. It was expected that such a sum would not suffice to find sleeping accommodation for six of us; so it was charitably settled that I should take the whole amount—sixpence; that would provide a bed for my family, and the other two gentlemen were to reconsider what could be done for themselves. After a short deliberation, they resolved to travel back again to Blidworth, where they had reason to believe a bed would be cheerfully offered to them. After a day's fatigue—one of hard walking and hunger—they imposed upon themselves a turmoil of eight miles, over dreary heath roads, to secure a bed for my family.'

Still a difficulty occurred—a delicacy—a punctilio—which it was not easy to get over. 'I had two farthings,' says our sensitive author, 'in my sixpenny-worth of copper coin: but what would "appearance" say if the manager of the strolling company just come in was obliged to offer fivepence-halfpenny and two farthings for his bed? Sixpence current it might be, but would it look like a real respectable silver sixpence? No; such a meagre tender would operate against my future prospects, and would at once stamp me

"Bare, and full of wretchedness."

The thought stung me. A night's rest would be but momentary relief, if my poverty was to drive me away the next morning. Some means must be devised to avert such misery, and, if possible, to prove my respectability. I hastened out, and paced the dark street until a twinkling ray brought me to the window of a large shop. I looked in; its multifarious piles bespoke it the storehouse of some village money-maker. An old gray-headed man, with spectacles resting upon a rather large nose, was poring over his day-book or ledger by the aid of a farthing dip, whose twilight threw the greater part of the large room into an awful gloom. All within was as still as the pillowed glade of a deep-robed forest at midnight, when the lazy winds have sunk to sleep. This, thought I, is the place wherein to effect my barter. I approached the old man, and asked, with all the politeness that my embarrassment could afford, "if he would favour me with change for two farthings?" This dealer in all sorts, whose name was Jones, was reputed doubly careful in guarding against loss in this world's dealings. He was scrupulously nice in all accounts of profit and loss; and in my case he could not see that a fraction of advantage was to be gained by the accommodation. After a long pause, he declined the favour, saying, "I would rather keep my halfpenny." I was rather anxious for the ex-

To expose my poverty was not, under present

circumstances, a thing to be proud of, so again I modestly pressed for the change. "Are they good ones?" cautiously asked the old sugar-plum. The answer was "Yes." "Well," said he, "I must try; but I do not see what I am going to get by you: but I suppose you must have the halfpenny. I hope I am not going to do myself any harm by this transaction." I thanked him, buttoned down the money, and hastened back to "my inn!"

The landlady was a nice, cozy woman. She sat down with them by the fire, snuffed the candle, and talked of the stage—but not encouragingly: the very reverse. The poor players began to tremble as they thought of their reckoning; and the husband, in his alarm, introduced the subject of his skill in stencilling, and gave himself an excellent character as an artist. Before bedtime, I had the pleasure of receiving an order from her to "slap-dash" her parlour. Tired bones avault! the lodgings are already paid; yes, and a smell of the frying chop, to be purchased out of the surplus money, is already expanding our collapsed stomachs! We retired to bed without our hostess demanding the pay; we slept comfortably, and dreamed of bacon and tea-cakes. The next morning we were joined by our two companions from Blidworth: the sixpence furnished all of us with an excellent dinner.'

THE COCKROACH ON SHIPBOARD.

Most people, particularly if in warm situations, either from climate or local influence, know something of the cockroach; yet though pestered by its invasions, they may be unacquainted with some portions of its history. At the risk of repeating what may be more or less known, I shall venture a brief detail of my own observations during an acquaintanceship of several years, when I lived in a very populous colony of the insect.

The family *Blattæ*, to which the cockroach (*B. orientalis*) belongs, is a very numerous and a very voracious one; and I first got acquainted with the species on shipboard, during a long voyage to the East. The insect is of a reddish-brown colour, with a body about an inch and a third long, and antennæ somewhat longer, making the entire animal about three inches. Those who have not seen an entire specimen, may have noticed portions of its legs and wings amongst the brown sugar in daily use, as it is fond of sweets, and happens sometimes to get entombed amongst its food. On first leaving England, being winter, not a trace of the insect was observed; but as we drew near the tropics, a few in the evenings began to make their appearance. These had evidently been dormant in their hiding-places during the many months the vessel lay in dock, and reanimated by the increased warmth, now issued forth to resume their predatory habits. Objects of observation and interest being limited at sea, I took a fancy to the rearing of cockroaches, just as persons at home, with a wider range of choice, take to rabbits or chaffinches, or as Barnum Trenck did to his solitary spider. My warren or colony consisted of a large jelly-pot covered with muslin, so as to permit inspection, but prevent escape. Here I reared many from the egg to maturity, and had them constantly for several years under my eye.

The female, which is somewhat stouter and shorter than the male, after expelling the egg, carries it some days about with her, fixed to the abdomen, ere she glues it up in some corner to be hatched. A new-laid egg requires six or seven weeks for this purpose, and then gives birth to fourteen or sixteen young ones. The egg itself is about a third of an inch long, of a compressed cylindrical form: it has a serrature along one side, which opens at the proper time for the escape of the young brood; and the heads of the young are all placed towards it in a double row. After impregnation, the first egg is deposited in the course of eight or ten days, and the female continues every eight or ten days thereafter to deposit fruitful eggs for many months. If kept apart when arrived at maturity, she lays no eggs. At the end of six or seven weeks, according to the state of the weather, the eggs are hatched, and the larvæ liberated from

their enclosure. They are then about the size of a lint-seed, whitish, semi-pellucid, and exceedingly tender, so as to be destroyed by the slightest touch. They have black eyes, and a darkish dull spot on the abdomen. In a few hours the skin hardens, and darkens in colour, from cream-colour to chestnut and deep brown, when the young insect runs nimbly about in quest of food.

Like all the tribe, when in this the larva state, they are, as they grow, under the necessity of casting their skins; and this curious process I have often observed and admired. The animal retires to some quiet corner, away from its fellows, and fixes itself in a depending position by its hinder claws. Remaining motionless for a few minutes, it begins to swallow air, and goes on doing this to such an extent, that its skin, no longer able to withstand the bursting pressure, splits open along the thorax or back. After the exertion thus used, it is forced to rest a while, when commencing afresh, it manages to wriggle its head and fore part of the body out at the opening; the antennae next follow to their very tips, then the legs, one after another, to the extremity of the claws, so that when completely extricated, the exuvia or cast skin is the exact counterpart of the animal it covered. When thus quit of its old covering, it suspends itself to it, completely exhausted, by the anal appendages. In this condition it is soft, white, and helpless; and if found by its neighbours, very apt to be eaten up. It, however, speedily regains strength; and its first act, on finding itself able, is to turn round and eat up the softer portions of its old skin. A new skin speedily begins to encrust it, increasing in strength as it deepens in colour, till in a few hours it possesses strength and colour equal to the one it has shed. As the body in the meantime is still enlarged by the swallowed air, the new skin partakes of that enlargement; and when the insect's stomach has disgorged its windy contents, these are replaced by more solid material, in the shape of food. How often the skin is shed and renewed during the larva state of the animal I was unable to determine, but the whole time occupied from hatching to maturity is from ten to sixteen months. Abundance of food and warmth expedite, and opposite circumstances retard, the final change. At the penultimate, or last shedding of the skin but one, the insect of course passes from the larva to the pupa state; but as is the case with many others of the tribe, there is no perceptible difference between the two, unless it be a little in point of size; and at the last shedding, when the pupa passes into the imago or perfect state, the difference at first seems as little, for the new wings are scarcely noticeable, rumpled up on its back. These, however, soon unfold, expand, and become strong, so that, in the space of half an hour, the animal so furnished assumes a very different aspect. I have stated that the insect in all its stages is of a deep ruddy brown colour, but occasionally a pupa may be seen beautifully speckled with interposed markings of pale yellow.

Notwithstanding the length of time which elapsed from the period of hatching to that of maturity, and the small apparent number that at first made their appearance on board, yet in little more than a year our vessel was literally swarming; and it may well be imagined that matters did not amend in this respect during the other two years of our voyage. They proved exceedingly annoying to us inmates of the 'wooden walls,' from their voracity, filthiness, and noisome smell, as no place on board was sacred from their intrusion; and where the large ones could not enter, the little ones crept in. Wherever we went, above, below, to the hold or the main-deck, there might some of their number be seen. They usually crawled about quietly during the day, or kept out of sight in their hiding-places, but at night exhibited their full force, and issued forth 'in shoals and millions.' At times during the night, and even sometimes during the day, the males, as if by one consent and impulse, bounced forth, fluttering their wings, and scampering along in irregular runs and short flights, striking one in the face, and crawling over his clothes,

up his coat-sleeves, and trousers. At these times they seemed perfectly indifferent about their personal safety, and could be caught and killed without trouble. After being about a couple of years at sea, my bed cabin was so grievously infested with their swarms, that I attempted to lessen their numbers by trapping and killing them. For this purpose I took a water ewer and baited it with a little treacle in its bottom; for of all sweets, and this in particular, they are exceedingly fond; and attracted by it during the night, they dropped in to satisfy their appetite. Once in, they could not again clamber up the steep, smooth sides of the vessel, and in this manner I had it filled, night after night, within two inches of the top; yet notwithstanding the thousands thus caught and destroyed, I found the task a fruitless one, for there was no perceptible diminution of their numbers. I had also a tame snipe which lived entirely on cockroaches, catching and gobbling them down with great expertness; but they at last repaid the favour in kind, by fastening on its breast when asleep, and eating the flesh off its bones.

For food the cockroaches scarcely refuse anything: in the destruction of books they are not inferior to the Goths and Vandals; and all sorts of paper, written and clean, except brown, afford them a meal. The best method of preserving books exposed to their ravages, is to cover them with clean washed cotton or linen cloth, which they will not touch; but if soiled with anything edible, they will gnaw it through in the soiled spots. Cork they like very well, and are not averse to rotten wood, especially if impregnated with oil, though the pure oil itself they do not touch; casks of oil have been lost by their perforations through the softer portions of the wood; and in fact all sorts of casks are liable to be thus unceremoniously tapped, if the contents suit their palates. They will make a meal off salt meat, if boiled, and are very fond of fresh, but indeed refuse no sort of animal matter their teeth can gnaw, and these are none of the softest; even birds' skins, smeared with arsenical soap, they will greedily devour, as I found to my cost. Biscuits are their delight, and they waste more than they eat; for not only do they drill them in holes, but smut them all over: so bad did our bread latterly become from this cause, that absolute want alone could have forced us to use it. Leather-covered trunks are stripped by them in a short time, and shoes pierced into holes; they drink ink, devour vellum, and batten on the ordure of fowls. A bit of their fellows affords a high relish, and one is no sooner wounded, and unable to defend itself, than he is lugged away and eaten up; but worse than all this, they attacked even us, the lords of creation, and frequently, during sleep, ate our flesh to the bone. Though no exposed part is free from their depredations, yet they are more particularly disposed to attack the points of the fingers adjoining the nails, where they nibble away the skin to the quick. They have their own likings too, and prefer certain individuals to others; so that while some have nothing to fear, others cannot fall asleep with any part of their person exposed without sustaining injury from their pincers. Often have I seen our chief officer get up in the morning with his neck and ears clotted with gore, whilst our third officer was scarcely if ever molested by them.

A ship much distressed by scurvy once put into Guam, part of whose crew, poor wretches, half dead in their hammocks, had their limbs literally eaten by cockroaches in holes to the bones; and a few who had died unobserved, or been gnawed to death, were taken out with the flesh half devoured. Great guns have been entered in logbooks as 'destroyed by cockroaches,' and the sailors declare that they eat the edge off their razors! The damp sea air and salt water had no doubt corroded the former into holes, where the insects found refuge; and licking the oil off the edge of the latter, they probably left a little moisture instead, which soon roughened and blunted the instrument.

Cockroaches, like all other animals, have their ene-

mies; probably the most destructive of these is man, for the sailor abhors them, and always endeavours to kill as many as he can. They have perhaps next in order several of the ichneumons—species of flies that, like the cuckoo, are not at the trouble to hatch their own young, but force this office upon others, at the expense of their own natural brood. Many cockroaches' eggs are thus pierced by the ovipositor of two sorts of this fly, a small and a large one. Of the former, instead of a brood of fourteen or sixteen young cockroaches, I have counted as many as one hundred and seventy-one in a single egg; of the latter there are never more than one. The grubs of these ichneumons of course feed on the contents of the egg, which sustains them till ready for their change to the perfect or insect state, when they pierce the shell and take wing.

EASY WAY OF GAINING OR LOSING FIVE YEARS OF LIFE.

Early rising has been often extolled, and extolled in vain; for people think that an hour's additional sleep is very comfortable, and can make very little difference after all. But an hour gained or wasted every day makes a great difference in the length of our lives, which we may see by a very simple calculation. First, we will say that the average of mankind spend 16 hours of every 24 awake and employed, and 8 in bed. Now, each year having 365 days, if a diligent person abstract from sleep 1 hour daily, he lengthens his year 365 hours, or 23 days of 16 hours each, the length of a *waking* day, which is what we call a day in these calculations. We will take a period of 40 years, and see how it may be decreased or added to by sloth or energy. A person sleeping 8 hours a-day has his full average of 365 days in the year, and may therefore be said to enjoy complete his . . . 40 years. Let him take 9 hours' sleep, and his year has but 342 days, so that he lives only 37½ ... With 10 hours in bed, he has 319 days, and his life is . . . 35 ... In like manner, if the sleep is limited to 7 hours, our year has 388 days, and instead of 40, we live 42½ ... And if 6 hours is our allowance of slumber, we have 411 days in the year, and live . . . 45 ...

By this we see that in 40 years, 2 hours daily occasion either a loss or gain of *five years*! How much might be done in this space! What would we not give at the close of life for another lease of 5 years! And how bitter the reflection would be at such a time, if we reflected at all, that we had wilfully given up this portion of our existence merely that we might lie a little longer in bed in the morning!

VARIETIES OF MILK.

As far as we know, no nation uses the milk of any carnivorous animal. There is no reason for believing that the milk of this order of animals would be either disagreeable or unwholesome; but the ferocity and restlessness of the creatures will always present an obstacle to the experiment. The different milks of those animals with which we are acquainted agree in their chemical qualities, and is confirmed by the fact, that other animals besides man can be nourished in infancy by the milk of very distinct species. Rats and leversets have been suckled by cats, fawns by ewes, foals by goats, and man, in all stages of his existence, has been nourished by the milk of various animals, except the carnivorous. The milk of the mare is inferior in oily matter to that of the cow, but it is said to contain more sugar, and other salts. The milk of the ewe is as rich as that of the cow in oil, but contains less sugar than that of other animals. Cheese made of ewe milk is still made in England and Scotland, but it is gradually being disused. The milk of the ass approaches that of human milk in several of its qualities. To this resemblance it owes its use by invalids in pulmonary complaints, but it has no particular virtue to recommend its preference, and is only prescribed by nurses. Goat's milk perhaps stands next to that of the cow in its qualities; it is much used in Southern Europe. It affords excellent cheese and butter, its cream being rich, and more copious than that from cows. Camel's milk is employed in China, Africa, and, in short, in all those countries where the animal flourishes. It is, however, poor in every respect, but still, being milk, it is

invaluable where butter is not to be procured. The milk of the sow resembles that of the cow, and is used at Canton and other parts of China. The milk of the buffalo is also like that of the cow, though the two animals belong to different species. Every preparation of milk, and every separate ingredient of it, is wholesome: milk, cream, butter, cheese, fresh curds, whey, skimmed milk, butter-milk, &c. Butter-milk and whey will undergo a spontaneous vinous fermentation, if kept long enough, and alcohol can be distilled from it. The Tartars, it is well known, prepare large quantities of spirituous drink from mare's milk.—*Laing's Notes of a Traveller.*

SONNET.

TO L——. CHRISTMAS.

The earth is silent, and the winter air
Sullen with snows and storms; the chill night wind
Withers with scoff and scorn whate'er behind
Lags of the faded year in woodland bare.
Of all the glorious company that there
Of flowers once flaunted, none now shine for thee:
Midway they left thee, for so friends will flee
When friends most need them. Must man, then, despair?
No! for I see through God's uncurtained sky
Openings of worlds which have no winter, night,
Sorrow, nor change! I hear the angels cry,
Like brothers, unto weary men of woe—
And weary men, where'er they are, reply—
'A child is born! to change all dark to light,
To heal the wounded, raise the weak who fall!
Glory to God on high! and peace even here below!'

M. S. J.

THE PIKE.

The pike, commonly called Jack when under three or four pounds in weight, is a well-known fish—like many of us, better known than trusted or treated. He is a greedy, unsocial, tyrannical savage, and is hated like a Bluebeard. Everybody girds at him with spear, gaff, hook, net, snare, and even with powder and shot. He has not a friend in the world. The horrible gorge hook is especially invented for the torment of his maw. Notwithstanding, he fights his way vigorously, grows into immense strength despite his many enemies, and lives longer than his greatest foe—man. His voracity is unbounded, and like the most accomplished corporate officer, he is nearly omnivorous, his palate giving the preference, however, to fish, flesh, and fowl. Dyspepsy never interferes with his digestion; and he possesses a quality that would have been valuable at La Trappe—he can fast without inconvenience for a fortnight. He can gorge himself then to beyond the gills without the slightest derangement of the stomach. He is shark and ostrich combined. His body is comely to look at; and if he could hide his head—by no means a diminished one—his green and silver vesture would attract many admirers. His intemperate habits, however, render him an object of disgust and dread. He devours his own children; but strange to say, likes better (for eating) the children of his neighbours. Heat spoils his appetite, cold sharpens it; and this very day (30th December 1846) a friend has sent me a gormandising specimen, caught by an armed gudgeon amidst the ice and snow of the Thames near Marlow. I envy the pike's constitution.—*Handbook of Angling.*

THE ELECTROTYPE.

We owe to Professor Daniell, the author of the sustaining battery, the discovery of the principle of electro-metallurgy; to Mr C. J. Jordan, the author of the earliest published account on the subject in this country, the invention of the application of that principle to practical purposes in the arts, known as the electrotype; and to Mr Thomas Spencer the earliest improvement in the means of obtaining casts by the new process. But this account only applies to England; it is undisputed that the earliest practical results were obtained by M. Jacobi of St Petersburg. *Mechanics' Magazine for June.*

A TRIP TO THE WYE AND SOUTH WALES.

WE had lately the pleasure of making a flying visit to the West of England and a portion of South Wales. Devonshire, as far as Torquay, we tried in the first place; but repelled by the humidity of the climate, we were fain to seek sunshine, and a dry atmosphere, on the green and picturesque banks of the Wye. No man who has not been in Herefordshire can be said to have seen England; but to be seen rightly, it should, if possible, be visited in May, when the blossom of its orchards, and the rich green of its meadows, present the effect of a universal garden. Not only is the country beautiful in itself, but its approaches are charming. What a fine thing is the long winding vale of Stroud, with its sprinkling of white cottages among the trees, and fields to the tops of the hills—a scene in which is happily blended manufacturing industry with rural imagery! Through this vale a branch of the Great Western carries us onward to Gloucester, where we bid adieu to the rail, and take to coach travel.

I had been several times in Gloucester previously, but had not till now an opportunity of visiting the cathedral. It is a building whose antiquity carries us back to the days of the West Saxons, and unites in its style the rounded with that of the lighter and more fanciful Norman arch. Like most of the English cathedrals, it suffered by the civil wars, and much of its finer ornamental work is irretrievably destroyed. Lately, the interior has been trimmed a little; and its monuments seem to be safe from further depredation. By far the finest thing about it is the cloisters. These form a quadrangular covered walk, entire as it was left by the pre-reformation clergy; and as such, I believe, it is unique in Britain. No archaeologist should pass through Gloucester without seeing these famed cloisters. Beneath the choir of the cathedral there is a mortuary chapel, similar to that under the cathedral of Glasgow. Here we walk in crepuscular aisles among heavy rounded pillars, shortened by the accumulation of damp earth under foot. The large and dismal vault, which admits of restoration to at least a condition of decent cleanliness, is at present employed as a receptacle for skulls, ribs, leg bones, and other fragments of mortality, thrown up from the graves in the adjoining churchyard. It is a horrible sight. For one heap, I should think there could not be fewer than twenty cart-loads of bones. The English are a curious people. What an uproar they make when a clergyman refuses to perform a funeral service at the entombment of their relations—with what indifference do they see and hear of the grubbing in graveyards, and of supra-terrestrial accumulations of mortality like the present! Perhaps the exhibition I am speaking of helps to make up the slow of the cathedral, and renders it more worthy of

the two shillings, per tariff, which our party of four had to pay for admission.

Gloucester is rising as a port for shipping, by means of a large canal, connecting it with the Bristol Channel; it is also becoming a considerable centre for railway traffic. When the railway to Hereford is completed, the upper Wye may be easily reached by tourists. To carry us westward to Ross, we procured an open chaise, and favoured by the finest weather, soon reached our destination, sixteen miles distant—intermediate country undulating and beautiful. Ross, where we remained a day, occupies a knoll on the left bank of the Wye, and with its church spire, antique gables, and one or two fancy turrets, forms a pleasing object in the landscape. The interior of the town is mean and irregular, and its lanes would make up a first-rate case for sanitarians. Alas, John Kyrle, thy good deeds, though inspiring Pope, have failed to inspire thine own townsmen! And is it not something of a shame to this prettily-situated town, with its vast capabilities for improvement and purification, that no new 'Man of Ross' should have arisen to emulate the efforts of him from whom it derives its only claim to celebrity?

At Ross, we took up our quarters at Barrett's Hotel, the situation of which, on the high ground overlooking, on the west, the windings of the Wye, it would not be easy to match: the green, sylvan country spreading away in hill and plain; the clear river beneath mirroring the blue sky and its thin feathery clouds; the lazy movements of a boat in which is a party of pleasure; the Paul-Potterish herd of cattle browsing on a meadow beyond; the villas and hamlets embosomed in trees—all compose a picture genuinely English. But still more English are the tastefully-laid-out grounds of the hotel, with their rockery, trim paths, greenhouse, patches of flowers, and commodiously-placed seats—on one of which we are enjoying the balmy evening air, and watching the great broad sun as he prepares to descend among the Welsh mountains. Adjoining these grounds is the churchyard of Ross, and by a pathway in that direction are found some pleasing walks across fields and along shady lanes—all equally English.

Down the Wye, four miles from Ross, and on the opposite side of the river, is situated Goodrich Court, the handsome seat of the late Sir Samuel Meyrick, and noted for its collection of armour and other objects of antiquity. Near it, on the top of a crag overhanging the Wye, is the ruin of Goodrich Castle, which was bombarded and destroyed during the civil wars, after a long and gallant defence by the Cavalier party. The view towards Ross from the summit of the ancient keep, to which we clambered, is one of the best points on the river. Below Goodrich, the banks of the Wye improve in picturesque beauty; and at one place they

rise into tall cliffs, richly decorated with natural foliage. From this to Monmouth is perhaps the finest part of the Wye. Following the carriage-road, and crossing the river at Monmouth to the high grounds on the south, we had some superb prospects, rendered additionally interesting from the many elegant mansions which here and there reposed in the bosom of the wooded banks. Seduced by a local guide-book, we proceeded three miles in a southerly direction from Monmouth in quest of a Druidic rocking-stone, which was said to stand on the summit of a conspicuous height in Dean Forest. Truly enough, after a pedestrian tramp to the top of a hill, escorted by a troop of juvenile lazzaroni, we reached the so-called rocking-stone, which in three minutes we discovered to be no rocking-stone at all, though sufficiently like one to form a subject of local wonder. It consists of a huge unshapely mass of a softish conglomerate, about twelve feet in height, slopingly resting, by a base of three feet, on a rock of the same material. The whole, in fact, is immovable, and but one rock, as is observable from the stratification; and the form of a rocking-stone has been given only by the abrasion of the weather. A few more winters, and the point of rest will crumble away, causing the incumbent mass to go thundering down the hill over which it impends. As the public road is beneath, we cannot admire the temerity which leaves such an engine of destruction in its present precarious position. What mythic legends and stories are told of this rocking-stone, which assuredly never rocked since the creation! Geologically, the stone is curious.

Having on a previous occasion seen the lower part of the Wye, with Tintern Abbey and Chepstow, we had no wish on the present occasion to go further down the river; and so, returning to Monmouth, we proceeded thence by the pretty vale of Crickhowel to Abergavenny and Bwlch. We were now in South Wales, and spent a few pleasant days in rambling about Brecknockshire and part of Radnorshire—country all beautiful; green hills and glittering waters; old moss-grown churches; hamlets, and villages, not over-tidy; and plenty of toll-bars, all the reformatory doings of Rebecca notwithstanding.

From Brecon, a substantial county town, with a large military barracks, we crossed the hills in a southerly direction to Merthyr-Tydvil, a distance of twenty miles. On reaching the culminating point, and dropping down into the valley of the Taff, we found ourselves in a new world. The green wooded region of Brecknockshire, with its placid life, is exchanged for bare pastoral heights and valleys, filled with the ashes, smoke, and tumult of a Pandemonium. Merthyr may be called the centre of those great iron-works in Glamorganshire and adjacent counties which threaten to alter the character of South Wales—transforming a thinly-peopled country, with primitive habits, into a species of Lancashire; a Lancashire, however, without the intellectual qualities which distinguish that scene of English industry.

Everybody is recommended to visit Merthyr for the first time at night, when its furnaces, vomiting forth fires, are seen to the best advantage. We came upon the town in daylight, but having remained over-night, and seen the place at various striking points, nothing was left for us to regret. Situated in the higher recesses of a valley, which stretches southwards to Cardiff on the Bristol Channel, there never would have been a town here but for the discovery of coal and iron in the huge bare hills from which are gathered the waters of the Taff. In an early period of British history, a Welsh prince, it seems, here erected a church to the honour of Tydvil the Martyr, and hence Merthyr-Tydvil. This edifice modernised was, till lately, the only established church in the town. Stretching up the valley from the old church, and pinched as to standing-room, the town has grown and spread till it has reached the higher uplands; the only apparent principle guiding its movements being an attrac-

tion towards the iron-works which have from time to time sprung up. Everything great in this world has had small beginnings, and so has Merthyr. Centuries ago, the adjoining hills were discovered to contain iron ore, which was dug and smelted with charcoal. This was of course done on a small scale, but not so small as to save the woods from destruction. When all the timber which adorned the mountain sides was cleared away, it was discovered that iron ore could be smelted by coal; and there, in exhaustless abundance, lay strata of this useful fossil in the same hills as the iron. Now commenced the true Iron Age. In 1755, or thereabouts, smelting was begun on a tolerably large scale; and in the present century, it has been extended so as to include four establishments—the Cyfarthfa, Plymouth, Pen-y-Darren, and Dowlais works. Taking my statistics from 'Cliff's South Wales'—one of the best local guides I have seen in England—the census return of Merthyr in 1831 was 22,083; in 1841, 34,977; and it is believed that in 1847 it was at least 45,000!—a vast population to be dependent less or more on four establishments. 'In 1847,' says the same authority, 'the place is in a state of the highest prosperity. There are now four iron-works in operation—namely, the Dowlais works of Sir J. Guest and Company, at which there are nineteen blast-furnaces; the Cyfarthfa works of Messrs Crawshaw and Sons, at which there are thirteen furnaces; the Pen-y-Darren works of Messrs Thompson and Company, at which there are six furnaces (this firm possesses two other large iron-works); and the Plymouth works of Messrs Hill, at which there are eight furnaces. There are always some furnaces out of blast. Messrs Crawshaw also possess the Hirwain works, six miles from Merthyr, at which there are four furnaces.' At Aberdare, in a valley extending from a lower part of the Taff, there were eight furnaces, and more were in course of erection.

From anything I could learn, the iron-masters are not proprietors of the hills from which they dig their ore and fuel. They are, I believe, holders of long leases of their respective tracts of country; and the expiry of these temporary holdings forms a serious social crisis in Merthyr. A short time ago, the lease of the lands held by the Dowlais Company expired; and the Marquis of Bute, as proprietor, not readily inclining to a renewal satisfactory to the other party, for some months the works were almost suspended, to the consternation and suffering of several thousand workmen and their families. At length, after a period of lamentable privation, the contracting parties came to an amicable settlement, and the intelligence of the event was hailed with the ringing of bells and other demonstrations of universal delight. What a critical state of society does this circumstance reveal! Reckoning men, women, and children, upwards of twelve thousand beings depending for their daily bread on the uninterrupted working of one establishment! Three thousand pounds paid weekly in wages by one company! Conceive all the four concerns stopped! We hope this is not a probable contingency.

With a small proportion of shopkeepers and tradesmen, Merthyr is nearly altogether a town of working people, the bulk of the houses being inhabited by persons engaged either in the mines or iron-works. It has a few police, but no corporate magistracy to exercise the usual and necessary functions of local government. Till I visited Merthyr, I had been in the belief that the Scotch were pre-eminent in dunghills; now my opinion was shaken. Not troubled with any compulsory arrangements to insure health or cleanliness, and there being to all appearance no superior intellects to project and execute schemes of improvement, the town is very badly kept, and in some of the back lanes, crowded with inhabitants, the heaps of refuse rise to enormous dimensions. But unpaved and dirty thoroughfares are not half so melancholy a spectacle as a dirty river. God has given mankind pure sparkling streams, and how much like a desecration

is the transforming of these living waters into a polluted gutter. Few rivers have so much reason to complain of misusage as the Taff. At Merthyr, where it ought to perform a useful sanitary function, it is an opaque dirty mass; and this dirtiness never leaves it till it pours, after a course of twenty miles, into the sea. Rinsings of coal and iron mines, and sundry torturings in the movement of machinery, are, it will be conjectured, the cause of this appearance. Besides these unpleasant sights, there is one more class of objects which help to destroy the picturesque in Merthyr. Up and down the vale, and crowding on the town as if about to bury it, are seen huge banks of black cinders and débris, the refuse of the furnaces and mines, locally called *tip*. Wheeled out by tramways, and continually extending its bounds, the tip is gradually covering the face of every hill and field. Green meadows and hedgerows are disappearing under the gloomy embankments; everywhere the heaps of black sterile tip wrap nature in an everlasting shroud.*

We visited, and were conducted over, the Cyfarthfa works, close to the town; and also the Dowlais works, which are situated at a distance of two miles above—nearly the whole way to the last-mentioned being lined with workmen's dwellings. The operations need no particular description. The only thing new to me was the hot-blast apparatus. Instead of cold air being blown into the furnaces, as was till lately the case, a powerful steam-engine is employed to force air into a species of oven, where, being heated to a high degree, it proceeds through pipes into the furnaces, by which greater efficacy is given to the process of smelting and working the rude masses of metal. From ore to the finished manufacture, the iron goes through several stages, the last thing done being to draw it into shape between grooved rollers. Bar iron, long rods for nails and bolts, and rails, are among the articles produced. The making of a railway rail, from the time it is a rough mass till it is drawn out and laid on the floor finished, costs only two or three minutes. Half-dressed, with begrimed perspiring faces, each handling a pair of long pincers, or toiling with long pokers in the fiercely-blazing furnaces, the men employed at these works labour with a diligence which seems to be almost supernatural. It is a dreadful struggle, too exhausting to be long sustained, and therefore relays of men shift every six or eight hours. 'The make of blast-furnaces,' says the authority already quoted, 'varies greatly, according to circumstances, and according to the quality of iron produced. Thus a furnace that will make 120 tons of forge iron, is not capable of producing more than sixty-five tons of foundry iron. The average make of pig-iron at Dowlais, where no foundry iron is made, amounts, we believe, to between 80,000 and 87,000 tons per annum; the average make of pig-iron at Cyfarthfa and Hirwain somewhat exceeds 60,000 tons.' Staffordshire and Scotch iron are imported to a small extent, to be used in some instances as a mixture. No iron is produced fit for cutlery or tools; all is of a coarse nature. At Dowlais, I was informed that the consumption of coal amounted to 1700 tons daily. Mr Cliff gives the following statement as to wages in 1847:—'Colliers earn from L.3 to L.5, 10s. per month, averaging about L.1 per week; miners earn about 18s. per week; furnace-men at the blast-furnaces, 20s. to 30s.; finers and puddlers, from 25s. to 35s.; ballers, from 20s. to 45s., averaging 30s.; rollers, from 25s. to, in a few cases, L.5, averaging to about 50s. per week. The average earnings are considerably reduced through the hill country of Glamorgan and Monmouthshires by intemperance, which leads to much loss of time.'

The larger proportion of the workmen are Welsh, and accordingly the Welsh language is generally spoken, though large numbers, here as elsewhere, speak also

English. That Welsh should still be a prevalent tongue, must be considered a serious evil. For anything I know, it may be the most ancient and copious language in the world, but it unquestionably retards the moral and social advancement of the people; and it would have been well for Wales, as it would have been for the Highlands, that its aboriginal Celtic had long ago given way before modern English. Conserved in their primitive prejudices and superstitions, the lower Welsh are with difficulty moved to adopt enlightened usages. It is amusing to hear of schools in which children are taught to repeat English lessons without understanding a word of what they are reading; but when such things are heard of in connection with the church services, they are something worse than grotesque. In a rural district where I resided for a few days, the clerk of the parish could make the responses in the service only by rote. On the late occasion of a new and special prayer being issued, he could not, after a two hours' hammering by the clergyman, be made to read or follow it; and the divine, as a last resource, induced a gentleman of the neighbourhood to undertake the office of clerk when this particular prayer came to be uttered! What would be thought in Scotland of a parish precentor not being able to read? or of a church, such as I visited in one part of the country, from the funds of which a number of clergymen draw a revenue, and which yet is honoured with a service only one day in the year? These are painful things to reflect upon; and, united with the recent evidence, as laid before parliament, on the state of morals and education in Wales, demonstrate the utter hollowness and inefficacy of the system of polity which has for centuries afflicted this fine section of the United Kingdom. The Church is said to be at length rousing from its torpor, but is it not too late? Everywhere one goes in Wales, he sees the chapels of dissenters, without whose vigilant labours, it is acknowledged, there could have been in many places no public profession of Christianity for the mass of the population. Such at least is distinctly said of Merthyr by Mr Lingen in his report respecting the town; and considering the low state of education, with the general absence of a superior class in the great seats of manufacturing industry, the wonder is, that the people behave so well as they do. The cementing element in their social state seems to be money—the receipt of weekly gains; and while this lasts, not much is to be feared. But it may be regretted that the enormous sums paid and received in and about Merthyr should come to so little good. The houses of the workmen, which generally open to the street, have a clean and neat appearance; but they are said to be overcrowded, and the family means are uneconomically expended. Much, I was told, is squandered on gay and expensive female dress for the sake of Sunday show; and the inordinate drinking of tea, purchased mostly on credit from hawkers, is described as a prevalent cause of impoverishment. In the gossiping tea meals the men do not participate; and when they return home, and find nothing to share with their family, they are 'the more ready to resort to the public-house.' On Saturdays and Sundays there is a good deal of heavy drinking, and drunken brawls are frequent. It will scarcely be credited that in Merthyr there is no savings' bank, in which the savings of the thrifty might be deposited. 'Formerly there was one, but the manager ran away, and carried L.2000 in deposits off with him; and the effect of this loss has operated very unfavourably on the people.' Why is there not a national security savings' bank in the place? or why do not the employers unite to establish and guarantee such an institution? We may, however, as pertinently ask, why the employers take so little trouble to cultivate humanising feelings in their men, and give them neither libraries nor reading-rooms? 'To provide for the education of the young, there are no schools of public institution except Sir John Guest's at Dowlais, and the National Schools at Merthyr. For the children of the men employed at the Cyfarthfa, Plymouth, and Pen-y-

* By removing the soil, and afterwards placing it on the levelled surface of the tip, might not a good purpose be served: the making, for example, of gardens for the workmen?

Darren works, no provision has hitherto been made, further than some trifling subscriptions by the proprietors to the National Schools.' When this was written by Mr Lingen, an effort, he says, was making. I did not hear that it had sensibly altered the situation of affairs. Where there are schools connected with iron works, they are supported by compulsory stoppages from the men, whether they have families or not. Besides the objectionableness of this practice, it says little for the considerate benevolence of the employers, one of whom, an absentee, I was told, makes upwards of a hundred thousand pounds annually by his works, and is reckoned as worth a couple of millions of money.

So ends my chit-chat on Merthyr-Tydvil. From this seat of energetic industry, we proceeded by railway down the vale of the Taff to Cardiff—a line of communication which offers an immediate outlet to the great iron trade of the district. Cardiff is also pretty much a creation of recent times. Until not long ago a poor Welsh town, it has arisen, under the fostering care of the late Marquis of Bute, to be a large, cheerful, and prosperous seaport. Cardiff Castle, a modern mansion built within the grounds of an ancient fortalice, may be said to form the kernel of the town; and here the late marquis died, lamented by the whole population. What this nobleman did from his own private resources exceeds in magnitude any private undertaking in the United Kingdom, the Duke of Bridgewater's canals excepted. Owning a large open moor between the town and the sea, he, with the aid of an act of parliament, caused a large portion of the land to be made into a series of wet docks, fit for the reception of vessels of all classes. These docks, extending about a mile in length, and entered by sea-gates forty-five feet wide, having a depth of seventeen feet at neap, and thirty-two feet at spring tides, present an imposing spectacle of shipping. Along one side runs the railway from Merthyr, and by this means the manufactured iron is transferred at once to the vessels which are to carry it to all parts of the world. 'The outlay in money on the whole of the works has, it is understood, exceeded £300,000; to which should be added the value of the ground, and of the lime and stone, and piles, all of which belonged to the marquis.' I could not observe without regret that between the docks and the sea there exists at low water an extensive tract of sludge, composed of the matter with which the Bristol Channel is in all its conditions charged, and through which a passage for vessels will require to be artificially maintained.

I have little farther to say regarding our excursion. From Cardiff we proceeded across a pretty piece of low-lying country to Newport, a considerable town on the Usk, where large shipments are made from the Monmouthshire iron-works. By a screw-propelled steamer, more swift than pleasant, we were carried across to Bristol in the space of less than two hours.

W. C.

A HONEYMOON IN 1848.

ONE of my friends, who had never arrived at doing anything, from having been for the last ten years in a happy state of expectation of a consulship in the East, made up his mind some time since to settle in Paris. He is yet young, and much given to day-dreams. However, though he passed for somewhat of a visionary, he was taken up seriously by a banker in that matter-of-fact region the Bourse; the worthy gentleman having ascertained that my friend Henri Delmasures had some hundreds of acres of land in Beauce and Normandy on which to build his castles in the air. He was a romantic visionary, but yet a landed proprietor. The banker, after a whole night spent in convincing himself that his daughter must be happy with such a man—a conclusion he arrived at by a process of adding, multiplying, and subtracting—consented to bestow her hand upon him.

Mademoiselle Matilda Hoffman was not merely a young lady wrapped up in bank-notes or cased in

bullion; she had, on the contrary, in the atmosphere of the three per cents., imbibed somewhat of the aerial grace of nature and poetry. The chink of the guineas had not prevented her hearing the airy voices that in every varied tone—but all soft, sweet, cheering—whisper the young heart, and fill its spring-time with delight. The dark, dull, close house in which she lived had not shut out from her all fairy visions of the

— 'Gay creatures of the element,
That in the colours of the rainbow live,
And play in the plighted clouds.'

And thus when my friend spoke to her a language not very usual before the 24th of February, till which epoch nothing was more rare than a union of hearts, it was little wonder that she listened to it, then learned to love it and him who spoke it.

The only unions taking place of late in France were marriages between rank and ready money—between position and pelf. Nor, incredible as it may seem, was this altogether to be laid to the charge of too cruelly-prudent papas and mammas; for the young ladies themselves had more than their full share of the fault. A rage for titles, or a passion for gold, possessed every heart, and had dispelled all the delightful illusions, all the bright-glowing romance of life. It is not long since I heard a young creature, who had scarcely seen seventeen times the budding of the hawthorn, say in confidence to a friend, 'I will marry no man that is not either a nobleman or a stockbroker;' while the friend on her part reciprocated the trust reposed in her by a whispered determination 'never to marry any one but a prince or a banker.' But Matilda Hoffman troubled not herself either about the titles her Henri had not, or the money that he had: she was in love, just as the young were wont to be in the Golden Age. She was delighted to find that he did nothing, could do nothing, and wanted to do nothing. 'At all events,' she said to herself, 'he will not immure me in a bank; and we can go where we like, free to love and live for each other.'

It is but due to my friend Delmasures to say that he was quite ready to live for her. Matilda Hoffman had suddenly shone out upon him as the visible image of his beau-ideal of grace, goodness, and loveliness—as his taste personified. The matter was soon settled, and the marriage fixed to take place on the 24th of February.

On the evening of the 23d, after repeated calls, we at length succeeded in finding the mayor at home. Whilst the young lady was signing the necessary documents, the functionary entertained her with a lecture on politics and morality. He did not find it a very difficult matter to prove to her satisfaction that a government which thus sanctioned love by marriage was the best of all possible governments, in the best of all possible worlds, and might defy any attempt to subvert it. On leaving the mayoralty-house, however, neither M. Hoffman, the bridegroom, nor the witnesses, could find their carriages. Whilst the mayor, in all the loyalty of his tricoloured scarf, had been proving that there was nothing serious in this ebullition of boys and sucking children, the heroic and patriotic *gamins* had seized upon every hackney-coach, cab, omnibus, and other vehicle to make barricades.

That night Matilda passed alone in prayer for the dying. The next day at eleven o'clock Henri Delmasures presented himself at the banker's in the dress of the evening before, which it was evident he had not taken off all night, but with the addition of sabre and pistol, and no small quantity of mud.

'But, my dear friend,' said the banker, without raising his eyes from three or four newspapers he held in his hand; 'my dear friend, we cannot marry to-day.'

'Not marry to-day! Who says so?'

'Do you not know what has happened? The people have been making barricades. M. Molé succeeds M. Guizot; M. Thiers succeeds M. Molé; M. Odillon Barrot is in place of—I forget whom—but no matter—the

people will soon be in everybody's place. Just glance at these papers: really some of the predictions are quite terrifying.'

'Not an instant is to be lost!' exclaimed Henri. 'Where is Matilda?'

He hurried to the young lady's room, and found her in her wedding-dress. 'My own Matilda, how lovely you are looking! But we must hasten to church, for in one hour it might perhaps be too late. You must not leave me longer in this revolutionary torrent that is carrying all Paris away. See, I have been fighting hard—were I not modest, I would say as hard as a *gamin*. To-morrow the republic—but to-day love!'

The terrified girl threw herself into the arms of her Henri. 'In mercy take me hence; far from the world if you will; but anywhere from hence!'

'But, my love, you must change this dress. We shall have to make our way to the church over the barricades.'

Before an hour had elapsed, the curé of the parish had pronounced the nuptial benediction in a small chapel, the humble walls of which were wont to witness only the plighted vows of those who had no wealth save their strong arms and true hearts.

'Now,' said Henri to Matilda, 'let us leave your father to finish his discussion with the curé on the present state of affairs, and let us fly to some steam-carriage that, swifter than the wind, will take us somewhere—I care not whither, provided it be to a country where we can peacefully enjoy our honeymoon.'

'Suppose we take the railway to Rouen? Well do I remember in the woods there an old château; it was enchanting, dear Henri. I spent six weeks there last summer wandering in its groves, with no one to speak to but the trees. I am only afraid it is too near Paris: let us go to the other end of the world.'

Henri and Matilda were soon on their way to Rouen, at the full speed of a train baptised that very morning 'the Republic,' and through the window of their carriage they were witnesses of the general flight attesting 'the magnificent national co-operation that had accepted the new institutions,' and the sincerity of the adhesions to the republic, and evincing the universal confidence in the proclamations that order, liberty, and equality had been established. 'Hurrah! the dead can ride apace,' says the poet Bürger; but fallen courtiers can ride still faster. 'Only look,' said Matilda, 'at that servant in livery galloping so furiously, that I should not wonder at his outstripping us. Do you see him?'

'I see him,' answered Henri: 'it is one of the ex-ministers.'

'And that poor young woman who is dragging her feet so slowly along the rough road, and from time to time looking back with such a terrified air?'

'I see her,' replied Henri: 'she is a princess.'

Thus they beheld pass along before them all that, for nearly twenty years, had been the court and the administration. A dark page of history was unrolled upon the high road—the last unfinished story of kings and queens—'Once upon a time.'

Journeying in this way, the two lovers arrived at Havre. While strolling on the sea-shore in the evening, they perceived an old gentleman hurriedly making his way towards a steamer a little apart from the rest of the shipping. Henri and Matilda paused to observe him. It was the Monarchy leaving the soil of France; and the most determined republican would scarcely have chided the respectful salutation of the young pair—the respect of pity.

But they gave up an intention they had formed of going to London. Was it from reluctance to follow in the track of the fugitive monarch, to come in contact with the hoary head from which a crown had so lately fallen? Or was it the fear that the ex-king might carry about with him, however involuntarily, the seeds of a successful revolution? Perhaps each of these reasons had some influence in changing their route. Neither would they venture to Brussels, for reports had reached

them, whether true or false, of a new edition of a revolution there as well as in Holland, where the people were demanding a little, and the king granting a great deal.

However, as go somewhere they must, they went to Switzerland—the classic land of honeymoons. 'Switzerland being already a republic,' said they to themselves, 'we need not be afraid of its wanting to make itself one.' In the confidence of this hope, Henri and Matilda rented a chalet by the side of a mountain, where they might place themselves and their love under the protection of the Landamann and the old Helvetic Confederacy. But they were hardly on their way to it, after a short stroll by the side of the lake, when they perceived a band of armed nationalists wheeling about them. It was at Neufchâtel.

They now turned their thoughts to Germany. 'Let us go to Germany,' said they. 'There no one troubles himself about anything but waltzing or metaphysics.' They set out, but they were scarcely half-way, when they were warned, 'Do not go to Vienna; do not go to Berlin.'

As their carriage was about to cross a bridge, a female equestrian, with her hair floating over her shoulders, and her long graceful velvet drapery falling over her Arab horse, yet withal of a martial air that might have become the queen of the Amazons, galloped up so suddenly to them, and threw herself so directly in their way, that the postilion had scarcely time to pull up the leaders. 'Back there!' she cried, as she presented in his face a little pocket-pistol.

The terrified postilion fell back upon the horse he was riding, while Henri, putting his head out of the carriage-window, recognised in the desperate Amazon the Countess de Landsfeld.

'Madame,' he said with a courteous smile, 'I beg to assure you that we are neither Prussian gendarmes nor Bavarian municipal guards. Have the goodness, then, to reserve your powder and ball for some greater political emergency, and allow us to pursue our route.'

Lola Montès broke into a merry laugh, which made the mountains ring with its echo. They were like old courtiers, but a little more genuine—perhaps the last courtiers.

'Take good advice,' said she, 'wherever you get it. Go not to Germany: they have burned my hotel.'

So saying, the Countess de Landsfeld set off like an arrow from the bow, leaving Henri and Matilda to exchange glances of surprise, and to ask each other, in utter despondence, whither they were now to bend their steps—what country would receive them? 'Let us go straight forward,' at last they cried. And straight forward they went, through woods, and meadows, and ravines, till the Rhine became the splendid barrier to further progress, unless they committed themselves to its waters. They did so, and stopped not till they came to Johannisberg, where they met an old man seated in an arbour, with his bottle and glass before him.

It was M. de Metternich, who was drinking his last bottle of Johannisberg.

'Your excellency,' said Henri, respectfully saluting—the bottle—'your excellency will pardon me if, in presuming to address you, I derange the balance of power in Europe; but we are a young couple from France, who are in search of some pretty little cottage where we may give a few short weeks to each other. Your excellency—who knows all news better than any telegraph, any newspaper—will have the goodness to tell us whether there are any cottages in Germany?'

The diplomatic eye of M. Metternich flashed somewhat angrily; but seeing nothing but artless simplicity in the faces of the young couple, he filled a fresh bumper, tossed it off, and buried his face in his hands.

'My Lord Minister,' said Matilda timidly.

'I am no longer minister,' answered he.

'My Lord Prince,' stammered Henri.

'There are no more princes.'

'Well, my Lord of Austria.'

M. de Metternich raised his head, looking sad as a German ballad.

'Austria is no more,' said he in a gloomy whisper. 'Austrians have destroyed it in destroying me. Diplomacy is no more, for I am the last diplomatist; and I!— Oh, Talleyrand, thou hast done well to die! The great art of working the hinges upon which all politics turn is at an end for ever. The people break the hinges when they cannot open them, and the axe is a hammer that opens every lock. We have fallen upon evil times, when words are of no other use to statesmen than to express their thoughts, and that even when perhaps they have none to express. Pity me then; behold me reduced to swallowing my last refuge of diplomacy—that is to say, my Johannisberg wine, that wondrous beverage with which I have mystified all Europe for more than sixty years.'

And M. de Metternich was silent, having nothing more to drink or to say.

I now lost all trace of Henri and Matilda for some time, but rested satisfied that they had at length found the promised land, when this evening I received the following letter:—

'BRESCIA, March 19.

MY DEAR FRIEND—We have at length arrived in Italy, after having passed through twenty countries all in revolution. Up to this moment we have not had an hour's quiet, for wherever we turned, there burst the revolutionary waterspout. Whatever shore we reached, the waves broke in upon it, and drove us before them. We have been at Brescia about half an hour, and must leave it before the hour is over. We were afraid of Vienna—afraid of Milan. "No strangers!" was the cry there; and though I knew they meant the Austrians, yet I was not certain how far they might carry their nationality. We knew that Rome was celebrating a constitutional carnival; that Florence's Grand Duke was proclaiming constitutions; that Naples had a king to-day, and will have to-morrow a Masaniello. We thought of Monaco, but it appears a republic is proclaiming there. The republic of St Marine next occurred to us, but there they are seriously talking of proclaiming an emperor. A prophetic hurrah has reached us from the Don Cossacks. Asia has turned her eyes westward, and drawn the sword against the Emperor of all the Cossacks. Every day we see the moon rising, it appears to us under every form, and in every colour. I suppose you have it tricoloured in Paris? But it is not the honeymoon: alas! we know not where to find that! To what shore, favoured of Heaven, are we now to steer our frail bark of love, launched into the open sea in such stormy weather? We had joyfully cried out "land!" when we reached Brescia. Here in the fair fields of Lombardy, where spring has already come with her hands full of opening flowers and verdant foliage, we hope to forget the world and its revolutions; but hardly had we alighted from the diligence, than a huge creature, one of the rabble, collared me, and demanded if I were not the viceroy; for the report had been already spread that the viceroy, driven from Milan, was on his way to Brescia, which he believed to be friendly to him.

"My worthy friend," said I, "you really wrong me. I have just come from a country where the very word royal is erased from the dictionary." Apropos of the dictionary, have you still an Academy? By this time the diligence was surrounded by a crowd, not less demonstrative in its greetings than my first friend. I commenced a parley with them, interrupted from time to time by a poor nervous Englishwoman, white as her country's cliffs, protesting that though she did come from Munich, she was not Lola Montès. In a few minutes, however, a diversion was effected in our favour by the arrival of a second carriage. The mob rushed towards it, and seizing upon a man who alighted from it, dragged him into the next square. They say it is the viceroy: I am not sure; but one thing is certain,

that the revolution is here as well as everywhere else. Danton said "that we did not carry our country about with us on the soles of our shoes;" but methinks I must carry about with me dust pregnant with revolutions.

'At length, in utter despair, I thought of Ireland. "I have heard of no revolution in Ireland." "If not," answered Matilda, "then we must not go; a revolution there would imply quiet, for it implies change, and the usual natural state of that country is disturbance."

'Her woman's wit at last suggested, "Why not go back whence we came?" She is quite right. Will you, then, have the goodness to call at my house and tell my English servant—but I was forgetting that the cause of liberty, equality, and fraternity would be compromised by my retaining him in my service—but tell any of my people you can find that we are on our way to Paris, and hope to spend our honeymoon at home?'

'Farewell. I have but time to add, health and fraternity,
HENRI DELMASURES.'

BISSET THE ANIMAL TRAINER.

STERNE says it is easy to travel from Dan to Beersheba, and cry 'All is barren.' It is equally easy to glance at the capabilities of the brute creation, and cry 'All is instinct.' But what this instinct is, and what affinity it bears to man's boasted prerogative of reason, are questions of a graver character—questions which have demanded and received the attention of some of the wisest of our race; but which have as yet received, and are perhaps at present capable of receiving, only vague and unsatisfactory replies.

The actions of many animals, and even of insects, frequently exhibit an appearance of forethought and knowledge which may well excite our surprise. A remarkable instance of this appears in the construction of the honeycomb, which is formed, in every respect, on the most approved mathematical principles. The bottom of a cell must be composed either of one plane, perpendicular to the side partitions, or of several planes meeting in a solid angle in the middle point; otherwise the cells could not be similar without loss of room. For the same reason the planes, if more than one, must be three, and no more; and by making the bottom to consist of three planes meeting in a point, much material and labour is saved. The bees follow these rules with as much accuracy as if they had been regular students in geometry. Dr Reid, in the course of some perspicuous observations on this subject, observes—'It is a curious mathematical problem at what precise angle the three planes at the bottom of a cell ought to meet, to make the greatest saving in material and labour. It is one of those problems belonging to the higher parts of mathematics, called problems of maxima and minima. The celebrated M'Laurin resolved it by a fluxionary calculation, to be found in the Transactions of the Royal Society of London, and determined precisely the angle required. Upon the most exact mensuration which the subject could admit, he afterwards found that it is the very angle in which the three planes in the bottom of the cell of a honeycomb actually meet.' Though we apprehend there are few who would be disposed to dispute the doctor's pious and elegant remark, that 'the geometry is not in the bee, but in the Great Geometrician who made the bee,' it is a subject which, taken in connection with the many similar instances of skill and knowledge which meet us at every turn, is not only of deep interest in itself, but well worthy of the most searching investigation which our powers will enable us to give it.

But there is something beyond this. It is sufficiently remarkable, and not too complimentary to our mental supremacy, that a philosopher of eminence, in solving a mathematical problem of acknowledged difficulty, should find that he had but discovered a principle which such an insect as the bee had long known and acted upon. But however surprising the acquisition of such know-

ledge may be, it is the common property of the race. All honeycombs are constructed on the same principle, and the latest structure boasts no superiority over those formed centuries ago. Thus, however astonishing the original acquirement, there is no power of progression manifested. No Christopher Wren or Inigo Jones has arisen among the bees to breathe over the cells an atmosphere of taste and elegance, and teach the plastic wax to assume hitherto unknown forms of grace and beauty. From this absence of improvement, many philosophers have attempted to draw the line at this point between instinct and reason. Smellie, in his 'Philosophy of Natural History,' says instinct should be limited to such actions as every individual of a species exerts, without the aid either of experience or imitation; and in accordance with the same views, Dr Gleig, in the 'Encyclopædia Britannica,' observes, that no faculty which is capable of improvement by observation and experience can with propriety be termed instinct. If we accept this view of the subject, it seems doubtful whether we are not compelled to allow the animal creation the possession of another faculty in addition to, and above, this supposed boundary of their intellectual nature. For though Smellie speaks of the improvement of instinct, the doctor very consistently remarks, that to talk of such a thing 'is to perplex the understanding by a perversion of language.' And yet it is a fact, as remarkable as interesting, that the faculties of animals are capable of such improvement; and that this capability is not confined to the higher species, but extends downwards to those grades which had hitherto been considered as quite beyond the pale of civilisation. Of this we have had such abundant testimony, that almost every man's experience can supply him with the proof. Not only have the wild denizens of the woods been brought by Van Amburgh and others to a surprising state of docility and acquired knowledge, and the king of the forest been taught to leap through a hoop, the elephant to make as dexterous a use of his trunk as a *chevalier d'industrie* does of his fingers, and several of the nobler animals to sustain their parts with credit in the performance of a regular drama; but some of the very lowest classes have developed, in the process of teaching, such latent powers and capabilities, as not merely to excite our present wonder, but seem to warrant the conclusion, that as we increase the skillfulness of our training, these developments will be found to increase with it. We do not think that the philosophy of this part of the subject, considered apart, and as distinct from the ordinary manifestations of instinct, has hitherto met with the attention which it deserves. We cannot, however, with any degree of justice, make the same complaint of the teaching itself; for the number of practical professors has so increased of late years, that an exhibition of trained animals which, a century and a half ago, would have been considered as occupying 'the debateable land' somewhere on the road between cheating and sorcery, is now almost as essential a part of every country fair as those dear old associates of our childhood—the wonderful puppet-show, with its men something larger than trees, and its skies something deeper than thumb-blue, and the venerable but ever fresh, mirthful, and delightfully-ridiculous Punch and Judy.

Among those who have directed their attention to the training of animals, there are few who have evinced more aptitude for the task, have prosecuted it with more ingenuity and patience, or produced more successful results from their labours, than a man of the name of Bisset, who was well known in London, and indeed in most parts of the kingdom, about the middle of the last century. We are not sure that we can claim for him the title of the father of the art; but it had certainly attracted little attention in this country before his surprising exhibitions gave it an *éclat* which it has never since lost, and which has now made it a regular branch of study among those who cater for the amusement of the public. Bisset was born in Perth about the year 1721, and brought up to the trade of a shoemaker.

Possessing that kind of talent which forms what is usually called 'a clever man,' he soon became noted as a skilful workman in the neater branches of the trade, particularly in what is technically called 'women's work,' and as Perth did not offer the encouragement to which he now naturally looked forward, he removed to London, where he not only found a wider field for the exercise of his abilities, but was enabled to push his fortune in another and more tender way, by becoming acquainted with a young woman of property, whom he soon afterwards married. This addition to his worldly means enlarged his views for the future: he established himself as a broker, was successful in his new business, and in a fair way for quietly accumulating a competence for the comfort of his old age, and then dying with only his 'grandchildren's love for epitaph,' when a chance circumstance gave a new current to his ideas, or at least changed the even tenor of his way. In the year 1739, he accidentally read in the newspapers an account of some surprising feats of a horse exhibited at the fair of St Germain's; this seems to have awakened in him a spirit of emulation, and he determined to see what he could achieve in the same way. It is scarcely probable that this circumstance drew his attention to animal teaching for the first time: such an incident, like many extraordinary accounts in our own day, might have made a transient impression, but would scarcely have produced such immediate results. It seems more likely that an early partiality for animals had caused him to feel an interest in their habits and modes of action, which led to a more attentive observance of them than is ordinarily paid. The nature of his early occupation, while it employed his hands, had allowed full leisure to his thoughts; and these thoughts were no doubt often engaged upon instances of brute capability which he had casually observed, and sometimes, perhaps, upon the means of further developing that capability by tuition. However this may be, the account, if it did not first cause him to think, certainly first induced him to act; and he immediately began those experiments which have placed his name so high on the list of animal teachers. The first objects upon which he tested his powers were a horse and a dog; with which his success was so decided, as to strengthen the belief that his system of training was no sudden and immature impulse, but the result of close thought and patient observation. This success encouraged him to extend his experiments; and for his next pupils he selected two monkeys, which he trained to the performance of a regular exhibition; one of them going through a good imitation of biped dancing, and tumbling on the tight-rope, while his companion held a lighted candle in one paw, and played a barrel organ with the other. As these feats began to attract attention, and draw considerable audiences to witness them, he resolved to pursue his system on a more extended scale; and the result was equally creditable to his ingenuity and his patience. Having procured three young cats, he contrived to teach them not only so to strike the dulcimer with their paws as to produce a regular tune, but to add their 'most sweet voices' to the concert, singing first, second, and third, in the regular way. This performance was sufficiently striking in itself, and doubly so at a time when such things were strange. We who live in an age when even fleas are 'industrious'—that is, apart from, and over and above, their usual vampire vocation—when cats turn coachmen to doves, and birds die and revive again at bidding; when mice are dressed as ladies, and go to bed with lighted candles; and monkeys remind us of the enchanted prince in the 'Arabian Nights,' we have been too much accustomed to these things for them to inspire us with any vivid interest; but in that day, when they possessed all the charm of novelty, their exhibition drew such crowds, that Bisset was induced to transfer the performance from his own house to the Haymarket Theatre. There his feline protégés made 'their first appearance on any stage' in the famous *Cats'*

Opera—a piece which, from its novel nature and interesting character, as an evidence that the brute creation possessed capabilities hitherto not only undeveloped, but undreamt of, brought such overwhelming audiences to the theatre, that in a very few days the fortunate *maestro* saw himself the possessor of nearly a thousand pounds. He now resolved to convince the world that however wonderful they considered it that such effects could be wrought on animals hitherto deemed to rank low in the scale of rationality, there was still 'in the lowest depth a lower deep,' from which equal food for astonishment might be drawn. He taught a leveret to bear its part in the singular concert, by beating on a drum with its hinder feet, and to play several marches in the same way. At subsequent exhibitions, sparrows, linnets, and canaries, spelt the names of the company, told the hour and minute of the day, and performed other feats of a similar nature; and as a crowning specimen of his power over the inferior races, he trained six turkeys to go through a regular dance; and one to fetch and carry like a dog, and, with blackened claws on a chalked board, to trace out the name of any person present that was placed before it. The means by which he contrived to accomplish such surprising ends, not merely with animals of recognised sagacity, but with creatures which had been deemed incapable of exhibiting a ray of intelligence, were of course known only to himself; and as the results appeared to warrant the presumption that he had found the golden key to the coffers of prosperity, he was naturally not anxious to peril his expectations by unlocking 'the secrets of the prison-house.' But though it is to be feared that, had his system of instruction been disclosed, it would not have been found to accord with the dictates of humanity—for he confessed that he had taught the poor turkeys on the Eastern method, by heating the floor beneath them—there is still much left for the results of ingenuity and patience, and much more for the existence of a capacity in the animals themselves, hitherto unsuspected, and perhaps even now capable of higher development under improved means.

Bisset's own labours in the field, however, now received a premature check. He had gone on for some time reaping his golden harvest, and no doubt calculating that the same seed would always produce the same fruit. But the simple-hearted shoemaker had yet to learn the instability of the popular mind. The novel character of his early exhibitions had caught the attention of the town; they became the rage, and every one was eager to witness them: this zest had now begun to cool; the votaries of fashion had set up some other idol; and poor Bisset had the mortification to see the benches, which had once scarcely sufficed to accommodate the crowds that eagerly thronged to fill them, now gradually grow thinner and thinner. His exhibitions were more carefully got up than ever, and varied by every means which he possessed; but all would not do: the public curiosity was satisfied, and they would no longer draw. Bisset did not find the expense of his establishment decrease in the same ratio as its magnetic powers, and saw his guineas melt away like snow in the sunbeam, till he was at last compelled to dispose of a portion of his long-cherished animals, and descend to an itinerant exhibition of the rest. Even this resource seems to have been only partially successful; for we find him in 1775 abandoning London altogether, and travelling through a portion of the north of England; till at length, finding it impossible to rekindle the extinguished embers of excitement, he resolved upon a totally opposite course of life—by exchanging a profession whose aim was to raise the brute as near as might be to the level of the man, for one which too often debases the man to the level of the brute. He opened a public-house at Belfast, and for some time seemed not to have an idea beyond licensed victualling. But the habits of years are not to be eradicated in a moment: the old tree is not to be drawn out of the earth like the plant of yesterday. It was not long

before he possessed a dog and cat, whose feats did as much honour to his powers of teaching as those of their predecessors; and being put upon his mettle by the assertion that, however successful with more docile animals, he would never be able to overcome the obstinacy of a pig, he immediately purchased a small black suckling for three shillings in Belfast market; and training it to lie under the kit whereon he again plied his original trade, he bent his energies to this new and more difficult experiment with all the zest which a huntsman feels when he knows he is on the track of an old fox. For seven months, every means which ingenuity or experience could suggest were tried, and tried in vain: the brain of the pig seemed incapable of containing any idea beyond that of wash; and he was on the point of relinquishing the experiment as hopeless, when a fresh method of teaching happened to strike him. Unwilling to acknowledge himself baffled, he put it in practice; and with such a triumphant result, that at the end of another six months his pupil was on the high road for becoming what is not unfamiliar to us in the present day, but was then, we believe, an unheard-of wonder—a learned pig.

The hope of 'driving his pig to a good market'—the force of old habits—and perhaps the astonishment expressed at his success, and a little pardonable vanity in being able to show the world, which had neglected him, his ability to instruct and control an animal whose stupidity has long been an axiom, and whose obstinacy has passed into a proverb, succeeded in tempting him once more from his trade; and we find him in Dublin, in August 1783, exhibiting his pig at Ranelagh. His triumph over its native stubbornness had been complete; and besides manifesting a degree of docility and obedience more characteristic of a spaniel than its own species, it is recorded that it would cast up accounts with accuracy, spell the names of persons present without any apparent direction, point out the words they thought of, distinguish the married from the single, and kneel and make obeisance to the company at the close of the exhibition. These performances, which, after allowing for the usual charlatanism of such exhibitions, were still highly surprising, began to create what the newspapers call 'a sensation.' Some of the old tide of prosperity began to flow back; and Bisset already saw, in anticipation, the return of at least a portion of those guineas which had formerly weighed down his purse-strings. These expectations were strengthened when, on the weather's rendering it necessary that he should remove the animal into the city, and having procured the chief magistrate's permission, he advertised it for exhibition in Dame Street, many persons of distinction honoured him with their presence, and the applauses bestowed on his skill and patience were of the most flattering character. This event, however seemingly so auspicious, proved a fatal one for poor Bisset; for he had not occupied the room many days, when an officer—evidently one of those who consider that even 'a little brief authority' is worth nothing unless made the most of—broke into the apartment, under the pretext of its being an unlicensed exhibition, wantonly destroyed the apparatus which directed the performance, and loaded with coarse abuse the inoffensive proprietor himself, who in vain pleaded the magisterial permission as a sufficient sanction for his presence. A threat of a prison and the loss of his pig, if he dared to repeat the exhibition, was the only answer to his mild remonstrances; and the dread of the fulfilment of the menace, together with the destruction of his property, so terrified the poor man, that he lost no time in quitting a place where his hopes had been a second time so lamentably disappointed. He had scarcely regained his home, when the agitation of his mind, acting on a weak and enfeebled body, threw him into a fit of illness, which, in effect, brought both his interesting labours and personal anxieties to a premature close. For although he partially rallied, and being pronounced able to travel, had resolved to return to London, the scene of his early triumphs and his tran-

sient prosperity, a relapse of his illness overtook him at Chester, and a few days saw his quiet and harmless spirit removed to another world.

SNEEZING.

Among the many enchanting tales of the 'Arabian Nights,' in which our youthful fancy of old luxuriated, we remember there was one of a certain humpbacked school-master, who gives the history of his unfortunate deformity. Among the various valuable precepts which he inculcated, those of politeness seem to have held a chief place; and when he sneezed, we are told the scholars were taught to clap their hands, and exclaim 'Long live our noble master!' One day the dominie and his pupils were walking in the country: the day was sultry, and they were all glad when at last they fell in with a well. But, if we remember aright, the bucket was at the bottom, and the worthy dominie resolved to descend and bring it up full. Having filled the bucket with the 'crystal treasure,' the master gave the word, and the youths forthwith commenced hauling him up again. When near the top, as ill luck would have it, their preceptor sneezed! Simultaneously the boys let go, and, clapping their hands, vociferated the accustomed 'Long live our noble master!' while the luckless dominie, bucket and all, went rattling down to the bottom again—breaking at once his back and many of his prejudices in favour of etiquette.

When this tale first met our youthful eye, little reflective though we were, sneezing we thought was an odd thing to make the subject of compliment. But the discoveries of our maturer years have sufficiently proved how very ignorant we must have been to come to any such conclusion. Jewish rabbi and Christian pope—Arab novelist and classic author—the sands of Africa, even the savannas of the new world—all furnish proofs of the high importance attached to the sternutative functions. Records of this are found in all countries and in all times—except the antediluvian.

And this brings us at once into contact with the Jewish rabbis—those extraordinary fellows, who seem to have been better acquainted with Eden than ever were Adam and Eve—who know all the secrets of the Ark, and would beat Noah himself at an inventory of its furniture. Such extensive chronological attainments must be invaluable in searching out the origin of things; and we are glad we can derive the early history of sneezing from authorities so unimpeachable. As there is no mention in the Sacred Writings of illness among men until some time after the Flood, the rabbis declare that sickness was altogether unknown in the early world. How, then, it may be asked, did men die in those days? Why, they just sneezed, and expired. So say the rabbis. They tell us, moreover, that Jacob, disrelishing this speedy exit from life, earnestly desired that some warning should be given in order to prepare for the momentous change. This, say the rabbis, was the object for which he wrestled with the angel. His prayer was granted: he sneezed, and fell sick. The hitherto unheard-of circumstance of a man sneezing, and yet surviving, must, on the supposition of the rabbis, have made a great sensation among mankind: still more would the advent of disease—and thus associated, sneezing thenceforth ranked as one of the most important phenomena of the human system.

So much for tradition. But mythology also pays a like homage to this 'wind of the head.' Sneezing is said to have been the first act of the first man made by Prometheus. After giving the last finish to his work, Prometheus, we are told, cudgelled his brains as to how he

was to impart to it life and motion. The difficulty, however, was found to be a poser: he needed celestial aid to accomplish his purpose. Accordingly, conducted by the goddess Minerva, he skimmed lightly through the regions of several planets, and at last approached the sun. This was the stuff he wanted. Concealed under the mantle of his divine guide, Prometheus neared the resplendent orb, and filled with its liquid fire a phial which he had brought for that purpose, hermetically sealed it, and forthwith regained earth sound in limb and overjoyed in spirit. Applying the flask to the nostrils of his statue, he opened it, and instantaneously the subtle sunbeams insinuated themselves with such power through the pores of the spongy bone that the image sneezed. Upon this impulse the living principle was diffused through the brain, the nerves, the arteries—and the image stood forth as good a man as its manufacturer. It is added that Prometheus, overjoyed at the success of his experiment, broke into words of benediction and of prayer for the preservation of the wondrous work of his hands; and that this first man, awakening into consciousness while the words were being spoken, ever afterwards remembered them; and on every instance of sternutation in himself or his descendants, imitated the example of his artificer.

It was thus that the poets of Greece and Rome endeavoured to account for the existence of the wide-spread custom of saluting any one who sneezed; but the monks of the middle ages have not been behind-hand with them in the attempt. According to their legends, in the days of St Gregory the Great there reigned a deadly poison in the air of Italy, so that any one who sneezed or yawned instantly fell dead; and in consequence of the great mortality, the Pope ordained that on all occasions when a yawn or sneeze occurred, the bystanders should repeat certain words of prayer, to avert danger from the luckless wight who had been seduced into so perilous an indulgence. But in this case the heathens have undeniably the advantage over mother church: in regard to truth, we believe they are pretty much on a par; but for the children of the Vatican to attribute to the sixth century the origin of what had existed for a thousand years before, is ignorance 'beyond all hooping.'

The custom was of long standing even in the days of Alexander the Great, whose preceptor Aristotle made it the subject of erudite remark. In all countries the spirit of the salutation was the same—from the terse '*Salve!*' of the Romans, to the rather Irish Orientalism, 'May you live a thousand years, and never die!' and among the Greeks and Jews the very word was identical—'*Live!*' The Greeks have a capital story in one of their comedies of an old fellow called Proclus, who had a nose so very big that he could not blow it, as by no possibility could his hands reach to the end of his nasal protuberance; and to give posterity a still better idea of this formidable proboscis, the Greek dramatist adds, that when this Mr Proclus sneezed, he could not even cry 'God help me!' as the nose was too far off for the ear to hear.

But far from being confined to classic ground and the realms of Asia, the practice existed even in the depths of barbarous Africa. Old accounts of Monomopata testify that whenever the king of that region sneezed, all those who were in the place of his residence, or even in the environs, were simultaneously apprised of it, either by signs, or certain forms of prayer made on his behalf, which instantly spread the intelligence from the palace to the city, and thence to the suburbs; so that nothing was heard around but devout wishes for the prince's health, and a kind of 'God save the king!' which every one was obliged to repeat aloud. More extraordinary still, this piece of etiquette was witnessed by the Spaniards among the natives of the new world. The author of the 'History of the Conquest of Florida' informs us that the cazique of Guachoia having sneezed in the presence of Soto, all the Indians present immediately bowed low before their prince, venting aspirations that the sun would preserve him, enlighten him, and be always with him.

A custom so singular and so universal could not fail

to attract the notice of ancient writers, who have endeavoured to deduce its origin from natural religion. The head, they said, is the principal part of man: it is the fountain of the nerves, of all the sensations—it is the dwelling-place of the soul, that divine particle which thence, as from its throne, governs the whole mass—that hence a peculiar dignity always attached to it, and men in early times used to swear by their head as by something sacred—that they never dared to taste or touch any kind of brain—that they even avoided naming the word, usually expressing it by a periphrasis, such as 'white marrow.' From all this, it is added, it is not strange that their descendants should continue to reverence the brain, and attach importance to sneezing, which is its most visible manifestation.

As the ancients cannot now defend themselves, it would be ungenerous to make disparaging remarks on this theory of theirs; so we will rather pursue our theme, and find the sternutative function, in unholy wedlock with superstition, playing the part of an influential, but on the whole very harmless, familiar spirit. Greeks, Romans, Egyptians, all listened to its 'warning trumpet' as to the voice of a present deity; and there are on record endless instances in which a sneeze has determined an embarrassed heathen in his line of conduct. One day, for instance, Xenophon was haranguing his troops, and just as he was impetuously exhorting them to adopt a hazardous, but in his view indispensable resolution, a soldier sneezed: spontaneously, says the historian, the whole army adored the deity; and Xenophon, skilfully profiting by the incident, wound up by proposing a sacrifice to the 'saviour god' who had thus counselled them to adopt the salutary plans of their general. In Homer, likewise, when Penelope, harassed by the importunities of her suitors, is venting imprecations against them, and breathing wishes for the return of her Ulysses, her son Telemachus interrupts her with a sneeze so loud, that it shakes the whole house: Penelope gives way to transports of joy, and sees in this incident an assurance of the speedy return of her long-absent husband. Even the wondrous demon of Socrates, which the sage so often consulted in the exigencies of his eventful life, was neither sylph nor salamander, if we are to trust a passage in Plutarch—neither genii nor conscience—it was a sneeze!

It is true there is something rather anti-romantic in a sneeze; yet in olden times, when Venus was still queen of beauty and love, a gallant would often not have exchanged the sound of its rasping blast for the softest breathings of Zephyr, or the sweetest song of the nightingale. Indeed, in the ever-swiftest world of love—of all others the brightest, yet most troubled—this omen was regarded as the weightiest and happiest of all. Parthenis, a young Greek girl, who has rather foolishly allowed herself to get head and ears in love with a youth, after many sore struggles, and long irresolutions, resolves to write an avowal of her passion to her dear Sarpedon. Let us follow her to her bower or her boudoir. There she sits, the loving, foolish creature! with as heavy and anxious a heart as ever belonged to a sweet girl of sixteen. The gentle murmurs of the *Ægean* come floating into the room; and as she looks up, the evening sunlight falls cheerily on her pale cheek as it quivers through the vine trellis. Her eye is brimming, and her heart flutters as she resumes her stylus; for now she is at the very crisis of her letter, and is avowing her passion with guileless ardour, when a light, rapid convulsion shakes the stylus from her grasp. She has sneezed! It is enough! Parthenis is once more all joy: for she knows that at the same instant Sarpedon is thinking of her with sentiments as loving as her own. The heathen divinities themselves seem to have sneezed when more than usually pleased, and inclined to be beneficent; and the poets used to say of persons remarkably beautiful, that 'the Loves had sneezed at their birth.' Cupid appears to have been especially fond of thus testifying his approbation, as we learn from the sweet little poem of Acme and Septimellus, from which the following lines are translated:—

'Acme then her head reflecting,
Kissed her sweet youth's ebriate eyes,
With her rosy lips connecting
Looks that glistened with replies.
"Thus, my life, my Septimellus!
Serve we Love, our only master!
One warm love-flood seems to thrill us,
Throbs it not in me the faster?"
She said: and, as before,
Love on the left hand aptly sneezed—
The omen showed that he was pleased
To give his blessing.*

This harmless superstition, however, seems to have ended with the classic ages; but the custom of saluting those who sneeze still survives in many parts of continental Europe. In the beginning of last century, M. Morin tells us that the Anabaptists in England had made themselves remarkable, among other things, by the 'whimsical seal' with which they combated this custom; and in the preceding century, the essayist Montaigne said, 'Let us give an honest welcome to this sort of wind, for it comes from the head, and is blameless.' Snuffing, we fear, has had a hand in the decay of this remnant of ancient politeness; for we find the first-mentioned author lamenting that 'there is great reason to fear that we shall soon see this respectable custom die out; for sneezings have become so frequent, and so much in vogue, that it is rare now-a-days to see produced naturally those salutary functions which the human race has so justly deemed worthy of its respect. They are forced from nature whether she will or no, and it is no longer the same thing.'† There can be no doubt that superstition, from whatever cause arising, mainly engendered this respect for the function of sneezing; and accordingly, by the learned even of ancient times, it was frequently disregarded as a vulgar prejudice. But Clement of Alexandria, in his little treatise of politeness, goes further than this, and regards sneezing as a mark of intemperance and effeminacy: he says that it should be suppressed as much as possible, and is most unmeasured in his reprobation of those who seek to procure it by extraneous means. Though very many now-a-days set at defiance this anathema of the Greek Chesterfield, yet the usages of modern society coincide in the main with his suggestions; and when in company with those we respect, if sneeze we must, we at least endeavour to conceal it from observation.

Aristotle of old declared sneezing to be a favourable symptom of health; and the rather humorous light in which we generally regard it seems to confirm his decision. It is a gentle stimulus to a languid system—it is a refreshing evacuation of the head, which at once pleases and relieves us: such, say many, are the benefits of a hearty sneeze. But not so think many erudite disciples of *Æsculapius*. 'Hearty sneeze!' says Olympiodorus and his followers; 'why, sir, you're jesting with an earthquake, sir—an alarming physical convulsion! Does it not disfigure the prettiest face with epileptic tremors! It is a syncope, sir; nay, sir, it is a short epilepsy!' (*brevis epilepsia*). Verily this is a grave charge against sneezing. It is but lately that it first met our startled ears; but since then, we have ever looked upon a snuffer as a sort of swindler of the sexton—one who should long ago have been a source of revenue to some deserving cemetery company. Either the classic doctors are superannuated, or snuffers are infatuated sensualists, who, for the sake of a gentle titillation, and a still gentler nasal intoxication, peril in a single day more lives than a cat's. Their existence is a constant libel on the fair fame of Olympiodorus. Which, then, is right—the Greek or the disciple of Raleigh! The question, doubtless, seems *primâ facie* a very interesting one, affecting alike the queen on the throne and the child in the nursery; but on so grave a subject,

'Who shall decide, when doctors disagree?'

Perhaps much, as Sir Roger de Coverley remarks, may be said on both sides. For ourselves, we are content to

* Blackwood's Magazine.

† Mémoires tirés des Registres de l'Académie Royale des Inscriptions et Belles Lettres. Vol. v. p. 445 Paris, 1794.

believe that, like the patriarch, we enjoy a reprieve from the perils of sternutation. Moreover, we don't give a snuff for a sneeze—no, nor take one either; but should any of our readers think fit to investigate the subject, perhaps the society *De Lunatico Inquirendo* may present him with a cap and bells for his pains.

A VOICE FROM THE DEER FOREST.

In the midst of the dust and fret of political turmoils, statistics of misery and crime, and the many vexing questions that agitate our larger seats of population, one's mind is inexpressibly relieved in getting into the private society of some familiar old author, or into the presence of some sweet picture of tranquillity and innocence, or, better still, into some remote nook of the country, where we at once find nature in her best dress, and the few inhabitants still in a tolerable state of simplicity. We must hasten to tell the reader that a relief of this kind has been afforded to us in unusual amplitude by a book of the day, which, finding us deep in the troubles which pervade the world, from Paris to Vienna, and from Naples to Holstein, carried us in an instant into such a natural scene, and such a mental intercourse, as we had scarcely believed to have been left to these later times.

Had it fortune to an Englishman fifteen or sixteen years ago to visit the county of Elgin in the north of Scotland, he could not have failed to hear of the Earl of Moray's forest of Tarnaway, which then stretched for miles along the banks of a grand Highland stream—the Findhorn—in all the untrimmed luxuriance which he would have expected in going to wait on the duke in Arden. He would have been further surprised to hear of two brothers entirely realising the old ballad ideas of gallant young huntamen—superb figures, attired in the ancient dress of the country, and full of chivalric feeling—who, giving up the common pursuits of the world, spent most of their days in following the deer through this pathless wild. Men of an old time they seemed to be, of frames more robust than what belong to men now-a-days, and with a hardihood which appeared to make them superior to all personal exposure and fatigue. At the same time, they possessed cultivated minds, and no small skill in many of the most elegant accomplishments. These gentlemen have since made their names known in connection with works illustrating our national antiquities; and it is to them we are now indebted for the book by which we have been so pleasantly witched out of the sense of these dreary days. It is, in reality, a report of their Tarnaway life, brought forth when looked back to from a distant land and a tamer period of existence, but still glowing with unwonted fires, and suffused with the colours of a rich imagination.

The first volume is composed of romantic and sentimental poems, which will, we fear, be felt as heavy, and this simply because of the indistinctness of meaning and purpose which belongs to the greater part of them. And yet there are fine things here, as, for example, in the following fragment of an address from the elder to the younger brother on parting:—

— 'Sad for thee I sigh;
Thou wert the loadstar of mine eye,
Pleasant and ever true to me,
Passing all maiden's constancy.
Thou hast been woven in my heart
Through every fibre's vital part;
For on life's weary steep till now
That we look downward from his brow,
We shared in every care and glee
From childhood to maturity.
I shaped thy toys in infant play;
And skilled thy hand in mimic fray;
Within my cloak at winter hour
Oft fenced thee from the wind and shower,
And oft the weary summer's day,
When hot the sun, and long the way,

I held thy hand, and checked the stride
Thy little footstep paced beside.
Full often when the ford was deep
I bore thee through the torrent's sweep;
And oft to win the eagle's nest,
Held fast the rope which bound thy breast,
And when thy eager arm and grasp
Too short the cushat's tree to clasp,
Have lent my shoulder to thy foot,
And borne thee upward from the root;
Often I kept the orchard gap,
Or shook the fruit into thy lap;
And often at the twilight gray
Held the fierce shepherd's dog at bay,
While thou with willow brand and shield
Routed the flock upon the field.

The days of youth have come and gone
Like shadows on the dial stone;
And manhood's sterner hour has brought
Realities—for visioned thought.
We've proved each toil and peril task
Which childhood aces in idle maek. * *
Thou'st fought beside me in the meall,
Warded the brand in conflict fell,
And when the dreadful day was lost,
And I was 'numbed with wounds and frost,
Thou bore me from the carnage fleet,
Through fire and smoke and battle sleet.
Thou'st seen the joys, the hopes of youth,
Wane from my heart like maiden's truth;
Through days of grief and nights of care,
Watched by my couch, and kept my chair.
In sickness, sorrow, and despair,
And when my sad soul ebbed away,
Struck the sweet harp, and waked the lay,
And stilled the trembling mortal strife,
And called my spirit back to life.

Alas! that I should live to see
The day that we should severed be,
Should look upon the earth and air,
The springing flower, the sunshine fair,
Should have a joy, a pride, a care,
And thou not near to soothe and share. * *

I stood where he had stood, and drew
The sweet wood air as he should do,
And trod his footsteps in the sand,
And grasped the tree where leant his hand,
And till mine eye could see no more,
Gazed on the boat, the stream, the shore,
The water he should ferry o'er,
The lonely rock and clatach gray,
Where he should land full many a day,
When I was long and far away.
I looked to heaven, and sun, and sky,
The gray gohawk that hovered high,
The dewy flower, the birken brae,
And turned with broken heart away,
That they could not—bird, flower, and tree—
Look back and speak farewell to me:
But they do speak, and make their mourn;
The wren flits restless through the thorn,
The linnet sits in greenwood still,
The owl is silent on her bill,
The gray hawk perches on the rock,
Nor heeds below the cuckoo mock,
And the buck bends his velvet ear,
And wonders why he does not hear
My wandering step and holla clear.

But I shall turn in happier hour
To rock and stream, and tree and flower;
The boughs shall bud, and the bloom shall spring,
And the little bird in greenwood sing,
And the owl shall cry upon the tree,
The dun-deer bell upon the lea,
And the gray hawk shriek to welcome me,
And the sun shall shine on tree and tower,
On bank and stream, on rock and flower,
And all whereon I loved to see
His blessed light shine merrily;
And I shall sit thy board beside,
And look upon thy arms of pride,
And see thy trophies won the while,
The antlers and the furry spoil;
And sit beneath, and hear thee tell
Of how they run, and where they fell.
Oft shall we trace the feat again,
By wood and stream, by hill and plain;
And often in thy shallow light,
Ferry the stream at morn and night.
Oft couch upon the heather-bed,
On the same mantle lay our head;
And when the even light grows pale,
Oft spread our meal upon the fail,
Beneath the rock, beside the stream,
And tell of this day as a dream.

So shall the dark years pass away.
 And when at last our steps decay,
 Upon the staff, ere day is done,
 Still shall we totter to the sun;
 And when we may not tread them more,
 Look to the hill, and wood, and shore,
 And gaze around on tree and flower,
 Like travellers at parting hour.
 And when shall come life's closing day,
 And we from earth must pass away,
 Near all that we have loved so deep,
 Amid the heather we shall sleep,
 Beneath the moss and lichen hoar,
 Where often we have slept before.
 Under our arm the fawn shall lie,
 And o'er our head the owl shall cry,
 And in the soft moss on our breast,
 The wren and robin build their nest;
 The hawk shall channer on the heath,
 The wandering buck shall bell beneath;
 And every year at turn of spring,
 Where the gray oaks their branches swing,
 The cuckoo o'er our bed shall sing.
 There shall the wild rose shed her flower,
 And the bat fly at evening hour;
 And there the wood-dove make her moan,
 And the bee wind about the stone,
 And drink the dew, and suck the bell,
 And there the lonely breeze shall toll
 When sweetly tolls the vesper knell.*

These are the words of nature in expressing one of her most beautiful feelings.

The second volume is wholly composed of prose notes, in which the popular attraction of the book chiefly resides. Here we find copious details concerning forest life and the craft of deer-hunting, together with many curious legends of the Highlands, and what is perhaps the most respectably useful thing in the work, many original observations on the habits of wild animals. The descriptions of the forest itself are of striking beauty and interest. 'Few knew what Tarnaway was in those days—almost untrdden, except by the deer, the roe, the foxes, and the pine-martins. Its green dells filled with lilies of the valley, its banks covered with wild hyacinths, primroses, and pyrolas, and its deep thickets clothed with every species of woodland luxuriance, in blossoms, grass, moss, and timber of every kind, growing with the magnificence and solitude of an aboriginal wilderness—a world of unknown beauty and silent loneliness, broken only by the sigh of the pines, the hum of the water, the hoarse bell of the buck, the long wild cry of the fox, the shriek of the heron, or the strange mysterious tap of the northern woodpecker. For ten years we knew every dell, and bank, and thicket, and excepting the foresters and keepers, during the early part of that time we can only remember to have met two or three old wives who came to "crack sticks" or shear grass, and one old man to cut hazels for making baskets. If a new forester ventured into the deep bosom of the wood alone, it was a chance that, like one of King Arthur's errant-knights, he took a tree "to his host for that night," unless he might hear the roar of the Findhorn, and on reaching the banks, could follow its course out of the woods before the fall of light. One old wife, who had wandered for a day and a night, we discovered at the foot of a tree, where at last she had sat down in despair, like poor old Jenny Macintosh, who, venturing into the forest of Rothemurchas to gather pine-cones, never came out again. Three years afterwards, she was found sitting at the foot of a great pine, on the skirt of the Brae-riach, her wasted hands resting on her knees, and her head bent down upon her withered fingers. The tatters of her dress still clung to the dry bones like the lichen upon the old trees, except some shreds of her plaid, which were in the raven's nest on Craig-dhubh, and a lock of her gray hair that was under the young eagles in the eyry of Loch-an-Eilean.

* If such danger had no real existence in Tarnaway, it was an appalling labyrinth to the simple muirland cotters, accustomed to no more foliage than a rowan-tree and a kail-stock, and who had no thought to guide themselves with the sun by day and the stars by

night. It had been otherwise in the old time, for Tarnaway was only the remnant of the vast expanse of wood which had stretched over the plains and braes of Moray, from Rothemurchas to the sea, and from the shaws of Elgin to the ancient oaks of Calder and Kilravoch. Enclosed, like Cadzow and Chillingham, out of the remains of the ancient British forests, within its range every species of native tree bore testimony of its aboriginal vigour. . . . Natural oaks and ash have shown a diameter of six feet, and shoots from the stools of the former have grown seven feet in the first year. There was an alder opposite to Slui which was eleven feet in circumference, and in other banks of the river grew birches from nine to twelve. In 1826, some of the forest roads and large tracks of the wild wood were availed, and filled with the most beautiful beeches, equal, according to their growth, with the best of their contemporaries in Oxfordshire or Buckinghamshire. One approach to the castle was an alley of larches a mile in length, and of unrivalled magnificence; and many a secluded knoll in the depths of the forest was tufted by august spruces feathering into the grass, and exhibiting the richest foliage and most vigorous growth. It is probable that at this time Tarnaway was unequalled in Great Britain for the beauty, extent, and variety of its wood scenery. Its artificial productions, however, were less interesting than the remains of the mighty aboriginal pines, the oaks which had no doubt seen the Raid of Harlaw, and the gigantic hollies, which in some parts covered the "pots" and braes, and were not exceeded, perhaps not equalled, in Great Britain. Of the former there were a few, of which the largest were fourteen feet in girth, and of the latter many of the trunks were six feet in circumference, and supported a mass of foliage from fifteen to twenty feet in diameter, and so close, that the heaviest snow and driving rain never laid the dust at their feet. Many a storm have we sat out dry and warm under their green roofs, and often scared the humpbacked bucks and ruffled woodcocks, which ran cowering before the drift, or dropped out of the blast to shelter where we had gone before them.'

Through this region and the neighbouring hills the two brothers pursued the deer for many a day. Sometimes they would lie abroad all night, waiting to renew the chase of some particular animal next day. Sometimes, to regain their home, they would cross the Findhorn under circumstances involving such peril, that, considering the frequency of the act, it is surprising that they escaped drowning. One of the things essential to such a life is to have deposits of refreshments concealed in various places throughout the wilderness, to which the hunter can resort when it suits his convenience. The brothers ultimately found it necessary to build a hunter's hut, in which themselves and their attendant could pass the night when occasion demanded. According to the description by the younger—'There is a high and beautiful crag at the crook of the river near the "Little* Eas"—a precipice eighty feet in height, and then, like a vast stone helmet, crowned with a feathery plume of wood, which nodded over its brow. From its top you might drop a bullet into the pool below; but on the south side there is an accessible woody bank, down which, by planting your heels firmly in the soil, and among the roots of the trees, there is a descent to a deep but smooth and sandy ford. Upon the summit of the rock there is, or there was—my blessing upon it!—a thick and beautiful bird-cherry, which hung over the crag, and whose pendent branches taking root on the edge of the steep, shot up again like the banana, and formed a natural arbour and close trellis along the margin of the precipice.† Behind its little gallery there is a mighty holly, under which the snow rarely lies in winter, or the rain drops

* Eas beag [Little Waterfall].

† The bird-cherry shoots vigorously in this kind of reproduction.

in summer. Beneath the shelter of this tree, and within the bank at its foot, I dug a little cell, large enough to hold two beds, a bench, a hearth, a table, and a "kistic." The sides were lined with deals well calked with moss, and the roof was constructed in the same manner, but covered with a tarpauling, which, lying in the slope of the surrounding bank, carried off any water which might descend from thaw or rain, and when the autumn trees shook off their leaves, could not be distinguished from the adjoining bank. Its door was on the brink of the crag, veiled by the thick bird-cherries on the edge of the precipice; and the entrance to the little path, which ascended from either side upon the brow of the rock, was concealed by a screen of birch and hazel, beneath which the banks were covered with primroses, wood-anemones, and forget-me-nots. Bowers of honeysuckle and wild roses twined among the lower trees; and even in the tall pines above, the rose sometimes climbed to the very top, where all its blossoms clustering to the sun, hung in white tassels out of the dark-blue foliage. There the thrush and the blackbird sung at morning and evening, and the owl cried at night, and the buck belled upon the Torr. Blessed, wild, free, joyous dwelling, which we shall never see again!

Many adventures with the deer are recorded, some of them full of wild animation, and at the same time displaying the extraordinary sagacity of the animals. There is one story of a deer which, after being wounded, kept up a run till the third day, passing in this space of time over a large tract of country, and making many singular *treasons*, as the phrase is, in his attempts to escape. We have not room for any of these more lengthened narratives, interesting as they are, and must content ourselves with one which, in comparison, is little better than an anecdote, and yet is characteristic of the animal. 'One dark cloudy day, in the depth of winter, we followed a buck, which was like the German leg or the Wandering Jew, and took us all over the forest, into all the burns, and round all the lochs and heights, crossed through the middle of the castle park, down the road of the east farm, between the houses and the square, across the garden, and into the burn at its foot, where of course we lost him for a time. "Wonderful buck, sir!" said Donald; but "*buck*" only by conjecture: for whether buck, doe, or demon, we had never a glimpse of his head to say, and only judged his gender by the size of his slot and the wide spread of the dew-clees. With the burn he returned again into the forest, and only left the water, as we suppose, because he met an old woman's cow, which was standing up to her knees in the pool, where the long sweet grass grows down to the Glac-Lucrach. From thence he went away over the pots to St John's Logie, treasoned all over the wet woody bog, and into the brae of the Tober-shith. I made for the Giuthas-mòr, where a famous run comes up from the hollow, but the deep toll of the hounds passed along the middle of the bank, and went away for the river. I examined the slot, to see that it really had *four* legs, though, it is true, that was little satisfaction, since we have no authority that the fiend does not sometimes go on all-fours, as, according to the Arabians, he occasionally does on one. As long as the dogs led, however, we should certainly have followed, though he had as many legs as a millepede, or no more than a Nim-Juze. Where he went, however, or how we followed, it would be too tedious to relate. Keeping under the wind, we continually checked him by the cry of the dogs, until only old Dreadnought was left on the track, and at last the roe turned short in the face of a pass where I was posted before him, and took wild away for the hamlet of Ceann-na-Coille. This utterly threw me out, as there was no understanding such a buck—who, like Napoleon in Italy, left fortified posts on his flank, and otherwise disregarded the old pig-tailed rules of war—besides which, from his last direction, it was probable that he was a Brodie buck, and was gone straight away for his own woods. However,

I followed to hear what had become of him; and though I lost the cry of the hound, tracked the slot till it brought me out of the wood to a little cottage, where I found Dreadnought, very unlike himself, pottering about at the gavel of the house. I thought he was bewitched, till, as I traced the buck's foot, I also lost it near the same place, and neither he nor I, by nose or sight, could make any more of it than if, like one of Tasso's dragons, the buck had started into the air. While we were groping in the road, and Dreadnought taking a cast about the house, to the great discomfort of the old wife's cocks and hens, she brought out the usual cottage hospitality—the bowl of "*set*" milk; and as I was rewarding her with news of her cow, which she had lost for three days in the forest, and was the same "knock-kneed, how-backit, glaikit horned auld carline" which had turned the buck in the morning—there was a challenge from old Dreadnought in the kailyard! I threw the bowl into the barley-mow, and sprang upon the dike, where I saw the deep print of the buck's foot in the soft mould of the potato plot, into the middle of which he had bounded from the road, clearing the dike at a right angle, over which the dog had run, wondering where he had flown from his last slot. I had scarce time to observe the marks, when the hound opened at full cry, made a demi-tour into the wood, across the road, and into the thorn jungle on the burn; from which, as before mentioned, we had lost our buck of the three days' run. As, however, the roe was now tolerably fresh, I judged that, rather than follow the water into the open pines, he would return for the birken braes and thorny hollows behind him. To intercept him, therefore, I kept the flank of the stunted firs, which, straggling over the moss between the burn and the castle road, are the connecting cover between the jungle and the woods. I had just left the tall trees, and was making for the dike, when the cry of the dog turned towards me; in an instant after, and for the first time in the day, I saw the buck himself; he came bounding through the centre of the little scraggy firs, glanced over the road, and as he leaped upon the dike, the shot just caught him in the spring with which he topped the fall.'

We conclude for the present with a picture of animated nature, which no common hand could have sketched. 'In the bedding season the does retire into the most secret thickets, or other lonely places, to produce their young, and cover them so carefully, that they are very rarely found; we have, however, deceived their vigilance. There was a solitary doe which lived in the hollow below the Bràigh-cloiche-léithe in Tarnaway. I suppose that we had killed her "*marrow*;" but I was careful not to disturb her haunt, for she was very fat and round, stepped with much caution, and never went far to feed. Accordingly, when, at evening and morning, she came out to pick the sweet herbs at the foot of the brae, or by the little green well in its face, I trode softly out of her sight, and if I passed at noon, made a circuit from the black willows, or thick junipers, where she reposed during the heat. At last, one fine sunny morning I saw her come tripping out from her bower of young birches as light as a fairy, and very gay and "*canty*"—but so thin, nobody but an old acquaintance could have known her. For various mornings afterwards I saw her on the bank, but she was always restless and anxious—listening and searching the wind—trotting up and down—picking a leaf here and a leaf there, and after her short and unsettled meal, she would take a frisk-round-leap into the air—dart down into her secret bower—and appear no more until the twilight. In a few days, however, her excursions became a little more extended, generally to the terrace above the bank, but never out of sight of the thicket below. At length she ventured to a greater distance, and one day I stole down the brae among the birches. In the middle of the thicket there was a group of young trees growing out of a carpet of deep moss, which yielded like a down pillow. The prints of the doe's slender forked feet were thickly

tracked about the hollow, and in the centre there was a bed of the velvet "fog," which seemed a little higher than the rest, but so natural, that it would not have been noticed by any unaccustomed eye. I carefully lifted the green cushion, and under its veil, rolled close together, the head of each resting on the flank of the other, nestled two beautiful little kids, their large velvet ears laid smooth on their dappled necks, their spotted sides sleek and shining as satin, and their little delicate legs as slender as hazel wands, shod with tiny glossy shoes as smooth and black as ebony, while their large dark eyes looked at me out of the corners with a full, mild, quiet gaze, which had not yet learned to fear the hand of man: still, they had a nameless doubt which followed every motion of mine—their little limbs shrunk from my touch, and their velvet fur rose and fell quickly; but as I was about to replace the moss, one turned its head, lifted its sleek ears towards me, and licked my hand as I laid their soft mantle over them. I often saw them afterwards when they grew strong, and came abroad upon the brae, and frequently I called off old Dreadnought when he crossed their warm track. Upon these occasions he would stand and look at me with wonder—turn his head from side to side—snuff the ground again, to see if it was possible that he could be mistaken—and when he found that there was no disputing the scent, cock one ear at me with a keener inquiry, and seeing that I was in earnest, trot heavily onward with a sigh.

OUR COUSIN EPPY FORBES.

We were on a visit to some friends, residing in a retired country town, when hearing of the eccentricities, or, more properly speaking, the peculiarities of an ancient lady, Miss Forbes by name, and comparing notes, we found that she was a cousin of our own. This relationship, indeed, was thrice removed; but according to Scotch computation, that is no very distant degree: so we determined to seek her out, and gain admittance to her domicile; a mark of favour not always vouchsafed to the many, the value of the privilege being of course enhanced to the favoured few. After more than one failure, our repeated summons, both with knocker and bell, being unheeded or unheard, we at length succeeded in introducing ourselves. Miss Forbes inhabited an old dingy-looking house, situated on the further hill-side, beyond the precincts of the town; it was several storeys high, tall and thin, and bare of windows towards the highway; and we understood that she had never crossed the threshold for the last twenty years, except to attend divine service in a neighbouring church twice on each Sabbath day. We were, moreover, informed that, since the death of her old servant, she retained no regular domestic, but always slept fearlessly in the habitation alone; her wants being attended to each morning, as the case might require, by a young girl, who gladly performed the simple offices required; for although Cousin Elspeth, or, as she was familiarly called, Eppy, was not reputed to be wealthy, but, on the contrary, was known to possess a very slender competence, yet the half of that she divided with those who were poorer, and needed help.

The door was opened by a stout upright old lady, very much scarred and disfigured in the face by the smallpox. On listening to our errand, and producing our credentials, Miss Forbes—for it was she—requested us to walk into the parlour and be seated. We really felt half abashed in the presence of this lone woman, for the simple dignity and calm courtesy of her bearing, old-fashioned and quaint though it was, repelled anything like familiarity or undue curiosity; whilst kindness unfeigned, and an innocent truthfulness, which

evidently came from the heart, disarmed all wish, if such a wish existed for a moment, to turn her into ridicule.

After our pretensions to relationship had been freely discussed, and frankly admitted by the old lady, she produced refreshments of the most primitive order from an adjoining closet, inviting us to partake of them, and the breezy air on the hill-side had such an appetising effect, that we did ample justice to the wheaten loaf; but when our entertainer arose to leave the room, taking in her hand a vase of the classic shape, which, we are given to understand, the Pompeian damsels used to carry water in, and which Cousin Eppy designed for the same purpose, we insisted on performing the office for ourselves. But with a soft and gingerly step, and an air as dignified as that of some fabled princess, she courteously waved her hand for us to resume our seat, and swam out of the apartment, returning in about five minutes with the vase filled to the brim with sparkling ready-iced delicious nectar, eagerly quaffed by thirsty, dusty, matter-of-fact mortals. And yet, notwithstanding her hospitality and kindness, we intuitively felt that all attempts on our part to converse intimately as relatives were met with good-breeding, it is true, but also with an impassable barrier of self-withdrawal: so we readily accepted Cousin Eppy's invitation to take a turn in the garden, looking about us, nevertheless, in gratification of our curiosity, as much as circumstances permitted.

The reception parlour had literally nothing in it save a few high-backed antique chairs and a table; and in the small room leading into the garden (Cousin Eppy's own sanctum), in addition to the same articles of furniture, there was a Bible and Prayer-Book; but no sign of feminine occupation; no books save the best; no nick-nacks or nonsense of any description. We heard the regular monotonous tick of the clock, but we looked in vain for a cat to enliven the scene with its companionable purr; and I speedily found myself picturing the long winter evenings of the past twenty years, passed alone, without books, without conversation, interest, or occupation.

By and by I endeavoured to frame a romance, with all its adjuncts, as appertaining to our cousin's history; but when I looked on the old lady's countenance, and conjectured at what epoch of her life the puckering and seams had thus disfigured it, and when I learnt that she was only ten years of age when attacked by the virulent enemy which had left its mark behind, I no longer succeeded in fancying her the heroine of a bygone tale of sentiment, wherein celibacy and a love of solitude originated in the somewhat commonplace episode of disappointed affections.

The garden—if garden it might be designated, when its aspect was that of waste land, with long coarse grass luxuriantly waving, and wild rose-trees scattered about—lay on the hill-side, open and airy; a broad gravelled walk or terrace ran along the high part, while the domain was bounded by a row of hardy Scotch firs, whose stems were entwined with rich masses of honeysuckle, the summer bloom and sweet odours contrasting strongly with the wintry savage foliage of the dark evergreens. On this terrace, Cousin Eppy informed us, it had been her custom to promenade for at least three hours, during some portion of each day, for the last twenty years, leisurely sauntering up and down, shaded by her huge green parasol from the summer's heat and glare, and protected by a capacious muff from the winter's frost and cold. The view from this terrace,

which had a southern aspect, was a lovely and extensive one, far away over hill and plain; and in the distance, just peeping and glittering between the hills, the sea, the 'deep blue sea,' was discernible, with now and then the snowy sails of some passing bark, on which a ray of sunshine rested—the only moving object in the solitary scene. Here, too, half-hidden by eglantine and wild creepers, midway down the ascent, we found the fairy spring which had afforded us such refreshing beverage; the water gushed gently up into a small rounded basin, and from thence trickled away unseen beneath the profuse underwood of Cousin Eppy's neglected pleasure-grounds.

I longed to ask this strange antiquated cousin *how* she passed her time?—how she reckoned up the innumerable days which had glided by?—what her memories were, and what her hopes or anticipations? Was she devoted to contemplation, or was it the mere apathetic indulgence of a misanthropic disposition, joined to eccentric habits and whims? After-circumstances, indeed, proved that there was no mystery to be solved; for the time arrived when I enjoyed close and frequent communion with Eppy Forbes, and after a lengthened period had elapsed, her confidence and friendship; which latter marks of favour had been so sparingly dispensed by her during her long pilgrimage, that I felt myself especially honoured in possessing them.

She had been transplanted from her native Highland home at an early age, to fulfil the duties of companion and humble friend to a noble lady, with whom she had continued to reside after the latter's marriage with Lord Annesley. It was surmised that ties of 'blood-relationship' existed between the impoverished Scotch family and the wealthy English one from intermarriages long ago. Be that as it might, after more than twenty years' devoted attendance on her lady, ten of which were passed in a sick-room, tending the heroic and gentle sufferer, who at length breathed her last in Eppy's arms, she was installed as housekeeper at Annesley Park, which became a deserted mansion after Lady Annesley's death, and the situation, consequently, was considered a sinecure. Here Eppy passed ten more years of loneliness, amidst tapestried desolation and mouldering grandeur, happy in occasionally receiving tidings of her dear young lady, the only child of her late lamented mistress; but whenever Eppy came to this part of her reminiscences, she always spoke in a half-whispering mysterious manner, just as if, by so doing, she concealed what the world knew full well—namely, the sad history of the fair Maude Annesley, whose ill-assorted union and early death formed the one engrossing theme of poor Eppy's life, although she rarely indulged herself in *speaking* of it, and then with deep solemnity. She communed with her own heart silently in her chamber, and was still.

On Lord Annesley's decease, Eppy was removed from Annesley Park, and a small annuity being conferred upon her, together with the freehold on the hill-side, Eppy considered that she was permanently settled for the remainder of her days; and, as already mentioned, she had never quitted her home, save for the purposes of devotion, during twenty years occupancy.

It seemed Eppy Forbes's fate to pass her life amid scenes of suffering and solitude; and when trouble fell heavily on her noble patron, it fell heavily on Eppy's heart also, and caused 'her sun of life to set,' to use her own poetical expression. And she used to say, having once associated with the great, the good, and the learned, how was it possible she could bear to mix in inferior society? *She* could feel no new interests, and what to *her* were the petty concerns and gossipings of the little world around? No: she rose at six every morning, read her Bible, and performed her religious exercises, breakfasted, attended to her simple domestic concerns, received her poor patients—for Eppy was somewhat of a quack, though well skilled in the use of medicinal herbs—walked on her terrace and *sniffed the sea-breeze*,

dined early and frugally, read her Bible again, walked again on her terrace, took a great many cups of tea, walked again, and read the 'Best Book,' and finally ascended to her 'observatory'—one of the empty rooms at the top of the house, from whence she made her own primitive observations, and still more extraordinary calculations concerning the heavenly bodies: in short, Eppy had invented an astronomical code of her own. In this 'observatory' she passed many peaceful and happy hours, far removed from earthly cares, pomps, and vanities; and though her usual hour of retiring to rest was at nine o'clock punctually, yet a cloudless starry night often enticed her to commit the dissipation of late hours.

There was one little episode during her long and passionless career which probably was as full of sentiment and interest to Eppy Forbes as a cherished remembrance of deep and sad import to others differently circumstanced. The good old lady would blush on repeating her simple narrative, and use her large fan, not without having frequent recourse to a bottle of pungent smelling salts. It was as follows:—One of the very few journeys she had ever performed was on her removal to Annesley Park, situated in a remote part of England. She travelled in a stage-coach, and the fellow-traveller who shared the inside with her was, as Eppy described him, 'a comely, fresh-coloured, elderly gentleman, who, she thought, must be a law practitioner, from the nice way in which he spoke, and also because he had a large blue bag with him.'

Eppy was a timid traveller, the road was hilly, and the coach was a fast one; but the pleasant gentleman with the blue bag reminded her that it was always the safest plan to sit quite still, with the arms kept close to the sides, to prevent their being broken, should an accident occur. Soon after enforcing this prudent and excellent advice, which Eppy scrupulously followed, there was a sudden crash, and the coach overturned. The insides happily escaped unhurt, but poor Eppy's terror was of course excessive. Her fellow-traveller was extricated first, and then she heard his friendly voice exclaiming, 'Give me your hand, madam; gently—gently. I hope you are not hurt. There—step lower, madam. Don't be afraid—you are all safe now!' The accident had happened within a mile or two of the nearest town, and in the midst of a beautiful wooded valley, and the passengers walked forward to wait until another conveyance should be in readiness. 'And only imagine my feelings,' Eppy added in a softened tone, 'when my amiable fellow-traveller, escorting me along the highway, smilingly asked if I knew by what means I had descended with so much ease from the topsyturvy coach! I did indeed remember stepping on *something*; and never have I ceased to cherish the remembrance of so chivalrous an act. "Ah, madam," said this gallant knight, "your fairy feet rested for a moment on the knee of your humble servant, who, kneeling on the other, thus performed a page's duty, most happy in being able to tender his poor services!" I could not express my thanks, for I was perfectly overcome; and though I never heard of him again, or learnt who he was, yet had I ever married, I would have desired that my husband might closely resemble this charming individual.'

Worthy, simple, true-hearted Cousin Eppy! She passed away as calmly as she had lived, after only a few days' illness; and there came into my possession a small cabinet picture, the dearest hoarded treasure of her life, and which I succeeded in restoring to those who value it as an inestimable relic. It represents a bright happy-looking girl, with laughing blue eyes and waving sunny locks; and *this* was the resemblance of the fair Maude Annesley, who had died, it was said, of a broken heart ere the auburn ringlets turned to gray, or the snowy brow betrayed a line. As Eppy herself often used to remark, when gazing on that picture, 'it was an owre true lesson on the instability and perishing nature of earthly happiness and grandeur; uncon-

sciously quoting the words of St Pierre, that 'Could we allow ourselves to be persuaded that there was no such thing as a future life, how many sorrows would remain without consolation!'

MISCHIEVOUS SCHOOLBOYS.

We perceive an amusing and not uninstructional article on 'Mischievous Boys' in the Glasgow Trainer's Monthly Record. The writer thinks that mischievous schoolboys have never had justice done them—they are called 'good-for-nothing young rascals,' whereas they are good for something, if teachers and parents only knew how to draw the good out of them. The true way of going to work with boisterous overbearing boys is to divert their energies into some useful channel; severity of discipline is unavailing, and perhaps only makes bad worse. We shall extract a few passages on the subject.

'Many melancholy examples might be given of the serious effects of [school] mismanagement of this kind on the after-life of some of the most gifted men our country's science and literature can boast. Punishment may coerce the tongue into silence, it may pinion the outward conduct, but the inward is beyond its power. The very force that squares the external actions by a series of compressions, stirs up rebellion within, excites the busy workings of the heart to belie the arm and the tongue, it encourages the constant frown, it educates the secret determination of revenge, it trains to a continuous sullen obstinacy of character, and not unfrequently converts the generous and openly mischievous boy into that most hopeless of all characters—the doggedly and sneakily mischievous.

'The recollections of every one will readily furnish many examples of the conflict here referred to, as maintained between the mischievous boy and the master. Have you ever seen, reader, such a boy, charged with faults in which he had no share, refusing either to plead-guilty himself or to criminate others, standing calm and collected in the midst of a school of sympathising faces, before a teacher enraged, and helpless because enraged? Do you not remember, as lash after lash fell brutally on the boy's head or hand, and he struggled with the heroism of a martyr to keep back the tear that was forcing itself into shape in his eye, how every scholar felt as if he could spring upon the master and bear him to the earth? Never did this boy, the victim of the master's wrath, stand out so boldly as an example to the school. The master rendered this very punishment the means of greater mischief than ever the boy wrought; the scholars loved the one, and hated the other; and deservedly did they hate him.

'Far be it from me to look lightly on the conduct of the mischievous boy, or to attempt to extenuate his errors. All that I plead for is, that an effort be made to understand his character; that it be analysed and examined without prejudice, and with the sole desire of his good; and that when the ruling principle of his moral nature has been discovered, and separated from the others, it be mildly, yet firmly guided into healthful exercise. If he is fond of power, for example, let him have charge of some of the playground amusements, and the importance of his office will lessen the boisterousness of his manners. If he is fond of combinations, and causes incessant confusion, by arranging, in the intervals of school exercise, copies, or slates, or forms, after some newfangled methods of his own—the summary infliction of punishment, if he happens to be caught in the midst of his arrangements, will do no good; it will only drive him to seek, in less innocent, because more hidden amusement, the morbid gratifications arising from the muscular and intellectual exercise of his favourite pursuits. Let him have charge of the mechanical economy of the school, and have carefully shown him the order of everything, and I venture to affirm that not even a pen will be allowed to remain out of its place. It is unnecessary to multiply hints like these.

'When he is gratified in this way, and won to the master's side—when the teacher has thus thrown himself into the spirit of the boy, he can mould, and direct, and restrain at will this excessive love of power. When the moral character is thus led, the boy works cheerfully, his ruling intellectual faculty soon discovers itself, and the master is enabled to strengthen those other faculties that would lie unexercised, on account of the unvarying gratification furnished by the one class of favourite intellectual pursuits. By a simple, forbearing method of this kind, the openly mischievous boy, the "thorn in the school,"

"the plague of the master's life," may become one of the most powerful and pleasant instruments in his hand for the regulation of others; and a mind that would have been withered or gnarled by a dignified, unbending Dombey-like chilliness, may blossom and blossom, and become richly laden with fruit.'

DOMESTIC HAPPINESS.

Ah! what so refreshing, so soothing, so satisfying, as the placid joys of home! See the traveller—does duty call him for a season to leave his beloved circle? The image of his earthly happiness continues vivid in his remembrance, it quickens him to diligence, it makes him hail the hour which sees his purpose accomplished, and his face turned towards home; it communes with him as he journeys, and he hears the promise which causes him to hope—"Thou shalt know also that thy tabernacle shall be in peace, and thou shalt visit thy tabernacle, and not sin." On the joyful reunion of a divided family—the pleasures of renewed interview and conversation after days of absence! Behold the man of science—he drops the laborious and painful research—closes his volume—smooths his wrinkled brow—leaves his study, and unbending himself, stoops to the capacities, yields to the wishes, and mingles with the diversions of his children. Take the man of trade—what reconciles him to the toil of business?—what enables him to endure the fastidiousness and impertinence of customers?—what rewards him for so many hours of tedious confinement? By and by the season of intercourse will behold the desire of his eyes and the children of his love, for whom he reigns his ease; and in their welfare and smiles he will find his recompense. Yonder comes the labourer—he has borne the burden and heat of the day—the descending sun has released him of his toil, and he is hastening homeward to repose. Half-way down the lane, by the side of which stands his cottage, his children run to meet him. One he carries, and one he leads. The companion of his humble life is ready to furnish him with his plain repast. "See his toil-worn countenance assume an air of cheerfulness! His hardships are forgotten—fatigue vanishes—he eats, and is satisfied. The evening fair, he walks with uncovered head around his garden—enters again, and retires to rest; and 'the rest of a labouring man is sweet, whether he eat little or much.' Inhabitant of this lowly dwelling, who can be indifferent to thy comfort? Peace be to this house!"—*W. Jay.*

TELEGRAPH.

There is a telegraphic line between Newhayen and Toronto, in Upper Canada, the route being via New York, Albany, Rochester, Buffalo, then crossing the Niagara river, below the Falls, and passing round Lake Ontario to Toronto—the entire distance of which is nine hundred miles! This is the longest distance yet traversed by electricity in a continuous, unbroken line.

ARITHMETICAL AND MATHEMATICAL WORKS.

W. and R. CHAMBERS have now completed their series of Arithmetical and Mathematical Treatises for use in schools, or for private instruction, as follows:—

Introduction to Arithmetic,	1s 6d
Arithmetic, Advanced Treatise,	2s 6d
Algebra,	4s 0d
Key to Algebra,	2s 6d
Plane Geometry of Euclid, as improved by Simpson,	2s 6d
Playfair, and Bell,	2s 6d
Key to Plane Geometry,	2s 6d
Solid and Spherical Geometry,	3s 6d
Practical Mathematics, two Parts, each	4s 6d
Key to Practical Mathematics,	3s 6d
Mathematical Tables,	3s 6d

The foregoing is respectfully offered as a carefully-prepared series of elementary works on Arithmetic and Mathematics. THE PLANE GEOMETRY has now been published ten years, during which period, from its remarkable cheapness and adaptation to the purposes of education, nearly sixty thousand copies have been sold. To render the work still more deserving of public approbation, a new edition, typographically and otherwise improved, has just been issued.

*** Sold by all Booksellers.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 59 Miller Street, Glasgow; W. & G. 147 Strand, London; and J. M'GLASHAN, 21, D'Oliver Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 237. NEW SERIES.

SATURDAY, JULY 15, 1848.

PRICE 1½d.

THE VERY WISE, THE NEVER WRONG, AND THE INFALLIBLE.

THE Very Wise, the Never Wrong, and the Infallible form a single class of persons, being all marked by one character, only in different degrees. Perfect Infallibles are exceedingly rare: the Never Wrong are more common, but still by no means numerous: Very Wise people are comparatively often met with. This estimate, however, cannot be presented with much confidence, for the characters are sometimes seen shading into each other in a remarkable manner, as circumstances and gusts of mental affliction may determine. Thus a very wise person, after several instances of extraordinary correctness of judgment, becomes for a time one of the Never Wrong; and thus a never wrong person, having an opportunity some day of reflecting on the singular exemption from error which appears in his conduct, begins to feel that he *cannot* be wrong—that he is, in short, Infallible. The regularly Infallible are least liable to variation and shading; yet even they are occasionally known, under a remarkable access of modesty, to feel as if there were, after all, some slight trace of human infirmity about them; so that they may be said, on such occasions, to fall back upon the Never Wrong, or the simply Very Wise. These, again, have also their syncope, throwing them respectively back a very little in the gradation; seldom more than a *very little*. Upon the whole, the three grades or orders appear pretty distinct in society, the variations being too slight and infrequent to affect the case to any important extent.

The Very Wise people are not a people who make much pretension. That were in itself unwise, and therefore inconsistent with the character. It is unnecessary, for, without it, they stand in such a tremendous repute for sagacity, that their character can never be for a moment doubtful. They speak little on any point; but what they do say is always on such sure grounds, that it tells better than the largest and most eloquent discourse. They never talk about their own affairs, but leave you to imagine that these are managed with an accuracy and success not to be paralleled. In making prophetic remarks, they are apt to come behind rather than before the event; a fashion of prediction which answers quite as well with the multitude, at the same time that it is obviously the safest. They are also great on matters which have turned out ill, always showing in the most convincing manner how they might have been managed to a better purpose. Sometimes, without uttering a word, but merely by a look or a quiet smile, they produce such an impression, that the half-hour's argument of an opponent goes for nothing, and the gravest accusations against them are dismissed without farther defence. The fact is, they carry everything by character—but then how is cha-

acter in the first place established? By having no violent tendencies of any kind, by always keeping a low flight in worldly affairs, by never committing themselves to anything. Such being the general conduct of the Very Wise, it may be argued of them that they are a class in some measure exceptive to human nature. They have not the regimental amount of the passions. Fancy, whim, and crochets have been omitted in their composition. So they never, in the ordinary course of life, do any foolish thing, or any great thing, or make themselves very amusing. Neither, of course, are they in general very popular. They rest in a cold abstraction from the common circle, far too well satisfied with their own approbation (which they call the approbation of their own consciences) to heed much for the praise of their fellow-creatures.

It is curious, nevertheless, that all the most absurd things in this world are done by the Very Wise people. Ask who it is that lost the greatest sum by the failure of that ill-conducted joint-stock company, and you find it is one of the Very Wise. Who shipped most largely in '42 for Australia, when everything there was about to go to smash?—why, who but the wisest amongst us! Who was it that married his cook last year, to the discomfort of all his relations, and the infinite amusement of society for the statutory period of nine days?—and the answer is, again, one of the Very Wise. Whose house was that which was burnt down a few nights ago with the insurance just two days expired? Three to one a Very Wise person. Lately, if you had inquired of some super-earthly intelligence which of the sovereigns of Europe was to be, on some approaching forenoon, dethroned, and whirled away ignominiously from his palace in a cab, it would have been answered—the one who passed as above all a wise one. Who was the minister that was to be expelled from his seat in like manner?—a very, very wise one. This is a vexing consideration for the Very Wise people, but a source of vast consolation to the ordinary children of mortality, who like nothing better than to see that qualities which they vainly wish to possess fail to procure certain blessings to those who do possess them. It keeps up the wonderful system of compensation in society, and impresses on all whom it may concern the salutary truth, that we upon the earth here are none of us gods, but only men.

The Never Wrong are very wise persons, with a strong sense of that superiority of perception and judgment on which their reputation is based. The lady who said, 'Well, I don't know how it is, but I am never wrong in anything,' was not properly a Never Wrong person. Had she been, she would not have wondered at it, but seen that it was all in the fair course of things that she made no mistakes. True members of the Never-Wrong fraternity feel that such is their character from

the beginning: it grows with their growth, and strengthens with their strength—so is no more a surprise than it is for the son of a monarch to find himself a prince. Infallibility may be considered as an exaltation of the character, which is the lot of a very few rarely-constituted persons. In the simplest matters of fact they are almanacs and Johnson's Dictionaries; in criticism, quarterly journals; in politics, oracles; in doctrine, popes. They do not converse—they pronounce. Contradiction, in the rare cases where it is ventured upon, is variously received, according to special peculiarities, but the handsome and magnificent way is the compassionate. 'Poor fellow! he thinks so and so. He means well, I daresay, but he knows nothing of the matter. I pity his youth.' Never Wrongs, and Infallibles of less perfect style, bluster; which is unfortunate for them, as it depreciates their reputation. The right man takes all variance of opinion coolly, as something to be expected in the imperfect state of human nature. 'Give them time, and a little more knowledge and experience, and they will see it as I see it, and as all thinking men see it.' 'Oh, my dear friend, it is needless to talk—it was all settled long ago: you are only a little behind, that's all.' Presenting new facts tending to different conclusions is of no use, as it is indeed to present new facts at all, for the true Never Wrong or Infallible can take no such things in: the truth is, it was all settled long ago—in his conceit. It is strange that, nevertheless, these are the people who make the greatest mistakes, and commit themselves to the greatest misjudgments. Who is it that, through the whole of existence, has been remarkable for the false plan of life, or the false code of opinion, or the false theory of science, of business, of criticism, on which he has proceeded?—ten to one an Infallible. It is vexing, but true. One could almost suppose that there was some supernal spite or waggishness in the case, delighting in the ultimate overthrow of such intellectual superbiety, and Jacobinically desiring to see all men brought to a level.

Generally, towards the conclusion of little papers of this kind, I indulge in a few remarks of the nature of a homily. It is of course precluded in this case; for of what use would it be to tell the Very Wise not to be so very wise, or to warn the Never Wrong and Infallible against the errors to which they are liable? They would of course feel that they knew far better than I what they ought to be, and what they ought to do, and how to conduct all the various operations of their own minds. Far be it from me to attempt anything so hopeless as the enlightenment of the ultra-sage, or the correction of a habit of infallibility. I may, however, take occasion to point out the danger to which ordinary people are liable, if they by any chance are led to think themselves approximating to the very wise state, or becoming violently sound and correct in their judgments. The least approach to the condition of having no misgivings about anything, is a real subject for alarm to one who desires his own good in connection with that of his fellow-creatures. When one feels it coming on, he should instantly back sail, examine the chart, and heave the lead. He may depend on it there is something wrong, and nothing but the keenest self-examination and the most determined modesty can save him. In a word, my friends, try to be tolerably wise, but not Very Wise—endeavour to be respectably correct, but tremble at the idea of being Never Wrong or Infallible.

GOOD COUNSEL BETTER THAN GOOD PAY.

A LEGEND OF BRITTANY.

NEAR the village of Elven, on the road leading from Varennes to Ploërmel, in the department of the Morbihan, there lived, about forty years ago, an honest peasant named Trédion, whose amiable and industrious wife Jeanne Marie had made him the happy father of a fine boy and a pretty little girl. Employment having become scarce in that part of the country, and

Trédion having heard it said that high wages were given in the neighbourhood of Fougères, he took leave of his wife, embraced his children, and set off for that place, where he was very soon hired by a rich farmer of the name of Laignelet. The latter was an honest man, who cultivated his land with care; and besides a large flock of sheep, was also the owner of a great number of cows and pigs. His wife was an active, thrifty housekeeper, and God had blessed them with a numerous family.

Trédion had the good fortune to please the farmer, his wife, the children, and indeed every one; so that at the termination of a few weeks Laignelet said to him, 'Trédion, I like the way you do my business. You are a good labourer, and I should wish to keep you with me for some time. Will you hire to me for two years? I promise you sixty crowns at the expiration of that term, and a present of a new coat in addition to the bargain—your board and lodging free—and every Sunday you shall have your pint of good cider: in short, you shall be treated like one of the family.'

Trédion assented to this proposal, and during the two years he neglected nothing which could forward his master's interests. At one moment he was to be seen superintending the labourers digging potatoes, which are so well cultivated in Brittany; at another time working himself, ploughing, harrowing, tending the sheep and cows, or driving the pigs to fairs and markets. For ten leagues round there was not a farm servant to be compared to him. Trédion was not only diligent at his work, but it seemed as if good-luck attended all his undertakings. Consequently these two years appeared very short to all parties. Laignelet feeling that to lose Trédion would be to lose his right arm, resolved to keep him at any cost; therefore, when the day arrived for settling his accounts, Laignelet thus addressed him:—'My friend, I value your services too much to part with you, if you will only remain with me. Re-engage for three years more, and I will double your wages, and give you another new coat. Thus at the end of that time you will find yourself the possessor of a large sum, and can return to your wife, have cows and pigs of your own, and live comfortably and respectably with your family, instead of being obliged to work for others.'

The offer was tempting. The poor fellow consented, consoling himself with the idea that Jeanne Marie would not have disapproved had she been there, and that, in the meantime, she could get on very well with the help of God and of their son, who was ten years old when his father left home for Fougères.

Things went on even better during these three years than during the two first. The harvest was abundant, the wool sold well, the farm prospered in every respect, and gaiety presided at the evening fireside. Trédion, though somewhat superstitious, like all the natives of his province, was an amusing fellow, who bore good-humouredly the laugh which his ingenious simplicity created; and the children liked him because he told them stories in the long winter evenings. No province in France has more legends than Brittany.

Every one at the farm grew melancholy as the termination of Trédion's engagement approached; and to say the truth he felt himself somewhat heavy at heart, though he knew his duty recalled him to Jeanne Marie and his children. Laignelet and his wife, therefore, consulted together, and a few days before the engagement expired—a moment to which all looked forward with such sorrow—the farmer made an offer to Trédion of eighty crowns if he would remain with him but one year longer.

'Remember, my dear friend,' added he, 'that with these six years' wages you will be enabled to bring back to your wife a very large sum; and that with this money not only can you buy cows and pigs, but can also purchase a small house with an acre of land, where you and your family can live in happiness and independence.'

Trédion certainly felt some pang of conscience, but

how was it possible to resist the temptation of securing such a future to himself and those most dear to him? Perhaps at that very moment his children were begging for a few potatoes at the door of some charitable person; but how they would be compensated for all their privations on his returning to them with so much money and two new coats! He engaged, therefore, for a sixth year in Laignelet's service.

This time the months seemed to pass with greater swiftness than before, and everything prospered at the farm beyond even the hopes of its proprietor, who in consequence built a new barn, purchased some additional acres of ground, increased his flock, and what was better than all, attributed the greater part of his good fortune to his faithful servant. Laignelet now determined to make one more effort to keep Trédion for another year. For this purpose he took him aside, repeated all his former arguments, not omitting the new coat and the pint of cider on Sunday, and finally assured him that to the money already due he would add three hundred crowns more at the end of the seventh year, which would then enable him to return home with a fortune!

Never was peasant more tempted than Trédion: however, this time nature triumphed. The desire of seeing his family was stronger than his love of money, and he had the courage to declare that he would prefer returning to Elven. Laignelet could not blame him; and this time he did not try to keep him against his wish, so strongly expressed.

It was easy to see, on the morning of Trédion's departure, that no one had closed an eye the previous night. He remarked that his mistress, the active house-keeper, had not been in bed, but had passed the night in making and in baking bread. They breakfasted in silence, and all were preparing in sadness to wish him good-by, when his master took him into his room and thus spoke to him:—"You have been my servant for six years, and no one ever before served me so faithfully. During all that time I have not missed one farthing in my accounts, and the cider has never once affected your head. Whatever I have paid you from time to time in advance of your wages, you may now keep; it is not too much, when I consider all you have spent on playthings for the children. Ah! how the little ones will miss their good friend Trédion: I hear them sobbing in the next room!" And whilst he thus spoke, honest Laignelet turned aside and wiped away a tear; but he instantly resumed: "Trédion, my good friend, you ought by this time to know me well! I read in your countenance that we understand each other: is it not so? I thank you, then, for your faithful services, and for your friendship." Here the tears rolled down Trédion's cheeks, for he could no longer control his feelings. "Come, come," said Laignelet, "dry up your tears, and let us speak of business. Have you confidence in me?"

"Confidence in you, master!" exclaimed Trédion. "Oh, most certainly!"

"Will you, then, listen to the good advice I am about to give you before starting?" added Laignelet.

"Most willingly, master; and I promise you to follow it strictly."

"What would you say if I begged of you to accept my good counsels in lieu of the money I owe you; and if I persuaded you that, on arriving at home, you will admit that you had been a gainer by the bargain, will you not be satisfied? Now let me know if you really have confidence in me: do you accept my advice in place of your money?"

This question upset all Trédion's calculations. He had often heard such and such a farmer praised for the good advice he gave his servants; he knew it was customary to pay large sums to lawyers, whether their counsels were good or bad; he had also been told that neither the kings nor queens of France could decide on anything serious without consulting advisers, whom they paid highly. He considered Laignelet on a par with any of these counsellors, and had unlimited con-

fidence in him; yet he did not esteem him so much as to prefer his advice to good coin of the realm; therefore, after a few moments' reflection, he replied—"To say the truth, master, I am quite taken by surprise." Then making an effort to laugh, he added in a rather awkward manner—"Ah, I see how it is; you are joking, master. But no matter—it is better to laugh than to cry: still I should prefer my money, unless—"

Trédion could not conceal his anxiety to unravel this mystery, especially when he saw that Laignelet did not join in the laugh, but still tried to persuade him in the most serious tone.

"You are now leaving me," said he, "after having served me for six years, and have every right to the money you have so well earned. Do you think I could look you straight in the face if I intended to deprive you of one single shilling?"

"But, sir," replied Trédion, "how am I to look my wife and children straight in the face when they ask me for the money I promised to bring back from Fougères?"

"I know what is passing in your mind," answered Laignelet; "but I again assure you that if you accept my advice, you will soon be as happy with your family as I am with mine; nay more, you will arrive at Elven richer than you now are. But if, on the contrary, you unfortunately decide to put the money I owe you (and which I am ready to hand to you this moment) into your pocket, the charm will be broken, my advice will be of no avail, and you will reach home as poor as when you left it. Take, therefore, the advice I am willing to give you in place of your money, otherwise you will repent as long as you live."

Trédion still hesitated, twisted and turned in all directions, and looked up to heaven, as though he expected some good genius would fly down to free him from his embarrassment; but Laignelet, who was resolved to make him accept the bargain, anticipated all objections by saying, "I know your thoughts, and it is not kind of you to doubt your old master's word; but I so sincerely wish your welfare, that I am determined to persuade you to follow my advice. I once more repeat, that it will be a great misfortune if you decide to accept your money, and refuse my advice. But if, on the contrary, you place entire confidence in me, and if, on arriving at home, you are not delighted with your bargain, you have only to come back and serve me for another year, and I will add a hundred crowns to the sum I already owe you."

Trédion could no longer hold out against this tempting promise, and the perfect confidence he felt in his master finally decided him; while, half in hope and half in fear, he declared his willingness to accept—*advice in place of money.*

As soon as Trédion had consented to the bargain, the farmer begged of him to sit down, and to pay the greatest attention to what he was about to say. "Listen to me most attentively," added he; "for unless you adhere strictly to my advice, I much fear you will pay dearly for your negligence; whilst, on the other hand, if you follow it to the letter, you will soon be one of the happiest of men."

"I am all attention, sir," replied Trédion.

"*Advice the first,*" began Laignelet: "in returning home, never leave the high road; avoid all byways; and though the distance may be shorter, never go through a wood. Do you understand me?"

"Yes, sir," answered Trédion. But he could not help muttering to himself, "If the second piece of advice be no better than this, my money is well invested!"

"*Advice the second,*" continued Laignelet: "if you stop in a strange house, especially at night, look around you well; and if you find that the master of the house is old, and the mistress young, leave it as fast as possible, and on no account sleep there. Will you recollect this advice especially?"

"Sir, I know it by heart," replied Trédion; again muttering to himself, "If I could find any one to accept of

my bargain at the same price, I would give it up to him this moment.'

But there was no retreat; he felt that he had nothing for it but to make the best of his bargain. He now thanked his master, and was about to go without asking another question, when the good woman of the house came into the room with the children, and M. Laignelet, taking Trédion by the hand, said, 'What do you mean by running off in this way, my good fellow? To set out without any provisions for your journey! Water is everywhere to be found instead of cider, but bread is not to be had so easily. My wife stayed up last night to bake, and has provided for all your wants. Take this large loaf under your arm, and eat it on the road; but put the small one in your pocket as a present from us to your good wife Jeanne Marie. When she tastes it, she will tell you there is no bread made like it in all Brittany. I will put it myself into your pocket. What! no button? Here, wife!—a needle and thread: sew up that pocket, or Trédion will lose his loaf.'

When the pocket was strongly stitched, every one embraced Trédion, and he bade them all a sorrowful farewell. The poor fellow was so affected by the grief of the children that he almost forgot the bargain he had made.

We shall not relate the various thoughts which troubled poor Trédion the first day of his journey: one moment accusing himself of idiocy, the next doubting his master's good faith, and then again trying to discover some cabalistic meaning in advice which had cost him four hundred crowns. The first evening he stopped at the cabin of a shepherd, who cheerfully shared his supper with him. The following morning he continued his journey, and in a little while fell in with two pedlars, who carried their wares on their back, and were on their way to the fair of Montfort. They travelled on together for some distance, and the mirth and gaiety of his companions put all Trédion's melancholy reflections to flight; but when they began to praise their goods, and begged him to examine them, his hand involuntarily sought his pocket, and his grief redoubled on finding it so empty. Still he was rich enough to spend fifteenpence on the purchase of a pair of scissors for his wife!

They soon afterwards arrived at a turn of the road leading from Montauban to Hedes, and one of the pedlars interrupted the conversation by saying, 'This must be the fingerpost they spoke to us of at the hotel last night, and this is the path which will save us two good leagues to Montfort.'

'It is the very one,' replied the second pedlar. 'Come, let us go this way, as it is the shortest.'

Trédion, as precious of his time, and as anxious to spare the soles of his shoes as his companions, was just about to follow them, when his master's advice recurred to him, and he stopped short that instant, repeating to himself, '*When you are returning home, always keep on the high road; avoid byways; and, above all, never go through a wood, though the distance may be shorter.*' He had paid too dearly for this advice not to follow it implicitly; so he bade the pedlars good-by, and walked on straight before him.

Nothing remarkable occurred until he arrived at Montfort, where, to his surprise, he found the two pedlars sitting at the door of a hotel, their clothes torn, their faces bruised, and telling every one of the way they had been used. They were still so agitated, that they could with difficulty answer Trédion's anxious inquiries; but when they did speak, they told him that the pathway they had chosen led them into the middle of a wood, where six men, armed with sticks, and their faces blackened, lay in wait for them; and not content with robbing them of their goods and all their money, had cruelly beaten them into the bargain. They fancied they recognised amongst these robbers the voice of the man who the day before had recommended them to take this short cut. Trédion consoled them as best he could, whilst he secretly congratulated himself on

having so opportunely remembered the advice of his master; for, though little richer than the pedlars now were, he at least had escaped being beaten. Unable to render them any further assistance, he took leave of the pedlars a second time, and pursued his journey. He stopped, but, lo! and that at a spring of clear water, when he sat down on the grass, ate a portion of his large loaf, drank from the well, thanked God for having preserved him from the first dangers of his journey, and then, feeling much refreshed, walked on until evening.

The sun was setting when he reached the boundaries of the department of the Ille et Vilaine. He hoped to go on to Pielan, where he had an acquaintance, a shepherd, who would have welcomed him to his cottage; but it was even then dark, his limbs were failing him, and he saw with no small pleasure a light twinkling through the windows of a large farm-house. Here he determined to ask lodging for the night; he knocked at the door, and entering with the customary salutation of Brittany—'God bless you!—' was well received by a young woman, who asked him to walk into the kitchen; for the frank hospitality of ancient times still lingered in Brittany. Trédion, therefore, seated himself without much ceremony in the chimney corner, beside a good blazing fire, lighted his pipe, joined in the conversation of two or three travellers, who, like himself, had sought shelter beneath this hospitable roof, and partook of a supper of fine potatoes and vegetables served up again after.

Everything in the house bore evidence of plenty and comfort. Large fitches of bacon hung in the chimney; on a large dresser of walnut wood stood a service of bright pewter, mixed with a few china plates, and some drinking glasses, which latter are looked upon by the farmers of Brittany as a sign of wealth and luxury. The lowing of the cows and the grunting of another species of quadruped no less familiar to Trédion's ear, reminded him of the farm where he had worked with so much diligence for six successive years. He looked round for the host and hostess of the house; he saw only the young woman who had received him on entering: she was very handsome, and very comely dressed, but, apparently, uneasy in her mind, was continually walking to and fro, and every moment stopping to look at the clock, as if she wished to make the hands move faster. Near him sat two travellers, honest-looking fellows, who, from their conversation, he soon discovered to be farmers on their way to the fair at Montfort, and who had but just arrived a few minutes before himself. They knew the owner of the house only by name; he was then absent, but was expected home every moment. A gray-headed old man soon entered, and bowing good-naturedly to every one, expressed a hope that they were all comfortable. His venerable and respectable appearance was most striking; and when the young woman advanced towards him in a most coaxing manner, Trédion at once thought, 'that must be her father!' but on a question to the servant-girl, she whispered him, 'He is her husband!' The young wife and the old husband retired together, arm-in-arm. Laignelet's second piece of advice respecting an old husband and young wife now flashed across Trédion's mind. Starting up from his seat, and taking advantage of a moment when the attention of the others was engaged, he glided softly towards the door, and without wishing any one good-night, left the house.

The night had grown stormy. Trédion roved for some time round and round the farm, and at length entered a shed filled with sheaves of corn, desiring to reach the high road before morning, and anxious for a little rest, he laid himself down in a corner of the shed, and closed his eyes; but he could not fall asleep as quickly as was his wont, his mind being too much disturbed by the occurrence of the three preceding days, and more especially by his own escape from the misfortunes of the pedlars. Laignelet's second piece of advice occupied his thoughts still more, though he

could not as yet understand what danger he should have incurred by remaining near the good fire in the kitchen. Silence reigned all around, and everything betokened how little annoyance the rain caused the guests who had found shelter beneath the hospitable farm-house. The lights which shone through the windows disappeared one after another, and every one seemed to have gone to rest.

'Who knows,' said Trédion to himself, 'but that my foolish terror may have deprived me of a comfortable bed, which doubtless would have been offered to me after supper?'

At that moment he heard a noise—the trampling of a horse—he listened, and suddenly it stopped under the shed. Peeping out stealthily, Trédion saw a young man dismount, fasten the bridle to a post, throw his dark cloak across the saddle, and putting his hand in his belt, draw forth a pistol, which he the next instant proceeded to load. Terrified at this sight, poor Trédion buried himself under the sheaves of wheat, not daring to look out again. Fortunately the horse was standing between him and this mysterious personage. The latter, believing himself alone, advanced a few steps in front of the shed. Trédion, now breathing more freely, ventured once more to raise his head: he had scarcely done so, when a gentle knock at one of the windows was immediately answered by the appearance of the figure of a woman from within, holding a light, thus proving that the robber—if he was one—had an inmate of the house as an accomplice. Trédion trembled but the more at this discovery: still, summoning up all his courage, he crawled along close under the house, and kept not one word of the following dialogue:—

'It is I, Madame,' said the man. 'I am come, according to promise, to rid you of your husband, and to send you another—one not forced on you by relatives. Have you taken care that suspicion of the crime shall rest on some one else?'

'Chance has served us better than my prudence,' answered she. 'Some strangers arrived to-night, and have remained to sleep. We can easily accuse them, and have them convicted.'

'May I then go in and follow you?'

'Come, and leave the rest to me.'

Here they both ceased speaking; and the man having climbed in by the window, it was instantly shut after him.

As may be imagined, Trédion's palpitations increased not a little. However, he had not as much courage as honesty; or he would have roused the house by a cry of murder. His conscience reproached him with cowardice, still cowardice prevailed. He fancied the slightest noise would draw down on himself the vengeance of the assassin, whose figure he magnified into that of a giant.

'I shall be one victim the more,' thought he; 'but at least I will provide myself with undeniable proofs against the author of this crime, which I cannot prevent.'

Trédion took the scissors he had bought from the pedlar as a gift for his wife, and cut out a small piece of cloth from beneath the collar of the cloak which had been left on the saddle, and then with the point of the scissor's pierced three holes in the bridle, but so small, that it was not likely they would be noticed. Having taken these precautions, he was creeping away from the shed, when he heard a heavy groan, which went to his very heart; but once on the high-road, he quickened his pace, and was soon out of sight and hearing.

That same morning, before sunrise, Trédion crossed the boundaries of the department of the Ille et Vilaine, not more than ten leagues from his native village. From that moment he felt renewed strength animate him, and at six o'clock that evening he beheld the smoke rising from his humble home. Oh what happiness! Jeanne Marie was standing at the door looking along the road, and instantly recognising him, she flew with the children to meet him, and all embraced with glad and tender affection.

After a while, Trédion thought it proper to explain matters; but when he announced that he returned with his pockets almost empty, the family were thunder-struck, and Jeanne Marie had the cruelty to receive the present of the scissors without one word of thanks. The good woman could scarcely believe that Trédion was telling the truth, and begged him to relate all his adventures in detail. He did not require to be asked twice; and commencing from the first day he left them, ended by repeating word for word the advice given by the farmer of Fougères in lieu of his money.

'So this is all you bring back to us for your six years of labour and absence?' said Jeanne Marie, interrupting her husband. 'Is it possible you have returned empty-handed?'

This reproach reminded Trédion of the second loaf of bread.

'It's quite true,' said he; 'but I forgot that Madame Laignelet sent you a loaf of bread made with her own hands.'

His pocket was soon opened.

'Let us see,' said Jeanne Marie, 'if the women of Fougères bake better bread than those of Elven.'

Trédion's children leaped with joy at the sight of the white bread, so superior to the coarse oat cakes they were in the habit of eating; but nothing could equal their surprise when, on cutting the loaf, the knife brought to light a purse containing fifty guineas, and a letter, the contents of which were spelled over by Trédion's son, and were as follows:—

'My dear Trédion—I trust this letter may reach its destination in safety, as it is intended for the messenger who carried it. Credulous and obliging as we know you to be, you would have run the risk of arriving at home as poor as you left it, if I did not force you to accept the advice given for nothing, although it really was worth the fifty guineas you were supposed to have paid me. It is not sufficient to have money, my dear Trédion; we must also know how to employ it. Make good use, therefore, of what you now possess; and that God may bless you, is the wish of your old master, LAIGNELET.'

On finishing the perusal of this letter, Trédion and his wife fell on their knees to pray God to return a hundredfold the blessings with which it concluded. Jeanne Marie's curiosity having only been suspended by this incident, her husband was obliged to continue his story for her satisfaction, relating, not without a shudder, the history of the pedlars who had been robbed and beaten, and the mysteries of the past night, in which Trédion had so narrowly escaped being charged with such a horrible crime. How precious did Laignelet's advice now seem to Trédion's poor wife!

Prudence sometimes accompanies riches. Trédion and Jeanne Marie after again and again consulting over their gold, decided it was better to keep silent as to his adventures and his happy return, in order not to tempt the cupidity of their neighbours. It was only at the expiration of a few months that they employed the money, as Laignelet had advised, in the purchase of two fine cows, six pigs, and a pretty little cottage, with some land adjoining. Trédion felt very anxious to know what had occurred at the farm-house from which he had so narrowly escaped, and especially what had become of the two travellers he left there. The clergyman of the village alone appeared a safe confidant, and to him, after some time, he went, and gave an exact account of all he had seen and heard on his journey homewards.

'Wretched man!' cried the priest; 'through your fault two innocent men may be condemned to death. The trial is to come on to-morrow.'

'God forbid!' exclaimed Trédion in terror. 'What am I to do, sir?'

'Have you kept the piece of cloth?' asked the clergyman.

'Here it is, fastened by a pin to the lining of my coat,' replied Trédion.

The clergyman then wrote a note, and giving it to

Trédion, said, 'You must set out at once for Rennes in my carriage, and not stop on any account until you reach the gate of the court-house. Then send in this note to the judge, with whom I am acquainted; he will have you instantly summoned, and confront you with the jury, the prisoners, and the real culprits. Go now, and remember that you are the bearer of a decree which may save from death two innocent men.'

The next day, about two in the afternoon, the clergyman's carriage drew up before the court-house at Rennes, and in a few minutes afterwards Trédion was standing in the presence of the judge.

In truth that very day two men were to be tried for having entered the house of a rich farmer, and having murdered and robbed him while asleep. The accusation had been borne out by the young wife of the victim, who had made her declaration with the greatest confidence. According to her statement, the two murderers had fastened her to the bed-post, gagged her mouth, and bound her eyes, in which state she had been found next morning by the servants of the house, who instantly gave the alarm in the neighbourhood. The two prisoners, on whose persons had been found a purse filled with gold belonging to the murdered man, affected utter ignorance of the whole affair; but proofs were clear against them, and the defence made by their lawyer, eloquent though it was, only tended to confirm the court in the conviction of their guilt. After an hour's deliberation, the jury had that moment returned to pronounce its verdict, when the judge (to whom a note had just been handed) with some agitation addressed them, and said, 'Gentlemen of the jury, an extraordinary circumstance has occurred: a new witness has, without any summons, this moment arrived, and he declares his readiness to make a deposition in favour of the accused. I should deem myself unworthy of the post I occupy did I not request you to suspend your decision, which might one day prove both to you and to me a source of remorse.'

The judge then sent for Trédion, to whom the usual oath was administered, and he was desired to ascend the table. Every one present remarked the effect produced on the young widow by the entrance of this witness. She was seated near a tall young man, with whom she had frequently held counsel during the course of the trial. She now looked at Trédion, whom she at once recognised, in evident agitation; whilst he, encouraged by the prisoners' lawyer, spoke out boldly and clearly.

'My lord,' said he, 'before giving my testimony, I must request you will order the doors to be closed; for I am very much mistaken if the real culprits be not here present.'

At these words the young woman covered her face with her handkerchief, and the young man buttoned up his cloak. Trédion then began his narrative, and the murmurs of approbation from the audience proved that his testimony was believed: acquiring confidence, and becoming almost eloquent as he went on, he turned round towards the guilty woman, and pointing to her, said, 'There is she who came to the window to speak to the stranger: I should recognise her even better if she would say a few words in a low tone to the man who is sitting near her; for that man is the assassin himself: I know him by his figure, by his cloak, of which I kept a small pattern—here it is! Examine if this little bit of cloth be not wanting under the collar!'

This singular accusation, and this proof, of which they had not until now the remotest suspicion, filled the culprits with terror. While the jury were examining the cloak, Trédion added, 'Let this man also produce the bridle of his horse; and in it you will find three little holes made by me with the point of a pair of scissors.'

Trédion had proved enough: the assassin did not try to deny it; his accomplice fainted; and the farmers raised their hands to heaven, to thank God for their miraculous escape from an ignominious death.

The court broke up, and new proceedings were instituted against the true culprits, who were put into prison to await their trial: it took place three months later, when they were both condemned, and executed in the market-place.

Trédion for the moment was the 'lion' of Rennes. But he soon set off for home, paying a visit on his way to the farmers whose lives he had saved. He and his wife ever after lived in happiness and comfort, and brought up their children in the love and fear of God, often repeating to them that 'Good Counsel is better than Good Pay.'

SKETCHES IN NATURAL HISTORY.

TORPIDITY OF ANIMALS.

THE absence of the means of support for some animals in certain countries during winter leads to various expedients of nature, which cannot be contemplated without great interest. One of the most noted of these expedients is migration—the removal of the animals in a body at the approach of winter to climes where they are sure of obtaining food. Another is the falling of the animals into a state of torpidity, during which, there being nearly a total cessation of waste, nutrition can be dispensed with. The most noted sleeping animals, as they may be called, in our country are by no means low in the scale, being members of the highest vertebrate class—mammalia. The highest of these is the bat, which, while believed by the vulgar to be a kind of bird, is placed by naturalists very near our own species. The other sleeping mammals are, however, comparatively low in their class; there being of rodents, the hamster and dormouse; and of insectivora, the hedgehog and tenrec. No peculiarity of organisation has been detected as leading to this state. It appears to depend wholly on the external temperature. When the animal is kept in a warm place, and duly supplied with food, it passes through its usual sleeping period in a state of sufficient liveliness.

It is at the approach of cold weather, at the fall of the year, that the sleepers withdraw to places of safety, where they may pass the winter undisturbed. 'The bat retires to the roof of gloomy caves, or to the old chimneys of uninhabited castles. The hedgehog wraps itself up in those leaves of which it composes its nest, and remains at the bottom of the hedge, or under the covert of the furze, which screened it during summer from the scorching sun or the passing storm. The marmot and the hamster [creatures much resembling the rat] retire to their subterranean retreats, and when they feel the first approach of the torpid state, shut the passages to their habitations in such a manner, that it is more easy to dig the earth anywhere else than in parts which they have thus fortified. The jumping mouse of Canada seems to prepare itself for its winter torpidity in a very curious manner, according to the communications of Major-General Davies, on the authority of a labourer. A specimen, which was found in digging the foundation for a summer-house in a gentleman's garden about two miles from Quebec in the latter end of May 1787, was "enclosed in a ball of clay, about the size of a cricket ball, nearly an inch in thickness, perfectly smooth within, and about twenty inches under ground. The man who discovered it, not knowing what it was, struck the ball with his spade, by which means it was broken to pieces."—(*Linnean Transactions*, iv. 156.)'

In the torpid state, the temperature of the animal's body sinks to about that of the surrounding medium. For example, it has been observed to go down from 100 to 43 degrees of Fahrenheit; but the exterior of the body is colder than the interior. The breath is drawn at long intervals; digestion is entirely suspended, circulation nearly so. The irritability is so much reduced, that parts of the limbs of the animals may be cut off without their giving any signs of feeling. A shock of electricity failed to rouse a dormouse. Experiments have shown that the hibernating animals in a perfectly torpid state consume no oxygen, and can live in an air which will not support either life or combustion.*

Reptiles, in as far as their sensibility to cold is greater than that of mammals, are more liable to fall into torpidity when exposed to the necessary conditions. It is well known that the frog and toad in this country spend the winter in slumber. Serpents and tortoises fall under the same rule in all countries where the temperature is sufficiently low. Aquatic reptiles, when about to hibernate, sink into the mud, and there repose for the season, the alligator previously stopping up its mouth with a pine or cypress knot. Land reptiles, again, withdraw into crevices of rocks and hollows in the ground, taking care that these are so situated as to promise protection from enemies. It is not known that any fishes hibernate; the usually equable temperature of the water may make this less likely to take place; but it is known that they are capable of that entire suspension of life which occasionally takes place in reptiles under the influence of frost. 'The fish froze,' says Sir John Franklin in the Narrative of his Journey to the Polar Sea, 'as fast as they were taken out of the nets, and in a short time became a solid mass of ice, and by a blow or two of a hatchet, were easily split open, when the intestines might be removed in one lump. If in this completely frozen state they were thawed before the fire, they recovered their animation. We have seen a carp recover so far as to leap about with much vigour after it had been frozen for thirty-six hours.' Toads have been in like manner frozen, so that their limbs might be broken off like pieces of glass without a drop of blood flowing, and yet, on being thawed, they survived.

Snails are amongst the most noted of the invertebrate animals which thus occasionally withdraw from the whole business of existence. Seeking some quiet crevice or nook, they retire into their shells, draw to the operculum as a sort of door, thus closing up their house, and then go to sleep. It is remarkable of them that they can become torpid at pleasure, and independently of temperature. Bees, as is well known, fall into utter insensibility under a low temperature, and readily revive when properly warmed. Spiders spend the winter sleeping in the corners of their webs. The cricket, which has been ascertained to be as liable to torpidity under cold as any other insect, is remarkable for its systematically avoiding this fate in winter by migrating—for it is a migration—to warm kitchens, bakehouses, and cottage firesides, 'where it multiplies its species, and is as merry at Christmas as in the dog-days.'†

Some of the infusory animalcules have been found liable to suspension of life when merely dried. There are certain species which usually live in the mosses and gutters of house-tops. In summer, when the moss and the dust collected in the gutters become perfectly dry, it may be for months, the animalcules are dried up too, and lose every sign of life. Let a shower come, and they revive. In like manner the so-called 'eels' of mowed corn, after lying dry, and to all appearance dead, for a long time, will come to life again on the application of a drop of water. Moisture has revived some animalcules after a torpidity of twenty-seven years. Of late years, it has been ascertained that animalcules, after being dried in the usual way, may be subjected to a temperature far above that of boiling

water (284 degrees), and yet they may be restored to life by means of water.* It was once believed by naturalists that certain birds, the swallow in particular, hibernated at the bottoms of pools. This is now generally discredited, though not by all naturalists (see 'Fleming's Philosophy of Zoology').

Torpidity is regarded by an eminent French naturalist, M. Geoffroy St Hilaire, as 'a state of neutrality between life and death, into which certain animals are plunged in consequence of the stoppage of respiration, when it takes place under certain circumstances.' It seems but reasonable to infer that animals, while in this state, make no progress towards decay; the time during which it lasts appears to be no deduction from the ordinary or proper term of their lives, but simply something over and above. As far as observation goes, it is a state to which there is no necessary termination, apart from a change of the circumstances which have led to it. Thus if the fish caught by Sir John Franklin had been kept in ice for any number of years, we may presume that they would have been as likely to revive at one time as another, and when they did revive, would have the same prospect of life before them as if they had never been congealed at all. There is reason also to suppose, with regard to at least some of the torpid animals, that if they be entirely shut up from the external air at the time when the temperature changes, and the torpidity consequently ceases, they will remain alive so long as the air is excluded, though probably in a dormant state; and in such circumstances also, the ordinary processes of life being suspended, there is no necessary termination to the existence of these animals, any more than if the paralyzing cold had been continued.

It is difficult at least to account otherwise for the discovering of live toads and other reptiles in full-grown trees and blocks of sandstone and coal, of which there are so many instances on record; while, on the other hand, this supposition affords us an easy key to what has hitherto appeared a great mystery. Such facts are indeed disbelieved by many scientific men; but for the disbelief there is no ground whatever, except the difficulty which has been felt of accounting for the facts.

M. Hubert, professor of philosophy at Caen, attests, in the volume of the French Academy for 1719, the finding of a live toad completely enclosed in the heart of an elm of the thickness of a pretty corpulent man; 'a more firm and sound elm,' he says, 'never grew.' In 1731, M. Leigneu of Nantes laid before the Academy an account of a toad being found alive in an oak of still greater thickness, and which, from appearances, he thought must have been a prisoner for eighty or a hundred years. So familiar is this kind of fact in England, that, according to Mr Bree,‡ woodmen, when their axe rebounds against an unusually hard part of a tree, are accustomed to say a toad must be concealed there, the animal being always surrounded with a hard case. It is not difficult to understand how the toad 'gets there.' When about to commence its winter sleep, it retires into any convenient hole it can find. Many take to crevices in trees. It is ascertained that this animal can squeeze itself through a very small aperture, in order to get the desired accommodation. Suppose that this is so small as to be too much grown up before next spring to allow of the escape of the animal, there is no doubt that the toad must remain a captive. It is known to be able to survive a long time in its ordinary state without food. Suppose that the next twelvemonth closes the aperture entirely, there we have the toad consigned to a vitality for which there is no necessary end but the destruction of its prison. Mr Jesse throws some light on this subject. 'I remember,' says he, 'some years ago getting up into a mulberry-tree, and finding in the fork of the two main branches a large toad almost imbedded in the bark of the tree,

which had grown over it so much, that he was quite unable to extricate himself, and would probably in time be completely covered over with the bark. Indeed there seems to be no reason why, as the tree increased in size, the toad should not, in process of time, become imbedded in it, as was the case with the end of an oak rail that had been inserted into an elm-tree which stood close to a public footpath. This being broken off, and grown over, was, on the tree being felled and sawn in two, found nearly in the centre of it.*

The instances of toads found in blocks of stone are so numerous, that even a reasonable selection of them would be tiresome. Many have been authenticated in a manner which, for any ordinary kind of fact, would admit of no dispute. The celebrated Ambrose Pare saw a block split from which a live toad came out. In many cases, although only workmen were present at the discovery, the two pieces of the block remained, with their respective portions of the cavity, to testify the truth to all eyes. Mr John Murray says, 'I have a toad in my possession, preserved in spirit of turpentine, taken from a cavity of the solid rock upwards of 200 feet deep: the space was quite sufficient to contain the body of the animal, and the gentleman who presented the specimen to me saw it alive forty-eight hours after its detachment from the rock.'† In February 1845, a live toad was liberated from a piece of shale in the Pendarran works, Glamorganshire. It was of large size, but weak; it had no vision or feeling in its eyes, and a membrane covered its mouth, so that no food could be given to it. Its spine was also crooked, apparently in consequence of the confined space in which it had lain. Its continuing to live without a breathing aperture is no marvel in this animal, for the skin of the toad may be said to be one universal lung for the arterialisation of the blood.

Dr Buckland some years ago made a number of experiments, in order to prove that toads could not long survive in such circumstances. They were conducted with an absence of ingenuity quite surprising in such a person. He enclosed a number of toads in compact sandstone, and a number more in porous limestone, and buried them under three feet of earth in his garden. After upwards of a year he took them up, when those immured in the sandstone were found dead and rotten, while those in the porous limestone were alive, but much emaciated; from which he inferred that it is impossible for toads to continue long alive in a state of complete abstraction from air and food.‡ It does not seem to have occurred to the experimentalist that the alleged confinement of toads in blocks of timber and stone might have commenced while they were in a state of torpidity, and that the change of temperature taking place where no means existed for the resumption of waking and active life, the animals would probably sleep on *ad infinitum*. The nicety of conditions required in such experiments is shown by what M. Geoffroy St Hilaire ascertained in the course of some which he made in the freezing of toads. He found that the animals only survived when the freezing was effected slowly.

For some time there existed a geological objection to the alleged discovery of toads in stones—namely, that they were often said to be found in rocks so low as the carboniferous formation, a part of the series antecedent to the existence of reptiles. This objection, however, is now removed; for so many batrachian fossils and footsteps of batrachians have latterly been found in this formation, that the existence of toads at that epoch can no longer be doubted. We observe that Mr Lyell has lately given in his adhesion to this doctrine.

We contemplate, then, the discovery of these prisoners of the ancient world as standing in an interesting connection with that suspension of animal life usually

recognised under the names of torpidity and hybernation. Apart altogether from the extraordinary consideration that here we see living animals whose age is to be numbered by millions of years, which have survived the age of ichthyosaurs and pterodactyles, and to which the birth of the mammalian tribes was but as a passing event in the midst of a mighty series, these emancipated captives might be well worthy of the attention of naturalists, and particularly that class who devote themselves to the study of the fossil species. They are almost always described as in some way peculiar. For example, one found some years ago in the limestone of Carruber quarry in Linlithgowshire, was reported to us as having six toes. Now we know that the batrachian order have at this day a rudimentary sixth toe (see 'Rogee's Physiology'), a fact at once supporting the authenticity of the report, which came only from labouring men, and showing how much we may lose in science by continually rejecting and neglecting everything for which we cannot readily account.

VISIT TO THE CHINESE JUNK.

ONE of the latest and most interesting sights of London has been the Chinese junk. The walls, omnibuses, and steamers have all concurred in placarding the Chinese junk—and as everybody has gone to see the Chinese junk, we went to see it also. A quarter of an hour by the Blackwall railway brought us to the remote extremity of the East India docks, in a recess of which, within a kind of paling, to secure privacy, lay the object of our curiosity.

Getting within the enclosure, we see before us this very odd-looking craft, as if it were run ashore on the beach; a short platform giving access to its deck. The first appearance is startling. The whole thing has the aspect of a monstrously large toy-ship; for besides being painted with divers gaudy colours, the sides are decorated with figures of dragons and other fierce creatures, designed, as may be supposed, to inspire terror in those who attempt to capture the vessel. In point of size, the junk seems to be of the dimensions of a brig of about seven hundred tons; but from the clumsiness of her build, and the heaviness of her timbers, we should doubt her capability of carrying a cargo of that weight. The stem and stern rise so high above the level of the mid part of the deck, that the shape approaches the crescent form—a half-cheese well cut down in the middle; and to complete the resemblance to the last-mentioned article, she has not, as we understood, any keel. The junk has three masts, not connected by ropes with each other, as in European vessels; and each mast is furnished with a yard, to which a sail is attached. On the top of the highest is a vase in the shape of an imaginary fish, the body formed of rattan wick, the head and gills made of painted matting, with two projections to serve as antennas, and to the tail are fixed long streamers. The rudder is composed of enormous large timbers, and furnished only with a tiller or long handle: it requires as many as fifteen men to move it when the helm is sunk to its extreme depth in the water. At the stem, or front part of the vessel, are hung two anchors made of iron wood, each consisting of several pieces lashed together with bamboo. With a sailing apparatus so very primitive, it is difficult to see how the vessel could perform a voyage from China to England; and from the account given, the enterprise was attended with much trouble.

The junk, which is called the *Keying*, is not a new vessel; it has been many years engaged in the Chinese coasting-trade, and was purchased for the purpose of being brought as a curiosity to Europe. Considerable

‡ Edin. New Philosophical Journal, April 1832.

address was required in the negotiation, as well as getting her safely past the Bogue forts. Captain Kellett commanded her; and assisted by a crew of thirty natives and twelve English seamen, with the officers, he has the merit of navigating her to England. She left Canton on the 19th of October 1846, rounded the Cape on the 30th of March 1847, and anchored at St Helena April 17th. Here, to the amusement of the islanders, she remained till the 23d, and then put to sea. The intention was to proceed direct to England; but the pitiful state of the crew, and the shortness of provisions, compelled the commander to steer for America, and she arrived at New York on the 9th of July. After being exhibited at that city and at Boston, the Keying departed for England on the 17th of February 1848. On the 15th of March she reached Jersey, whence she was towed by a steamer, and arrived in the Thames on the 28th—the whole voyage, including the different stops, occupying nearly a year and a half. During the voyage in crossing and recrossing the Atlantic, she proved herself an admirable sea-boat—that is to say, she stood out sundry violent storms and buffetings of the waves in a very surprising way. Her sailing capacities, however, were proved to be most imperfect: when there was anything like a head wind, she went to leeward. How she survived the tumbling about in the angry waters, becomes intelligible on a slight inspection. Besides the vast quantity of wood interiorly, there are twenty huge water-tight chests which form part of the fixtures, and by these means she is always pretty secure against sinking. We may now step on board, to have a look at the deck and cabins.

On going on board, we are surprised at the little standing or walking room on deck. From a limited clear space in the middle, stairs ascend to the higher portions fore and aft, far above our head. Large beams, gaudily painted, meet the eye everywhere; and before us, on one side of the vessel, is an erection forming a galley or cooking-house, which seems a monstrous incumbrance. Within this cooking-house there are two large pans, fixed on brickwork furnaces, which open outside. Beneath the openings to the furnaces is a trough or fosse sunk in the deck, which being filled with water to receive the cinders that fall from the furnaces, the risk of fire is avoided. We now descend to the saloon, which is half sunk below the deck; and half raised to form the first storey in the elevated poop.

The saloon is thirty-two feet long, twenty-eight broad, and fifteen and a half feet in height. Detracting from this spaciousness, however, there are two beams traversing the length of the apartment, breast high, as if to bind the vessel in this direction; so that in crossing from one side to another it is necessary to stoop twice beneath these uncouth stays. With this exception, the cabin is tastefully arranged; its sides and ceiling are painted yellow, and plentifully covered with paintings of birds, flowers, monkeys, &c. On the sides there are also hung some Chinese paintings in frames and musical instruments. From the roof depend a number of lanterns of fanciful shape and variegated colours. The Chinese, as is well known, are remarkably fond of lanterns and lamps; and as a regulation of police every person is bound to carry one after night-fall. To such an absurd length do they carry this custom, says a printed account of the Keying, 'that when one of the batteries, which had fired upon the "Albatross" in her passage up the Bogue, had been silenced by a broadside, and the soldiers who had manned it fled in the greatest alarm, instead of endeavouring to escape in the darkness of the night, each man seized his lantern and climbed up the steeples behind the fort. The great lighted and painted balloons which they carried formed a most excellent mark for some of our marines as might wish to fire at the retreat-

ing Chinnamen, all fear of the consequences being forgotten in the practice of their daily, or rather nightly custom.' The saloon contains a round central table of beautiful inlaid wood, and a number of seats of equally tasteful construction. But the most remarkable piece of furniture is a cupboard-like shrine at the inner extremity of the apartment. This is a Joss-house, as it is called by the Chinese, from the Portuguese word *deos*, for god or deity, which they have ingrafted on their language. The Joss-house, which has a considerable resemblance to a Punch's show-box, contains in a sitting attitude the idol Chin-Tee, which is carved out of a solid piece of camphor-wood, and richly gilt. The odd thing about this female deity is, that she has eighteen arms, which spread out like a fan on each side, and in each hand is held an object in ordinary use, as a flag, an arrow, a bow, a flower, a bell, &c. The goddess sits so far within the Joss-house, that space is left in front for various devotional apparatus, among which is seen a censer containing gilt paper and pieces of scented wood, presented as offerings; a piece of the wood is slowly burning. Ascending to the deck, and then going up a flight of steps to the second gallery, we find between two small cabins a Joss-house for the use of the sailors, which is less ornamental than that below, but similarly provided with Joss-sticks and other votive offerings. The idol in this Joss-house is the deity of the sea, with her two attendants, each with a red scarf. Along the top of the stern are ranged a number of small flags, which add to the gaiety of the exhibition.

In this slight sketch we have omitted any notice of a variety of carvings placed in glass cases, or scattered about the deck and galleries; likewise a number of Chinese sailors and officers, who, in proper costume, are seen lounging about the ship, as if very much at a loss what to do in the crowd of lady and gentlemen visitors. The Chinese sailors, it appears, were difficult to manage during the voyage. 'At first,' says the account already quoted, 'they were very particular in the performance of their idolatrous customs, burning paper, beating gongs, &c. in honour of their gods; but after a while they became negligent. It ought more correctly to be said that they voluntarily abandoned them, on the representations of Captain Kellett. One of their most common, and, to them, most highly-prized superstitions, was a belief in the efficacy of tying red rags on the rudder, cable, mast, and principal parts of the vessel, which were considered safeguards against danger. On an occasion when they were apprehensive of being attacked by a Malay pros, they tied red rags to the guns, and felt perfectly secure. One of their most revered objects was the mariner's compass: before this they would place tea, sweetcake, and pork, in order to keep it true and faithful. They gradually became accustomed to the European compass, and laid by all their own but two, which were marked, at their request, with the thirty-two points in Chinese figures, and eight divisions. During the storms and hurricanes which the Keying encountered, they were at first exceedingly terrified, but were soon restored to comparative calm by observing the steadiness and confidence of the English part of the crew. As soon as a storm was over they burned Joss paper in great abundance. A very interesting personage on board is Hsing, a mandarin of the fifth class, whose distinctive mark is a crystal button on the top of his cap. He is forty-six years old, intelligent, amiable, and gentlemanly. During the voyage he has learned a little English; but the Chinese idiomatic turn which he gives to the language, as well as the difficulty he has in pronouncing it, conspire to render him not easily understood, though he is very anxious to make himself so. Captain Kellett has also taught him to write his name in English characters, of which accomplishment he is somewhat proud. Like most of the educated Chinese, he writes his own language very beautifully.'

We left the Chinese junk very much gratified with all we had seen; and as the vessel will in all likelihood

be brought round to Liverpool, the Clyde, and other ports, after satisfying metropolitan curiosity, it is probable that many of our provincial readers will have an opportunity of visiting this interesting specimen of Chinese ship-architecture.

THE AGE OF TOWNS.

Towns are certainly the most remarkable and interesting of human works. When the poet Cowper said, 'God made the country, but man made the town,' he unconsciously paid no small compliment to his own race, in as far as a large city is a wonderful thing for man to make. There the most prominent characteristics of human life are developed, and the progress of society in the knowledge of both good and evil is most distinctly obvious. There, too, the remark that the greater part of human productions long outlast their authors appears substantially true, as there are few of all the cities of Europe in which we cannot read in street, and church, and dwelling, as it were, the handwriting of generations whose very graves are forgotten.

Some of the inferior creation, such as rooks and beavers, have their towns also—chosen spots among old woods and streams—where they have built and burrowed from year to year, nobody knows how long; for their modes of life never vary: the successive inhabitants form their nests or dams exactly as their ancestors formed them when the mossy oaks were young, and their homes retain no history. It is not so with the cities of mankind; the thoughts and characters of different ages seem built up in them; and the contrast which many European towns present to each other in this respect has been often observed by tourists. Some, like the Old Town of Edinburgh, seem literally made of memorials of other times; and a stranger who walks their streets for the first time feels as if he were going back in the centuries. An enthusiastic Frenchman, in describing Abbotsford, called it a 'romance of stone and lime'; were the word altered to history, his description might suit those old-world cities. Others, like our New Town, have no story to tell of the past; but they speak mightily of modern improvement, popular progression, and advancement in what a German philosopher calls 'the art of living.'

The two great divisions of the Scottish capital thus furnish illustrations of the old and new aspect of things. Some British and many continental towns are similarly divided, and the traveller at once recognises the periods to which their different portions belong. But the age of cities, like that of individuals, cannot always be guessed from their appearance. Some are comparatively young, but have caught an old-established business-like air, from the combined effects of brick, coal-smoke, and commerce. Some look modern and busy to the new-comer, while their back streets are full of dim traditional houses, and quaint spires are seen beyond their fashionable streets and new-built squares. Some are old in name and situation, though new in form and materials: terrible visitations of war, or tempest, or fire, have swept them, in the emphatic language of Scripture, with the besom of destruction, time after time, but still the town has risen from its ruins.

Athens is an extraordinary instance of this class. It is, according to the most authentic history, the oldest city in Europe, having retained its present appellation for more than thirty centuries, through all the vicissitudes of empires and creeds that have passed over the world in the lapse of that long period; and in spite of fires, sieges, and plagues, whose very enumeration would occupy more space than this article, still presenting to the traveller's view the same outline of magnificent ruins crowning the rocky citadel known as the Acropolis, round whose base the city lies as it lay in the days of Plato.

Constantinople is the next oldest city of Eastern Europe. Its ancient name, as is well known, was Byzan-

tium, having been built by the Greeks; but when Constantine became a Christian, the Romans, who were then strongly inclined to Paganism, showed so much hostility to the emperor's religion, that he determined to transfer the capital of his empire to this city, on which, accordingly, his own name was conferred. Old authors inform us that a great concourse of inhabitants from all parts of his vast dominions were induced to settle there by a promise of freedom from taxes of every description for three years, whilst artificers thronged to it in crowds, owing to the liberal employment afforded by the erection of palaces and other public buildings; so that Constantinople was styled the 'Edifice of Rome.' Nor must we forget that the Turks, whose capital it has been since they captured it under the last of Constantine's successors, about the middle of the fifteenth century, have given it the name of Stamboul, signifying in their language the 'Queen of Cities.'

Rome is another example of durability, meriting almost in this respect the name bestowed upon her in her days of old Pagan pride—the 'Eternal City.' Founded upwards of seven hundred years before the Christian era, Rome is said to have been rebuilt three times over the ruins of successive cities, which in some parts are believed to lie more than sixty feet deep under the pavement of the present streets.

Most of the old cities of Italy belong to as early an age, and it is truly surprising for how many centuries men have continued to congregate on the same spots. Florence, the capital of Tuscany, famous as the birth-place of Dante, Michael Angelo, and many of the greatest in Italian art and literature, and still celebrated as one of the most beautiful cities of Europe, whose palaces and picture-galleries occupy half the journals of our tourists, has kept her place beside the Arno for more centuries than have been chronicled. Dante thus refers to her history: 'I was an inhabitant of Florence, that city which changed her first patron, Mars, for St John the Baptist; for which reason the vengeance of the deity thus slighted will never be appeased, and if some remains of his statue were not still visible on the bridge over the Arno, she would have been already levelled to the ground; and thus the citizens who raised her again from the ashes to which Attila had reduced her would have laboured in vain.' So firmly did popular superstition cling to Pagan relics in the middle ages: but it appears that the broken statue to which the Florentines attached so much importance was carried away by a flood that destroyed the bridge on which it stood, in the year 1337, without the ill effects which the citizens apprehended from the loss of their fancied Palladium.

Milan, now the capital of Lombardy, is also of old foundation. The precise date can scarcely be ascertained; but it was an emporium of cheese and corn before the Christian era. The city was twice razed to the ground—first by Attila, king of the barbarous Huns, who invaded the Roman Empire in the fifth century; and afterwards by Frederic Barbarossa, emperor of Germany, who vowed not to leave one stone of it on another, because the inhabitants—whom he had obliged to appear before him, by way of satisfaction for a previous rebellion, with ropes about their necks—had, after his departure, paraded his own image through their streets equipped in a similar fashion. Redbeard—such was the meaning of the emperor's surname—kept his word; and Milan has been taken, with more or less injury, by every conqueror from Charlemagne to Napoleon. During the ages of tilt and tournament, Milan was celebrated for the manufacture of armour, to the durability and beauty of which all the historians of those times testify; but when knightly fashions passed away before the invention of gunpowder and the advance of military science, the town returned to its earlier and more pacific commerce in cheese and corn, to which later centuries have added silk. Yet its cathedral, entirely built of snow-white marble, is still the admiration of all lovers of architecture; and its traffic in the commodities we have enumerated confers

an almost equal distinction on Milan in the eyes of the commercial world.

Naples, the city of Vesuvius, with whose bay and sky, lovely clime and lazy lazzaroni, so many views and descriptions have made the British public acquainted, is the successor of far older towns, which occupied almost the same site at the base of the great volcano, ages before its first-recorded eruption. There stood the beautiful Parthenope of the Greeks, believed to be as ancient as Athens itself. It was succeeded by the Neapolis, or new city of the Romans, from which the present city derived its name, and was the chosen residence of some, though not the best of their emperors. Since then, it has been overwhelmed by lava, rebuilt by princes, possessed by Goth, Saracen, Norman, Spaniard, and French by turns; but it is still the capital of the finest country in Europe, and the boast of its inhabitants, whose pride in it has dictated the proverbial saying, 'See Naples, and die!'

The two celebrated cities Venice and Genoa resemble each other in age and origin, as they did about the close of the middle ages in political position and commercial importance. Some inhabitants of the eastern coast of Italy, who sought refuge in the isles of the Adriatic from the horrors of the Gothic invasion at the beginning of the fifth century, were the founders of Venice; and some fishermen, who built their huts on a steep acclivity beside the western gulf at the same disastrous period, were the first inhabitants of Genoa. The power and splendour which both these cities attained, and their terrible contests for pre-eminence in Italy, occupy a prominent place in the history of the twelfth and thirteenth centuries. The commerce and colonies of Genoa penetrated as far as Krim Tartary; and besides being at one period the most powerful state in Europe—styled the bulwark of the Christian faith, on account of its successful war against the Turks—and the emporium of European commerce with the East, Venice is known to all the lovers of romance and poetry from Tasso down to Byron.

Padua ranks still higher in seniority. It was the birthplace of Livy, the Roman historian; and Virgil says it was founded over the grave of one of the companions of Æneas. It was devastated by Attila, taken by Charlemagne, and celebrated throughout the fourteenth and fifteenth centuries for the learning of its university and the beauty of its velvets; yet in our own days its ninety-six churches and twelve colleges are almost as well attended as they were in that distant period.

The oldest town in France is Marseilles, there being historical evidence of its being built by a Greek colony in the same century with Rome; since then, Gauls, Romans, Goths, and Franks, as the ancestors of the modern French were called, have inhabited it in turn. It was twice burned down, and once literally desolated by one of those terrible plagues to which Europe was formerly subject; but it is still a well-known port of the Mediterranean, as it was in the days of Augustus.

The foundation of Lyons is uncertain. Augustus made it the capital of Celtic Gaul. An imperial palace was subsequently erected in the city, whence the Emperor Nero, of unenviable notoriety, is traditionally said to have issued a characteristic decree, by which all the poets of the town—who were, it appears, sufficiently numerous—assembled on the 1st of June at the temple of Apollo, in order to read their compositions before him, when the author of the best was rewarded with a laurel crown, and he of the worst had his choice to obliterate all he had written with his tongue, or be thrown into the Rhone. Whether this tale be true or not, history records that the city was burned to the ground, palace and all, by an accidental fire in the reign of that gentle censor of the press. The Burgundians made it their capital in the fifth century, after which, in spite of many conquests and inundations, it continued to rise in mercantile importance. The sect of the Waldenses was founded by Peter Waldo, a mer-

chant of this city, in the twelfth century; and in the thirteenth it afforded refuge to all the Italians driven from their country by the wars of the Guelphs and Ghibelines. The still more sanguinary contentions of the Protestant and Catholic parties in the sixteenth century all but destroyed Lyons; and the frightful devastations of the first revolution, in which its name was changed to Ville Affranchie, are well known to all acquainted with the history of that extraordinary time; but Lyons is still the second city in France, retaining its old appellation, its wealth, and its silk manufacture.

Paris is of a much more modern date. It was a small but fortified town in the days of Julius Cæsar, when the Romans took it from the Gauls; the Emperor Julian the Apostate erected, some say a palace, and others a fortress, on a small isle in the Seine, where now stands the church of Notre-Dame, about the middle of the fourth century. The Franks took it in 496, and fixed there the capital of their kingdom; but history records that twelve francs was the whole sum of taxes collected monthly at the northern gate in the reign of Louis Le Gros; and the first paving of the streets took place in the year 1190. Though comparatively new, Paris has had its share of vicissitudes. The 'black death,' as a frightful disease was called which ravaged Europe about the middle of the fourteenth century, left it almost depopulated; and in a terrible famine of the following age, a hundred thousand, being two-thirds of its whole inhabitants, perished in three months. It suffered many a siege, including that of the gallant Henry IV., against whom it was held by the partisans of the League, till provisions began to fail, and the king's army hoped to take it by means of famine; but Henry said he would never see the capital of his kingdom starved for the sake of a crown, and therefore commanded a free passage to be allowed for provisions of all sorts, which noble conduct, says a historian of the period, 'won him the city of Paris and the praise of all nations.' From that time till the present, Paris has seen more riots and revolutions than any other European capital.

It is strange that so small a portion of history should be occupied by the metropolitan cities of Portugal and Spain. Both Madrid and Lisbon owe their origin to the ages of contest between the Moors and Christians for possession of the Peninsula. In the days of the Cid, the former was a Christian village, without wealth or commerce, being situated three hundred miles in every direction from the sea; and the latter was a strong fortress of the Moors, taken by Alphons, first king of Portugal, about the middle of the twelfth century, with the assistance of some English Crusaders and ships from the Hanse towns, or seven free cities of Germany, who sailed up the Tagus for that purpose: since which time Madrid has had many kings and fires; and the destruction of Lisbon by the great earthquake in 1755 is chronicled among the memorable events of Europe.

London, which alone surpasses Paris in wealth and population, is known to be much older. But setting aside the story of its being founded by the giant Lud, a contemporary of the celebrated though somewhat uncertain King Arthur, history assures us that it was a Roman station in the reign of the Emperor Claudius, subsequently a city of the Saxons, and finally raised to metropolitan importance by William the Norman, who granted the citizens the following specimen of a charter, written on a morsel of parchment six inches long and one broad:—'William the king friendly salutes William the Bishop, and Godfrey the Portreve, and all the burgesses within London, both French and English. And I declare that I grant you all law worthy, as you were in the days of King Edward. And I will that every child shall be his father's heir after his father's days, and I will not suffer any person to do you wrong; God keep you!'

It is a remarkable fact, that since the date of this

charter, London has never been actually taken, though often threatened by enemies, and frequently visited by fire and pestilence, which were particularly in darker times the great destroyers of cities.

The early history of Manchester is highly curious. Originally a Roman station, and called Mancunium, it became in the Saxon times a subject of contention between the English and the Northumbrian Danes. When William the Conqueror compiled the Domesday Book it appears to have had two churches. In the reign of Henry VIII. its charter was confirmed as a place of sanctuary; but the privilege was transferred to Chester in the following year, as it had been found to operate to the prejudice of the wealth, credit, and good order of the place. So late as the middle of the last century, an act was obtained to exonerate the town from the obligation of grinding corn at the free school mills; and no one dreamt of the immense cotton trade of which Manchester is now the emporium.

Birmingham took its name from one of the followers of William the Norman, on whom the greater part of Warwickshire was conferred, by way of reward for his services in the conquest of England. The baron was called Sir Hugh De Birmingham; and in the eleventh century he built a castle, round which grew a village, inhabited by his retainers on the sloping banks of the Rea, where now thunder the thousand mills and forges of Birmingham.

Bristol is mentioned among the fortified cities of Britain in the year 420. Its present name is said to have been derived from that bestowed upon it by the Saxons—Brightstowe, the Pleasant Place. In the latter part of the eleventh century, a market is said to have been held there for slaves, according to the feudal barbarism of the period. In the following age a monastery, whose magnificent remains still attract the attention of antiquaries, was erected on the same spot by King Stephen. A still more interesting fact connected with the history of modern improvement is, that the first barge passed from Bristol to Bath in 1727, the Avon being then for the first time rendered navigable.

York rivals London in age, as it did in the thirteenth and fourteenth centuries in almost everything. They were, in fact, rival capitals; York being much about the size of old London, and far better fortified, as Edward III. expresses it in one of his proclamations, for 'a bulwark to the land against the wasteful fury of the Scotch.' Parliaments were occasionally held here; and one remnant of ancient grandeur still retained, besides its massive towers and gates, not to mention the celebrated minster, is the title of lord conferred upon its mayor, who is the only civic chief in all England entitled to that distinction besides the mayor of London.

The two university towns Oxford and Cambridge are of uncertain age; they date at least from the Anglo-Saxon times. Cambridge appears to be the most ancient, there being tolerable grounds for believing it of Roman origin. Many towns in England have the syllables *chester* and *cester* as part of their names, and are understood from that circumstance to be, at the latest, of Roman origin, while some are known to have been British. The term *cester*, or *chester*, is obviously either from a castle (*castrum*) or a camp (*castra*), which had been placed upon the spot by the Romans.

Of all English towns that have risen to any importance, Liverpool is the most recent, with the exception perhaps of its new rival, Birkenhead. In the year 1710, Liverpool was but a fishing village; and the first impulse to its prosperity was said to have been given by the Guinea slave trade, at that period regarded as a lawful branch of commerce even by Englishmen. A story is current that Liston the celebrated comedian being hissed one night by a Liverpool audience, reminded them, by way of reprisal, that their city was built with the price of Guinea negroes.

Scotland having scarcely any distinct history before the eleventh century, we can date none of her cities

from an earlier period with any certainty. The twelfth century is the commencement of the era of her privileged towns, none of which at that time contained any buildings but such as could be rebuilt almost as quickly as they were destroyed by invaders. Perth and Aberdeen are among the oldest towns; yet the former, in the days of Bruce, is spoken of as only 'a poor hovel.' Edinburgh was of no importance till the latter part of the fourteenth century. Glasgow, though an ancient episcopal city, and in the seventeenth century a handsome-built small town, may be said to have sprung forward in commerce and population within the same time as Liverpool. It is eminently a city of the eighteenth and nineteenth centuries.

Prior to 1697, Greenock was but an unknown hamlet, where some herrings were occasionally caught; but in that year the directors of the Scottish Indian and African Company came to a resolution of erecting a town on the Firth of Clyde, and in the following year the inhabitants in vain petitioned parliament for a grant to build a harbour. Their failure in this project was supposed to have been owing to the hostility of the magistrates of Glasgow, who were jealous of the rising importance of the town; but the people of Greenock exhibited on this occasion an ingenuity and resolution which deserved to be successful. They entered into a contract with their superior, Sir John Shaw, under whom they held their properties in fee, and agreed to assess themselves in the sum of one shilling and fourpence on each sack of malt brewed into ale within the limits of the town. Parliament had refused to sanction this tax, but the inhabitants were unanimous, and as ale was then the universal beverage of the labouring classes in Scotland, a sufficient fund was raised to begin the harbour in the course of seven years. The whole expense was estimated at £3556, which so alarmed the commonalty, that they agreed to transfer the harbour, with the tax already mentioned, into the hands of their superior in his advancing the money, which any mercantile house in Greenock would now consider as an item in its liabilities.

The metropolis of Ireland is said to have been founded by the piratical Danes in the beginning of the ninth century, and from them it derived its present name, Dublin, which in old Danish signifies the black pool; but why this appellation was given, tradition assigns no reason. Certain it is that Dublin continued the stronghold of the northern invaders, and the repository of their plunder from all the surrounding country, till the English conquest under Henry II., who made it the capital of his Irish dominions, and received the homage of his new subjects in a large pavilion, 'well made,' says a chronicler of the times, 'with smooth wattles'; nor was this regal residence much out of character with the rest of the city. Historians inform us that so late as the reign of Elizabeth the houses of Dublin were entirely constructed of wattles and clay; about this period brick began to be used; but the great increase of Dublin took place in the eighteenth century, and it is curious that no specimen of domestic architecture of an older date now exists within the liberties.

Cork owes its origin, in the middle of the seventh century, to a kind of monastic school, which a friar, called by his countrymen St Finbar, established on the site of the present city, then a solitary marak: round this seminary the town gradually grew; and after the invasion, an English colony held it for one hundred years against the neighbouring chiefs; but they drank, says the 'Annals of the Four Masters,' in continual fear, shutting the gates at service and meal-times, and always from sun to sun, neither did they admit any stranger who carried a weapon.

Towards the north of Europe, the towns, like the civilisation, belong to later times than those of the south. The cities of the Netherlands in general took their rise from the revival of commerce in Europe at the close of the middle ages; Ghent, Bruges, Antwerp, and Amsterdam, were famous in the fourteenth

thirteenth, and sixteenth centuries for the commercial wealth, which flowed into each of them in turn.

Cologne is believed to be the oldest city of Germany, being built by the Roman Empress Agrippina, and considered ancient even in the thirteenth century, when its great cathedral was commenced, which was only half finished at the time of the Reformation, and still remains so.

Berlin, the present capital of Prussia, originated in rude huts, built in the marshes of the Spree by the Vandals, who sought refuge there from the conquering arms of a German prince, known in history as Albert the Bear; but having at length conquered that district also, he erected a fortress there in the middle of the fifteenth century, which in process of time became a town, and took the present appellation; it is not certain whether from the founder's name or the savage character of the country, which is now one of the best cultivated and most civilised in Europe.

The city of Leipzig is celebrated for two of the greatest battles of modern history; one in the war of the Reformation, at which Gustavus king of Sweden fell, and the other in 1813, in which the army of Napoleon was utterly defeated, and still more so for its great book fair, frequented by all the trade of Europe; yet at the close of the tenth century its site was occupied by a small Sclavonian village, situated at the confluence of the Elbe with the Pleisse; and the first mention of Leipzig as a fortified city is in the twelfth century, in the time of Otto the Rich, who established the two fairs of Easter and Michaelmas. The origin of Hamburg was a church and a fort which Charlemagne built to protect the frontier of his empire in that direction from the Pagan Saxons.

Vienna, the Austrian capital, was once a Roman camp on the Danube, afterwards a stronghold of the Huns, from whom Charlemagne took it in the beginning of the ninth century; and it has experienced many a master and siege since, including that of the Turks at the close of the seventeenth century, from whom it was rescued by the celebrated John Sobieski, king of Poland.

The towns of the Baltic, including Stockholm and Copenhagen, were in the tenth century fortresses raised by the plundering Northmen, to which their ships brought home the spoils of southern and western Europe. Warsaw, now the capital of Poland, and so tragically involved in the history of that unfortunate country, was founded so late as the twelfth century by the Teutonic knights, a military order of then Catholic Germany, whose occupation was to defend the frontiers of Christendom from the northern Pagans; and by way of encouragement, the Pope conferred upon them a grant of all the lands they could conquer north of the Elbe, which was, at the period of their establishment, considered the boundary of civilisation.

Petersburg, the metropolis of the Russian empire, is well known to be the most modern capital in Europe, having been built almost as it now stands by Peter the Great in the early part of the last century: its old rival, Moscow, was founded by the Grand Duke Jurge I. in 1147. Perhaps no city in the world has experienced greater vicissitudes than this ancient capital. It was twice burned to the ground by the Tartars, and once utterly destroyed by the Poles, who in the beginning of the seventeenth century conquered that part of Russia, which, compared with recent events, may well illustrate how nations take their turn of power and prosperity. We have thus glanced at the ages assigned to the different towns of Europe by the general current of history; but it must be admitted that much uncertainty and many conflicting accounts exist on this subject, as the inhabitants of almost every town appear inclined to treat the age of their city exactly the reverse of their own, and tradition usually draws long bills on antiquity; but setting aside these doubtful authorities, it is evident that some cities have existed as long as two, and even three thousand years. What millions of

human beings must have lived and died within their bounds in the course of these changeable centuries! It has been calculated that the whole inhabitants of Athens, throughout its different generations, would treble outnumber all the nations of Europe put together; and even in the most recent of our great towns, how many successive generations have already grown up, and laboured, and passed away; so that to the newest, as well as the oldest among them, the philosopher's remark is equally applicable, 'The history of this city, truly written, would be the story of the world!'

ST ANDREW'S SOCIETY OF ADELAIDE.

IN Nova Scotia, Canada, and perhaps every other colony, there is a St Andrew's Society—an association of Scotchmen, united to maintain friendly intercourse with each other; to assist poor wanderers from their native country, and to enjoy a festival one day in the year, the well-known 30th of November, or St Andrew's Day. We sometimes receive colonial newspapers giving an account of these annual meetings; and it is amusing in this, the home country, to observe the enthusiasm with which each speaker recalls—after dinner of course—remembrances of the hills, the dales, the rivers of old Scotland; the end of every three sentences being marked with *tremendous cheers*, and every speech followed first by *all the honours*, and then by a song or tune, such as 'John Anderson my Jo,' the 'Flowers o' the Forest,' or the 'East Neuk o' Fife.'

A South Australian paper lately reached us containing an account of one of these national reunions, which took place last St Andrew's Day in Adelaide, at which about fifty Scottish and a few English gentlemen were present—'Mr Edward Stirling, J.P., in the chair.' We specially notice this meeting in consequence of the oratory having been somewhat less convivial and more business-like than is usual on such occasions; because more than one of the speakers made some observations on the subject of immigration; and also for another reason, which will immediately be noticed. The 'speech of the evening' seems to have been that of Dr Wark. After touching on the affections, and the number of individuals who had left the blue hills of Scotland for the bright sky and extensive plains of South Australia, he came to the great question—'Have our hopes been realised or disappointed in coming to this land? For his own part, he would say that all reasonable hopes had been more than realised. The bad odour which South Australia had got into at home arose from various causes. Many scapegoats were sent out, a disgrace to their friends at home, and nuisances here. These soon got rid of their money, and like the Prodigal Son, either contrived to go home, or write home dolorous and false accounts of the colony, which were readily believed, and earnestly circulated by dear mamma and fond papa. Instead of saddling their poverty on themselves, they maliciously saddled it on the land, on which they had wantonly spent their means. Others came here with the view of rapidly making fortunes, and returning quickly to spend their days in their native land. The high price of stock, labour, and food, at the onset, with sudden depression in value of every species of produce, blasted their hopes, and soured them at the colony, which they either left, or wrote of with disgust. The bad accounts from the many swallowed up, like the lean kine, the good from the few; and at length our celebrated countrymen, the Chambersees, through their extensively-circulated Journal, sealed the fate of emigration to this land among the labouring masses. The minds of the best people are sometimes abused; and it is to be hoped that the same honourable journalists will live to make some amends for the injury they have unwittingly done them.'

Here we take leave to interrupt the doctor. Thanking him for his compliment, we protest against the assumption that we ever said a word in disparagement

of South Australia unwarranted by the general information which a few years ago reached Great Britain respecting the colony, or by the actual results which followed. What we chiefly maintained was, that no colony could expect to thrive which did not betake itself to earnest industry; and that vast numbers in South Australia, having to all appearance relinquished an industrial career, in order to gamble in 'town lots,' ruin must inevitably follow. And did not the most ruinous consequences ensue, not only as respects the gamblers themselves, but the agricultural and pastoral interests? We are glad to think that bitter experience has cured this mad spirit of gambling, and that each man, instead of trying to pick the pocket of his neighbour, has betaken himself to his own proper line of industry. Changed in social character, with enterprising settlers spreading over its surface; blessed with one of the finest climates in the world; and suitable alike for the husbandman and store farmer—South Australia, as was lately noticed in the present Journal, offers a favourable field for a judiciously-conducted system of immigration. With this explanation, required to set us right with our South Australian friends, we may allow the doctor to proceed:—

'Since the settlement of this colony, the land had yielded her increase bountifully, while her flocks and herds had prospered beyond the most sanguine expectations. The fruits of the temperate climates, and many of tropical, are matured here to perfection. The land is capable of producing in abundance the necessaries, and even the luxuries of life. Some ten years ago this colony was a wilderness. Look now at the city of Adelaide—let us travel the length and breadth of the land, and witness stations on every available spot—and then we may see a literal fulfilment of the saying of the sacred poet—"The wilderness and solitary places shall be glad; the desert shall rejoice and bloom like a rose." As regards the climate, it is adjudged to be delightful, notwithstanding the occasional extremes of heat; and to speak professionally, he could bear testimony to its healthiness. In the hot season, disease was certainly severe among children in town; but go to the bush, and look at the little urchins waddling with bullock whips in their hands before they can lisp, and driving the plough before they are fit to be taught to read. In fine, this climate was delightful and salubrious, the soil abundantly productive; and to crown all, were not the bowels of the earth teeming with the richest and most useful mineral ores, and stones time immemorial termed precious? This colony was established to be, politically speaking, a self-supporting colony; but in the wide range of her Majesty's dominions, was there a known spot more capable of eventually being literally so? Abounding in the staple articles of food and raw materials of clothing, with an inexhaustible supply of useful and valuable minerals both for manufacturers and circulating medium, the time was likely to come when the supply we now draw from home and other countries might be manufactured within our own limits. Strong inducements had been held out to induce the labouring classes to come to the colony; and had they been disappointed? Most assuredly not. Whoever had not succeeded must blame himself, or must have met with extraordinary calamities. All who were willing and able to work found employment, at a rate of remuneration by which they could raise themselves in their circumstances. Many who came penniless to the colony were now extensive proprietors: they now possessed property, and enjoyed a plentiful table, while their labouring companions they had left behind had wasted their bodies for a scanty subsistence, and were now beginning to see old age coming prematurely upon them.'

Dr Cumming was the next speaker, and he is equally pointed in his observations. 'It is the object of our society,' says he, 'to open up an intercourse with Scotland—the land of our fathers; and by giving information that can be relied on, unfold the capabilities of this

great country. We all know that very many industrious farmers, mechanics, and labourers, can improve their circumstances vastly by emigration; and the smiling land of our adoption holds out her ample arms to welcome them. Though Scotland were to-day entirely freed from her entails, yet to the labouring man it would give little hope of rising above that of a labourer, or at most a poor tenant. Last century, delvers and ditchers were poorly paid, and it is no better now that the population has doubled. Here a few years of what at home would be considered moderate summer labour, affords the means of purchasing and stocking a freehold farm; and thus affording what to every well-principled man is the height of his ambition—provision for his family, and sitting under his vine and fig-tree, none offering or daring to make him afraid.'

Mr Frew, another speaker, says, 'We know of the distress at home; and if we could induce the starving peasantry to cast their lot among us, we should be helping them as well as ourselves. Let them come here—they would be heartily welcome.'

Alluding to the pastoral character of the colony, Mr Cumming speaks of the great impetus imparted by the introduction of Australian wool into the woollen manufactures of Scotland. Formerly, the Scotch manufacturers contented themselves with working only British wools, and so long as they did so, they carried on but a poor trade. A new state of things ensued on the introduction of the fine wool of Australia into the manufacture of tartans and tweeds. 'For years this new and peculiar trade,' says Mr Cumming, 'has been flourishing; and Scotland now stands at the very head of this branch of industry, and has produced a quality of goods fitting for, and yielding comfort to, royalty. It must delight them all to know that Hawick, Jedburgh, Galashiels, Menstrie, Alva, Tillicoultry, Stirling, and Bannockburn are flourishing from this cause. He could not forget that Perth, Crief, Auchterarder, and Auchtermuchty, boast of their Galas.' The pastoral interest, through whose agency the wool was produced, 'was a great one. He believed that in the Australian colonies there were about 6,000,000 sheep, besides cattle. In this province there were about 1,000,000, and yielding a steady increase. As fine wool was produced as was anywhere to be met with; and though sometimes a little carelessness had been complained of, yet there was every prospect of future praise as well as profit. The pastoral life had ever been the emblem of happiness, and honourable to all, from Abel downwards, and in this country it appeared to be a truly pleasant one.'

Next follows a speech on the mining interest. The discovery of mineral wealth has given a prodigiously increased value to the colony; 'but,' says the speaker, 'we are crippled for want of labourers.'

We may here drop the curtain on the scene. The thing that strikes us throughout the proceedings is the iteration of the cry—"want of labourers." Give us plenty hands to help us to till the lands, to tend the sheep, to dig in the mines, to drive our cars, and otherwise assist us, and we will show you what we can do, not only for the colony and ourselves, but for the labourers themselves! Let us hope, as we said on a late occasion, that this cry for labour proceeds on no unsound consideration of what is due to labourers when they arrive; and that it will not be followed by a reaction like that which already occurred when bands of emigrant labourers, instead of being employed at fair wages, required to be supported for a time as paupers. We desire, in short, to see a properly-conducted system of emigration, not a heedless outpouring of human beings, likely to cause a glut in the market of labour. It would very greatly tend to promote confidence in demands for labourers or anything else, if the colonists—we speak not of South Australia alone—would on all occasions apply direct to the people at home, and not leave their wants to the chance of being imperfectly heard of through the colonial papers, which few in

Great Britain see, or what is equally useless, through the enginery of the colonial office. The St Andrew's Society of Adelaide, for example, is stated by one of the speakers at the above meeting to have for its object to 'open up an intercourse with Scotland, and by giving information that can be relied on, unfold the capabilities of this great country.' This is a useful and praiseworthy object; but why is it not carried into execution by the immediate dissemination throughout Scotland of such information as the society can vouch for—names of members being appended? As far as we have heard, nothing of the sort has been done; the society to all appearance contenting itself with a notice in a colonial newspaper, which not a dozen people in Scotland will ever see, and which has come into our hands only through the kindness of a friend. We repeat a hint which cannot be too frequently offered to the colonists—'You will never get what you want from the mother country till you appeal by direct address to the people!' Any communication of this kind will be gladly received from the St Andrew's Society of Adelaide, and we hope that such will be current amongst us before the next 30th of November.

THE LONDON BAKERS.

A MOVEMENT, as may be known, has lately been made towards meliorating the condition of the London operative bakers, which, from the following evidence of Dr Guy, laid before parliament, must be acknowledged to be bad enough.

'The journeymen bakers of London are almost without exception overworked. From 18 to 20 hours of continuous occupation, with perhaps a nap of from an hour to two hours on a board, may be stated as the rule with the large majority of the trade. It often happens towards the end of the week that the poor fellows are employed without rest or sleep for more than 48 hours on a stretch. The wages which the men receive varies from 10s. to L.1, 10s. a-week. The average will be about 16s. or 17s. A foreman will get from L.1 to L.1, 10s.; a second hand 16s. to L.1, 1s.; and a third hand from 10s. to 14s., in addition to an allowance of bread and flour. Considering the rate of wages in other trades, and the amount of work required of them, they are very badly paid. One reason of the low wages of journeymen bakers is undue competition. A man can set up as a master baker with very moderate capital; hence this trade is naturally overstocked, and profits are reduced so low, that many of the masters can only live by overworking and underpaying their men. Another circumstance which tends to reduce wages, and which is at least as effective as competition itself, is the bad state of health of the journeymen bakers, brought on by the very overwork of which I have been speaking. In all sickly trades there must always be a great number of men thrown out of work by illness; young healthy recruits are constantly coming up from the country to supply their place; and thus the labour-market is overstocked, and that, too, with men impoverished by illness, and too glad to be taken into employment on almost any terms. I do not attribute their liability to disease entirely to overwork. They are exposed to heat, which, while it exhausts them, renders them liable to colds, and seems to favour determination of blood to the head; to dust from the flour, which irritates the lungs; and to severe exertion, which leads to palpitation, diseases of the heart, and apoplectic seizures. There is also in the habits of the journeymen bakers something which tends still further to impair their health. They do not employ the only holiday they have in the week—the Saturday evening—in a manner likely to recruit their strength, preserve their health, or improve their morals. They meet at public-houses—not merely for the purpose of recreation, but when out of work, they use them as places of call. The bakers, I believe, have the character of being a dissipated body of men; but exposure to heat, overwork,

and one evening in the week only for recreation, are circumstances favourable neither to mind nor body. They have not even the Sunday to themselves; for in the morning, and at noon of Sunday, they have to attend to the baking of dinners. They might go to church in the afternoon; but it is the natural tendency of the overwork to which they are subject to indispense them to frequent the church. The bakers, as a class, are short-lived. There are few old or even middle-aged men among them. The oldest man I saw was 65, but I believe there are a few older men at work. The average of the whole 111 was only 30½ years. I look upon this low average age of the journeymen bakers as a proof of the unhealthiness of their occupation. It is only to be accounted for by premature death, and the constant influx of young men to supply the place of the deceased. I found none in what may be termed robust health; that is to say, with healthy florid complexions. The diseases to which the bakers are most subject are rheumatic fever, erysipelas, inflammation of the lungs, and consumption; but especially the last two are their most severe and fatal maladies. The less severe diseases of which they complain are colds, rheumatism, indigestion, bowel complaints, skin diseases, and bleeding at the nose. Ruptures are common among them. I should think that there is no class of men, excepting perhaps the grinders of Sheffield, so liable to severe diseases of the chest as the bakers.

'Of 111 whom I examined, 19 had had some severe and lingering disease of the lungs, and 89 complained of being subject to less severe disorders of the chest. If the two numbers be added together, no less than 108 habitual or severe diseases of the lungs will have to be divided among 111 men. I attribute in part the dissipated habits with which the bakers are charged to their being overworked. People who have but one evening to themselves in the week, who have no time to cultivate their minds, and who are always in a state of bodily exhaustion, must be in great danger of finding the public-house too attractive. The bakers are exerting themselves for the abolition of night-work; and from what I can understand, there would be no difficulty in doing away with it altogether, except the opposition of a minority of under-priced bakers, whose profits arise from exacting an excess of labour from the men; that is to say, the majority of the trade are the slaves of the minority. The great majority of the bakers are from Scotland, a large number from Devonshire, and several from the other western counties: a few from Ireland. Scotland is the great nursery of bakers. The master bakers in Scotland and the western counties of England are in the habit of employing only apprentices, who are dismissed as soon as they are out of their time, and are thrown on the English labour-market. Most of them, I believe, come to London; and this adds to the competition by which the wages of labour are beaten down.'

Dr Guy further mentions that the great majority of masters and men look alone for a remedy to the interference of the legislature. It would seem almost unnecessary to say that any expectations of this kind must prove fallacious. Further than the general enforcement of certain sanitary regulations, nothing can be advantageously done by the legislature, unless it be the abolition of the window duties. But strangely enough, the very legislators who are seen lamenting over the darkened condition of the workshops in which the poor operative bakers of London are doomed to toil, divided, if we mistake not, against the repeal of the duties levied on windows. As regards the general question, it is extremely difficult to see how, according to existing tastes, and in present circumstances, the condition of operative London bakers is to be improved. A loud and very just complaint is made against night-work; but all know that this is caused by the public demand for hot rolls at breakfast, and there can be no possible remedy till the use of that species of bread is abandoned: then comes the excessive competition among employers,

which renders the smallest saving necessary: and lastly, the great overabundance of labour in proportion to the demand. Although one of the most slavish and deadly professions, young men crowd into it without the slightest regard for consequences. The vast redundancy in the labour-market is, in short, the main cause of the sufferings endured by the bakers; and we fear that this evil, to such an extent as may seem desirable, is not likely soon to be remedied.

A HEALTHY SKIN.

The scarf-skin is being constantly cast off in the form of minute powdery scales; but these, instead of falling away from the skin, are retained against the surface by the contact of clothing. Moreover, they become mingled with the unctuous and saline products of the skin, and the whole together concrete into a thin crust, which, by its adhesiveness, attracts particles of dust of all kinds—soot and dust from the atmosphere, and particles of foreign matter from our dress: so that in the course of a day the whole body, the covered parts least, and the uncovered most, becomes covered by a pellicle of impurities of every description. If this pellicle be allowed to remain, to become thick, and establish itself upon the skin, effects which I shall now proceed to detail will follow. In the first place, the pores will be obstructed, and, in consequence, transpiration impeded, and the influence of the skin, as a respiratory organ, entirely prevented. In the second place, the skin will be irritated both mechanically and chemically; it will be kept damp and cold, from the attraction and detention of moisture by the saline particles, and possibly the matters once removed from the system may be again conveyed into it by absorption. And thirdly, foreign matters in solution, such as poisonous gases, miasmata, and infectious vapours, will find upon the skin a medium favourable for their suspension and subsequent transmission into the body. These are the primary consequences of the neglected ablation of the skin. Let us now inquire what are the secondary or constitutional effects. If the pores be obstructed, and the transpiration checked, the constituents of the transpired fluids will necessarily be thrown upon the system; and as they are injurious, even poisonous, if retained, they must be removed by other organs than the skin. Those organs are the lungs, the liver, the kidneys, and the bowels. But it will be apparent to every one that if these organs equally, or one more than another, which is generally the case, be called upon to perform their own office *plus* that of another, the equilibrium of health must be disturbed, and the oppressed organ must suffer from exhaustion and fatigue, and must become the prey of disease. Thus obviously and plainly habits of uncleanness become the cause of consumption and other serious diseases of the vital organs. Again, if the pores be obstructed, respiration through the skin will be at an end, and as a consequence, the blood, deprived of one source of its oxygen, one outlet for its carbon, the chemical changes of nutrition will be insufficient, and the animal temperature lowered. As a consequence of the second position, cutaneous eruption and diseases will be engendered, and the effects of cold manifested on the system, and the re-absorption of matters once separated from the body will be the exciting cause of other injurious disorders. The third position offers results even more serious than those which precede. If a pellicle of foreign substance be permitted to form on the skin, this will inevitably become the seat of a detention of miasmata and infectious vapours. They will rest here previously to being absorbed, and their absorption will engender the diseases of which they are the peculiar ferment.—*Wilson's Treatise.*

A PLEA FOR HEDGE AND OTHER BIRDS.

Farmers and gardeners are sad enemies to hedge-birds. Making up their minds that they are enemies, and only such, they destroy them with an unsparring hand. They put a premium on their heads—their eggs—their young—their nests. They add cupidity to the destructiveness of youthful predators, and goad them on to destroy, far and wide, every bird which builds a nest, as if it were amongst the thorns and thistles wherewith the Almighty had cursed our race. The ignorance of this is as great as its cruelty. Very often they hire the destruction of their best friends, and then grumble that their crops are gone

by the aphid and the caterpillar. They grudge the bird the food which harbours the parent; and therefore it escapes, and breeds ten millions of consumers. We remember some sapient entry in an antique parish book, when the constable 'payd for vi. tomitts heads,' and cannot but pity the poor wretches, who have evidently more money than wit.—*Farmers' Journal.*

SONNET.

BY CALDER CAMPBELL.

Ye who the lack of gold would plead as lack
Of power to help another, think not so;
But where the stumbling steps of sickness go,
Follow with friendly foot; and in the track
Of life, when ye encounter, 'midst the snow,
Bewildered wanderers, turn not proudly back,
But lead them, gently from their walks of woe
By such kind words as cast a brighter glow
Than gold around them. Oh be sure of this—
The aims most precious man can give to men
Are kind and truthful words; nor come amiss
Warm sympathising tears to eyes that scan
The world aright! The only error is,
Neglect to do the little good we can!

SONNET TO THE BUTTERCUP.

BY THE AUTHOR OF 'A TRADESMAN'S LAYS.'

Will no one sing of thee, thou pleasing flower,
With livelier tint than daisy e'er put on?
Who, when warm Phoebus gives to May her down,
Smiling art seen the grass-green meads among;
What time the cuckoo tunes his mellow flute,
And on the sward the grasshopper we hear,
'Tis then all gaily in thy yellow suit
A smiling floral star thou dost appear.
Memory wipes off the dust of time, and brings
Sweet recollections of those joyous hours,
When wandering gladly near Dove's pleasant springs,
I culled a copious harvest of thy flowers;
With pinafore filled out—a venturesome boy
I tumbled in the grass, and shouted wild for joy.

THE MIND.

Of all the noble works of God, that of the human mind has ever been considered the grandest. It is, however, like all else created, capable of cultivation; and just in that degree as the mind is improved and rendered pure, is man fitted for rational enjoyment and pure happiness. That person who spends a whole existence without a realisation of the great ends for which he was designed; without feeling a soaring of the soul above mere mercenary motives and desires; not knowing that he is a portion, as it were, of one vast machine, in which each piece has a part to perform, having no heart beating in common with those of his fellow-men, no feelings in which self is not the beginning and the end, may well be said not to live. His mind is shut in by a moral darkness, and he merely exists, a blank in the world, and goes to the tomb with scarcely a regret. Such beings we have seen and wondered at—wondered that a mortal, endowed with so many noble qualities, and capable of the highest attainment of intellectuality, should slumber on through a world like ours, in which is everything beautiful and sublime, to call forth his energies and excite his admiration—a world which affords subjects for exercising every lively attribute with which we are gifted, and opens a scene of the richest variety to the eye, the mind, and the heart, and of such a diversified character, that we may never grow weary. If, then, you would wish to live, in the true sense of the term, cultivate the mind, give vent to pure affections and noble feelings, and pen not every thought and desire in self. Live more for the good of your fellow-men, and in seeking their happiness you will promote your own.—*Zion's Herald.*

STRUGGLES FOR LIFE IN THE METROPOLIS.

IN a metropolis swarming with nearly two millions of inhabitants, and with its society organised on the highest artificial system, the struggle for existence is often most intense, and productive of expedients to earn the means of subsistence which would never be thought of elsewhere. At all times there may be said to be a large floating population with no regular employment, and whose wits are ever at work to earn a penny. Besides all other causes of impoverishment, many tradesmen are thrown out of employment by new inventions and discoveries; and many more are next to destitute from an error in the choice of a profession, and their inability to attain proficiency in their craft. These last, after numberless attempts and defeats, and many and bitter mortifications, give up the matter in despair, and go to swell the ranks of the unemployable and supernumerary class. What becomes of all these, and how their wants are supplied, is a mystery not easily fathomable. 'Ten men,' says a German proverb, 'cannot tell you how the eleventh lives.' The following brief sketches may contribute in some degree to clear up a portion of the mystery.

The Duck-weed Hawker.—Walking one day by the river side, in the neighbourhood of Battersea, sketch-book in hand, and meditating a design upon the Red House, I was attracted by a picturesque-looking figure, busily engaged in raking the surface of a stagnant pool. By his side, on the bank, stood an old wine-hammer, reeking with muddy ooze. Feeling curious to ascertain what was going forward, I approached the operator, and civilly questioned him as to his proceeding. The following dialogue may give the reader an idea of a branch of industry which I confess was unknown to me till then.

'My good fellow, if I may be so bold, what is it you are doing?'

'Oh, bless your honour! no harm. I only wants the duck-weed you see, sir; and they never sets no wally on it, so I gits it for nuffin.'

'But of what use is that green scum, or duck-weed, as you call it?'

'Did yer honour never keep no ducks?' (I was compelled to confess my inexperience.) 'Vy, then, I'll tell yer honour. Yer see this ere as grows on the top of the vater is duck-weed, and in course the ducks is fond on it; and them as keeps ducks is glad to git it, in course, at a low figure. So ye see, as I gits it for nuffin but my trouble, I can afford to sell it cheap.'

'You don't pretend to say that people buy it?'

'Don't I though? Ketch me givin on it away! I gits a penny a measure for every morsel on it; and voths the money, and no mistake.'

'And where do you find customers?'

'Vy, that's the vurst on it too. 'Taint much of a nosegay to carry about a feller; still I don't travel no great ways—hadn't need, you s'pose. Vell, then, sir, as you don't calkilate no hopposition, an' p'raps you'll stan' the price of a half-pint, I don't mind tellin' ye. My walk is Tuttle Street, the Hambury, and Stratton-ground, and Brewers Green, and Palmer's Willage, and York Street, vere there's lots o' courts and alleys, and ducks in course.'

'Keep ducks there! Why, those are the filthiest neighbourhoods in Westminster.'

'That's the werry reason, sir: there is so much mud, they wants the ducks to gobble it up. He—he!'

'But where do they find room for them? There are neither yards nor ponds.'

'Oh, there's the street door front by day, and they doos werry vell under the bed o' nights. But I'm werry dry a' talkin', yer honour; and I mussn't waste no time, for yer see this ere sort o' green stuff vont keep not nohow, and must all be sold to-night.'

'Dry! why, you are dripping wet from head to foot.'

'Nothin' but vater, sir; and vater never vets Jakes, cos, d'ye see, I perfers beer.'

'Is your name Jakes?'

'No, sir, my name's Villums—Ned Villums. But they calls me Jakes cos I scums the mud-pools and ditches. But them as calls names pays their pennies; so I takes their tin and their compliments together, and never minds. Yer honour's a goin' to stan' summat, I know?'

Having complied with the poor fellow's demand, and helped him, as I best could, to shoulder his nauseous burden, I saw him trudge off beneath it, at a good five-mile-an-hour pace, to the sale of his moist merchandise. As he vanished with his dripping load, I could not help mentally comparing the present contents of the wine-basket to those of a past day—the sparkling juice of the grape to the reeking weed—and the different destinies of those who revelled round the bottles, and his who catered for the ducks. But the fellow was not to be pitied, and I felt that compassion would have been in his case injustice. He had health, humour, and spirits, which a wine-bibbing dyspeptic might have envied; and if his philosophy was not as elevated as that of Wordsworth's 'leech-gatherer on the lonely moor,' it was, to say the least of it, as practical.

Green food for Singing-Birds.—This is another article of perambulating merchandise peculiar to the great city, and one which meets with a regular and ready market during the greater part of the year. Chick-weed, groundsel, seed-grasses, and round green turfs, form the staple of the merchant's wares, with which he threads the streets and suburbs during the middle portion of the day; his cry being seldom heard before ten or eleven in the morning, and ceasing ere sundown,

when his customers and consumers go to roost. One of these verdant professionals passes my window thrice a week during the summer months, and I have frequently encountered him in occasional strolls for the last ten years. Tall and erect, brawny and broad-shouldered, and bronzed with the suns of sixty summers, he looks more like a trooper of the Guards than a retailer of chickweed. But he evidently delights in his way of life, which leads him to the green fields ere the lark is yet aloft; and as he plods his dilatory way along the public thoroughfares, he sings his loud and sonorous song to a self-taught tune. 'Groundsel and chickweed for the pretty little singing-bird,' is the song; and the tune, commencing by a chant of four words on C, the first note, runs down the scale, like the simple chime of village bells, to the octave below, upon which he dwells with a force and gusto that is quite catching, ere he resumes his everlasting *Da Capo*.

One day, while choosing a turf from his basket, to gratify an impudent pet bird, I questioned my tall salesman as to his inducement for following such a mode of life. 'Well, sir,' said he, 'I don't mind telling you, as you are a regular customer. The fact is, I couldn't do nothing else at the time I begun it, and wasn't fit neither for regular work. You must know, sir, I was bred a farm-labourer, and might have done well enough, for I was always fond of field-work, and cattle-tending, and such-like. But then, d'ye see, in eighteen-seven I listed—all along of a purty girl as didn't know her own mind—and main sad and sorry we both of us were when we found I couldn't be got off from serving. But that's neither here nor there. We parted, and in less than four years I went to Spain, where I had enough of sodgering. I've a stood, sir, up to my breast in growing corn, and seen the ears on't cut off wi' bullets as clean as a whistle. But that's no matter. I got a bad wound at Vittoria, which was the hardest day's work I ever see in my life. So I were sent home wi' a hartificial brain-pan, and eightpence a-day. I couldn't very well live upon that, you know, sir; so I comes up from Chatham (you know, sir, we're all sent to Chatham, up to Pitt's there, when we come from foreign parts), up to town here, to look about me. Well, sir, I couldn't get nothing as suited me, nor as didn't suit me either, for the matter o' that; and then my head did swim badly at times, though that's all right now, thank God! So, sir, I was a-standing one morning in one of them little streets by St Paul's when a gentleman comes out of a countin'-house wi' green shutters, and a pen in his ear, and he says to me, "My good fellow," says he, "haven't you got nothing to do? I want a man," says he, "as got nothing to do." "No, sir," says I, "I han't; and I should be very much obleeged to you for a job." "Then," says he, "do you see that lark in the cage, and do you know what he wants?" "I see him plain enough, sir," says I; "and it strikes me he wants to get out." "No, he don't," says he; "he's not such a fool. He wants a fresh turf; and if you'll go and cut him one, I'll give you sixpence." "That's a bargain," said I, and away I went; but I found it a long way to the green grass, and that sixpence was arned harder than some. But I cut half-a-score turfs while I was about it, thinking there might be more birds than one with a country taste. Well, the gentleman gave me a shilling when he knewed how far I had been, and I sold all the tothers for a penny a-piece. Arter that I took up with the weeds and grasses, and got a regular walk (one of my customers, as thinks his self very witty, calls it *Birdcage Walk*); and many's the bird in this

here town as knows my song as well as his own. That was my beginnin', sir, and I've kep the game alive ever since; 'cept in winter-time, when I sells snow and ice to the 'fectioners, and brandy-balls, and sich-like, to warm the stomach on skating-days. And let me tell you, sir, I likes feeding the little birds, and being my own master, better than shooting and sticking my fellow-creeturs at another man's bidding; and between you and me and the post it pays better.'

With this the quondam grenadier departed, and in less than a minute I heard the well-known cry, 'Grouse-sel and chickweed for the pretty little singing-bird!'

The Mushroom-Hunter.—Pursuing an avocation which renders me occasionally liable to be abroad at all hours of the night, the opportunity is forced upon me of observing the various phases of London life which each succeeding hour reveals. Following the example of the Vicar of Wakefield, I never refuse the challenge of any man, whatever his apparent station, who proffers his conversation; and I have often found the gossip of a wayfarer both interesting and profitable, while I am not aware that I ever lost anything by giving them a hearing. Business-belated one September night, or rather morning, for midnight had long ceased tolling from the thousand churches of the city, I was seeking for a short cut homewards, and stood for a moment hesitating at a hitherto unexplored turning out of Gray's Inn Lane, when I was accosted by a man of strangely uncouth appearance, who inquired if I had lost my way. Upon stating that I merely wanted the shortest cut towards Holloway, he said he was going the whole distance, and beyond, and should be happy to show me the nearest road; adding, that he supposed I was desirous of getting to bed, 'which I,' said he, 'have just left, to begin my day's work.' 'A strange hour,' thought I, 'to begin a day's work; not yet one o'clock.' And as I walked behind him through the narrow and dirty lanes of that neighbourhood, I availed myself of the accommodation afforded by the gas-lamps to scrutinise his figure and costume. Of a slim and wiry make, and of the middle size, and about thirty-five years of age, I saw from his motions that he was active, agile, and a stranger to fatigue. His whole dress fitted his muscular frame almost as closely as that of Harlequin himself, but was composed of the vilest materials; half-leather, half-cloth, greasy, and rent, and patched and re-patched in a hundred places. A short pair of hobnailed Bluchers encased his feet; and a skull-cap of leather, guiltless of the smallest indication of a brim, covered his head, fastening under his chin by a strap. At his back hung a long, shallow, wicker-basket, with a canvas covering: this was strapped round his waist. He was accompanied by a small, black, and ugly half-breed terrier—an old hand, evidently, for he lost no ground, but kept uniformly before his master, and if he outran him, never returned upon his track, but waited quietly till he came up.

'That is a prudent dog of yours,' I said, as we emerged into a wider thoroughfare, and walked side by side.

'Ay, sir; he has learned prudence in the same school as his master. He was wild enough in his young days like myself; and, like me, he has found out that if he would be of any use to-morrow, he must take care of himself to-day.'

'You said you were just beginning your day's work; may I ask what is your occupation?'

'Occupation, properly speaking, I have none, sir—worse luck! I am one of a good many, driven from a

thriving trade by modern machinery and improvements. You must know, sir, I was brought up to my father's trade, that of a calenderer; and a very decent property the old man left when he died. Four thousand pounds there was in the three per cents., which I, like a fool, prevailed upon my poor old mother to throw into the business, for the sake of extending it, thinking I could make five-and-twenty per cent. of it instead of three; and so I might too, but for new inventions, which threw me out of the market, and brought us in the end to ruin. I sometimes thank God the old lady didn't live to see the upshot of it all. We passed her grave, sir, two minutes ago, in the Spa-Fields' burying-ground. Well, sir, when it was all over, I paid a good dividend; and the creditors, seeing how the matter was, gave me a couple of hundreds to begin again with. So, being always fond of books, and having a fancy for the trade, I thought I might do well enough—having only myself to look after—in a bookseller's shop; so I took a neat house in the New Road, and laid out all my money in books, and sat myself down behind the counter to wait for customers. Perhaps you would not think it, but there I sat from Monday morning till Saturday night without seeing a soul enter the shop except one child, who wanted change for a sixpence; and yet five or six thousand people passed the open door every day. The second week was not much better; few people came, and those who did come, wanted the books for less than they cost, and assured me—which I afterwards found was true enough—that they could get them for less elsewhere. The business never came to anything, as you may suppose. In the course of six months I found out, what I ought to have known at first, that I didn't understand it; so I closed with a man who offered to take the stock at a valuation, and relieve me of the house. A rare valuation it was! All the volumes were lumped together at sixpence a-piece; and I saw the major part of them a week afterwards bundled into a great box at the door, and ticketed "Ninapence each." I received something less than a fourth of the original cost of the whole, and walked out, not particularly well satisfied, to try again.

'I was afraid to venture upon any other business, and therefore looked out for a situation of some sort. If I could have written a decent hand, I might perhaps have got a berth as under-clerk; but nobody could ever read my writing; and though I threw away five or six pounds to an advertising teacher, who sports a colossal flut and goose-quill on his signboard, all my endeavours to mend it were of no use. I need not trouble you with the fifty attempts I made to gain an honest livelihood, further than to say that they were all for a long time failures. My money went by degrees. As I grew older I grew poorer, and went down of course in the social scale. I have been warden in a jail, whence I was turned out because a highwayman, whom I had compelled to good behaviour, swore I was an old associate; I have been a pedlar, and robbed of my pack on Duddham Down; I have been a billiard-marker, and kicked out by the proprietor because I would not score more games than the players had played; I have been cabman and hackney-coachman, till the omnibuses cut the cabs' throats; I have kept a fruit-stall on the pavement edge till it wouldn't keep me; I have hawked about the street every possible commodity you could mention; I have driven cattle to Smithfield, and thence to the slaughter-house; I have sold cats'-meat and dogs'-meat, and dealt in bones and rags; in short, I have done everything but beg, and have lived a whole week upon sixpence, because I would not do that.'

'I hope things are not so bad with you just now?' said I, desirous of hearing the conclusion of his history.

'Not quite, sir: there is truth in the old proverb, "He that is down can fall no lower." At first I suffered a deal of mortification from the neglect of friends of prosperous days, who were very liberal of their compassion and condolence, which are things I hate, but chary of everything else. I believe I conferred an

obligation upon them all, when I resolved, as I soon did, never to trouble them again.

'One fine morning, after walking the streets all night for want of a bed, I found myself in Covent Garden market at sunrise, among a shoal of carts and wagons loaded with vegetables for the day's sale. The thought struck me at once that here I might pick up a job; I commenced the look-out in good earnest, and wasn't long of getting employment. I received threepence for pitching a couple of tons of cabbages out of a wagon, and scoring them off; but then I was only a deputy, and was paid half-price. This, however, procured me a breakfast, and gave me heart to try again. I picked up three shillings altogether in the course of the day, two of which I paid in advance for a regular lodging for the following week—a luxury I had not then enjoyed for some months. The next day was not a market-day, and I did not manage so well; but I stuck by the market, and learned many modes of earning a penny. I bought vegetables at a low price, or got them in return for my labour; these I sold again, and managed to earn something, at all events, every day. Once, on taking potatoes to a baker who purchased all I could get, I was asked for mushrooms, for which the old chap had a mighty relish. I promised to get him some, but found them too dear in the market to allow any margin for me; so recollecting that I had seen a vast number the year before in a certain part of the Barnet Road, during my experience as assistant drover, I set off on an exploring expedition. Having arrived at the spot, after a pretty close search, I succeeded in gathering a tidy crop, though not without a good deal of labour and inconvenience. I found that the sale of these paid me well for my trouble. I often make between three and four shillings by a trip, and sometimes more. But I soon found out that others reaped that ground as well as myself; and to keep it pretty well in my own hands, I find it necessary to be on the spot before the sun is up. By this means I get more; and what is of greater importance, they are of better quality.'

'And pray, does your dog perform any part in the business, or is he merely a companion?'

'Why, sir, I daresay dogs might be taught to hunt mushrooms as well as truffles; but there is no occasion for that, as mushrooms grow above ground, and can't well be missed. But my dog's part is to mind the basket, and he does the business well. You see I leave the harvest to his care, while I scramble through hedges and over ditches and fences in search of more. I saw you quizzing my surcoat; 'tisn't much to look at, but it serves my purpose better than a coat with two tails. I can ram my head, in this thick shoe-leather cap, through a quickset-hedge, where a fox would hardly follow me; and when I have got this small bag full (producing a canvas bag from his pocket), I return and deposit them in the basket till the work is done. I am back again in the market by the time the housekeepers are abroad purchasing provisions for the day. My stock never hangs long on hand; and it is very seldom that I am reduced to the necessity of lowering my price, or consuming them myself.'

'This is a laborious calling,' I said, 'and one that cannot be very remunerative, or allow you to make much provision for the future.'

'Not much, sir, it is true; but yet I do make some. I save a shilling every week at least, and sometimes, in a lucky season, as much as five: that goes into the savings'-bank, and would suffice to keep me out of the hospital in case of illness, which I don't much fear, being a teetotaler, and pretty well weather-proof. I think it was Dr Johnson, but I won't be certain, who said, "No man ever begins to save unless he has a prospect of accumulation." I don't think that is altogether true; at any rate if it is, I am the exception that proves the rule. I began to save, strange as it may sound, because I did not know what to do with my money. Having learned by necessity to live upon the smallest possible amount, I was afraid, when my gains

exceeded that, of again acquiring luxurious habits, which it had cost me so much to get rid of; for that reason I put the first five shillings into the bank, and have added to it weekly, with very few omissions, ever since. I will not deny that, with the gradual increase of my little hoard, a new prospect has opened for me, and that I only wait for the possession of a certain amount to begin business in the market upon a more respectable footing, which will allow me to dispense with my midnight labours.*

Here he ceased; and soon after arriving at the corner of the street in which was my own home, I bade him good-morning; and wishing a speedy and prosperous result to his economic endeavours, parted with the mushroom-hunter.

HISTORY OF THE BANK OF ENGLAND.*

A WORK with this title has come under our notice, which is full both of amusement and instruction—amusement even of a romantic character, and instruction of that kind which operates upon the mind rather by suggestive facts than dry reflection. We propose running through the volumes in such a way as to collect some general and popular idea of the history of the great institution referred to; and we shall thus be able to afford a better notion of the varied contents of the work than we could hope to give by means of the scanty extracts to which our space would limit us.

During the Civil War, when our merchants were unwilling to be robbed for the good of the state, they were in the habit of keeping their treasure in their own houses under lock and key. But their servants and apprentices were sometimes of a more patriotic character. Nothing would satisfy them but a share of the blows that were going; and in order to be able to serve their country, they made no scruple of carrying off the money intrusted to their guardianship. In such cases it usually happened that they were never more heard of. This made the merchants who had still anything to lose, and the servants who were honest, and still trusted, very uneasy under such a charge; and it became the custom, for the sake of security, to lend whatever money was not in use to the wealthy goldsmiths. The rich were glad to make the deposit without interest; but more necessitous persons received fourpence per cent. per diem, and the goldsmiths realised a handsome profit by lending at a much higher usance to persons of real solidity, whose pecuniary matters were embarrassed by the troubles of the time. By and by they extended their business; they discounted bills; they advanced money to government on the security of the taxes; and the receipts for the cash lodged in their houses passed current from hand to hand under the name of Goldsmiths' Notes. The goldsmiths, in fact, became bankers, till the two businesses were separated by Mr Francis Child. On the site of his banking-house stood formerly the shop of Mr William Wheeler, goldsmith and banker, with whom Child was an apprentice. The apprentice married his master's daughter, as was frequently the case in the good old times; and at the death of his father-in-law, sinking the shop, he established a great banking business, which remains in full activity and undiminished respectability to this day.

The exact date of the commencement of this concern is not known, but its existing books go back to the year 1620. Hoares' began in 1680, and Snows' in 1685; and about the latter date a Bank of Credit was tried, but does not appear to have met with success. The want

of a great bank was so sensibly felt, that the idea became an *ignis-fatuus* of enthusiasts, and was made a stalking-horse by projectors. Nothing was talked of, nothing thought of, but money. Lottery upon lottery turned the heads of the people. Engulfed treasures were to be rescued from the bottom of the deep; pearl-fisheries were to pay impossible per centages; joint-stock companies juggled and cheated as an example to later times. At this moment an individual rose conspicuously amid the crowd, whose teeming brain originated the Bank of England* and the fatal Darien expedition.

William Paterson was a native of Dumfriesshire; and was educated for the church; but although he visited the West Indian islands on pretext of converting the heathen, it is supposed that he attached himself to the roving expeditions of the bucaniers, either as a spectator or comrade in their adventures. On his return to Europe, he brought into the affairs of everyday life a brain heated by such an education of circumstances, and an imagination fired by the stories related by the wild men of the sea of mines of gold and gems, and rivers with Pactolean sands. His Darien scheme we can only allude to. Rejected in England, and in various continental countries, it met with so warm a reception among the poor and cautious Scotch, that they rushed to subscribe to the Company, as Sir John Dalrymple tells us, with an eagerness not exceeded by that with which they signed the Solemn League and Covenant. Every effort was made to crush the Company at the outset, more especially by the English ministry and parliament, who, among other reasons for their hostility, feared that if it succeeded, the Scotch would in time become so powerful as to separate themselves entirely from England. Nevertheless, in 1698, twelve hundred colonists, under the conduct of Paterson himself, sailed from Leith, and arrived in due time at the golden isthmus, where, instead of unheard-of treasures, they met only with disease, famine, the sword, and, above all, the determined hostility of the English government, which issued proclamations in the West Indies forbidding supplies to be furnished to the Scotch at Darien. The result was, that they were obliged to abandon the colony; and of the whole body, only thirty, including the projector, ever saw again the pier of Leith. Such was the originator of the Bank of England, which, in spite of the most violent opposition from goldsmiths, bankers, usurers, and politicians, was incorporated by royal charter four years earlier than the Darien expedition, on the 27th July 1694.

There were at this period only four considerable banks in Europe—those of Amsterdam, Venice, Hamburg, and Genoa: the first three being merely establishments for the convenience of the merchants, and the last connected likewise, for its own advantage, with the state by means of a perpetual fund of interest on public loans. It was on the model of this Genoese bank that the Bank of England was planned, which began business in Mercers' Hall, and then removed to Grocers' Hall, where the twenty-four directors and fifty-four secretaries and clerks were seen at work together in a single great room. The salaries at this time amounted to £4350; and it appears that interest of three or four per cent. was allowed upon deposits. Paterson was in the direction only one year, when, after his ideas had been made use of, 'the friendless Scot was intrigued

* History of the Bank of England, its Times and Traditions. By John Francis. 2 vols. Third edition. London: Willoughby. 1848.

* Paterson is also generally represented as the originator of the Bank of Scotland, which was established by an act of the Scottish parliament in 1695. We shall by and by show some reasons for doubting his alleged concern in the origin of this bank.

out of his post, and out of the honour he had earned.' These, however, are not the words of Mr Francis, who is inclined to receive with caution such easily-made accusations. Godfrey, the zealous coadjutor of Paterson,—for between these two the Bank may be said to have been established—met with a sadder fate, after as brief a career. He undertook the difficult task of carrying specie to William at Namur, and while in conversation with the king in the trenches, was killed by a cannon ball.

The directors had at first no fixed remuneration, but submitted to what the general court chose to allow them. Dividends were paid quarterly; and so small was the business, that in 1696, according to an account delivered to parliament, the balance in favour of the Bank was only £125,315, 2s. Indeed for the first ten years it was engaged in a struggle for existence, and so low in its treasure, that it was sometimes obliged to cash, by quarterly instalments, notes payable on demand. The government, however, stepped in to its assistance. A new charter was granted, extending to 1700, and on such favourable terms, that we hear of great fortunes being made, and one of £60,000 by a bank director. The public at the same time was benefited by the lowering of interest, running notes and bills being discounted at three per cent., and money advanced on merchandise at four per cent. This was a great change from the time of the old goldsmiths, although that was only a few years before, when the ministry was now and then obliged to solicit the Common Council for an advance of one or two hundred thousand pounds on the land tax, at ten or twelve per cent., and when the common councilmen themselves went round from house to house in their respective wards for the loan of money.

The convulsions produced by the South Sea Scheme in 1720 did not affect the Bank of England unfavourably. On the contrary, by the subsequent purchase of four millions of the stock of that illusive concern, it cleared above £600,000. In 1722, by a new subscription, the capital of the Bank was increased to £9,000,000; and at the same time was commenced the well-known *resert*, or reserve fund laid aside for casualties, which has increased with the increase of the business, and has frequently proved of great service. In 1726 we find that no notes were circulated of less value than £20. The Bank removed in 1734 from the hall of the Grocers' Company, and established themselves in Threadneedle Street, on the site of the house and garden of Sir John Houbton, first governor of the establishment. The new office was comparatively a small structure, almost invisible to passers-by, being surrounded by private dwelling-houses, a church, and three taverns. In 1742 the charter was reconstructed, and forgery on the Bank, and trust-breaking on the part of its servants, were declared capital felonies. In the famous 'forty-five,' when the Highland army was at Derby, and London in momentary expectation of being sacked, we find the Old Lady of Threadneedle Street employed, somewhat indecorously, in warding off a run upon her, by employing her own adherents to present themselves foremost of the crowd with notes, for which they were paid in sixpences. This gained much precious time, without the sacrifice of specie; for the friendly creditors, making their exeat by another door, immediately returned their small change to the treasury. About the same time she attempted a meaner, as well as a less successful trick upon her rival Childs', by collecting about half a million of their receipts, and sending them in at a single blow. The wary bankers, however, had got scent of the plot, and were provided with a cheque upon the enemy for £700,000, drawn by the celebrated Duchess of Marlborough. When the notes were presented in a great bag, they were examined singly, to give time for the cheque to be cashed in Threadneedle Street; and the malicious Old Lady was then paid in her own notes, which, chancing at the time to be at a

considerable discount, a large sum was made by Childs' upon the transaction.

The first forgery took place in 1758, after the Bank had freely circulated its notes for sixty-four years. The criminal was Richard William Vaughan, a Stafford linen-draper, who was tempted to the deed by nothing more than a desire to pass for a rich man. At this time it was decided that the Bank was liable for the amount of stolen notes. In the following year, £15 and £10 notes were circulated for the first time, in consequence of an unusual scarcity of gold and silver. During the Gordon riots, we find the Bank engaged in actual warfare, with the old inkstands cast into bullets, and the clerks with swords by their sides instead of pens behind their ears. Military were posted within the walls lest matters should come to extremity; two assaults of the rioters were repulsed with great gallantry, Wilkes rushing out during the pauses of the fray, and dragging in some of the ringleaders with his own hands. Several persons were killed, and many wounded, in this skirmish, which inspired the directors with so wholesome a caution, that a military guard have ever since passed the night in the interior of the establishment. The officer on duty has a capital dinner for himself and two friends, and the hospitality of the City is said to be highly appreciated.

The Bank suffered more on an occasion of an opposite kind; for on the day of the proclamation of peace in 1783, the City was thrown into such a hubbub by the rejoicings, that the cashiers paid no fewer than fourteen forged notes of £50 each. This was the era of Charles Price, an exquisite rogue, who had tried dishonesty in almost every walk of life, and distinguished himself in all. Comedian—valet—lottery-office keeper—stock-broker—gambler—forger: such was the sequence of his career. 'He practised engraving till he became proficient; he made his own ink; he manufactured his own paper. With a private press he worked his own notes; and he counterfeited the signatures of the cashiers until the resemblance was complete. Master of all that could successfully deceive, he defied alike fortune and the Bank directors; and even these operations in his own house were transacted in a disguise sufficient to baffle the most penetrating.' His forgeries were so masterly, that some notes stood the examination of the ordinary Bank clerks, and were only detected (after payment) in passing through a particular department. He hired a servant by advertisement, whose curiosity was at length excited by being sent to purchase so many lottery tickets, and being always met on such occasions by his master in a coach, a foreigner apparently of some sixty or seventy years of age, with his gouty legs wrapped in flannel, a camlet cloak buttoned round his mouth, and a patch over his left eye. 'But had he known that from the period he left his master to purchase the tickets, one female figure accompanied all his movements; that when he entered the offices, it waited at the door, peered cautiously in at the window, hovered around him like a second shadow, watched him carefully, and never left him until once more he was in the company of his employer, that surprise would have been greatly increased.' The servant was at length taken into custody, and told all he knew; but his master had vanished like a spirit, and the forgeries continued as usual. Price now varied his labours by setting to work upon the genuine notes, adding a 0 to a £10 note, and transforming other figures so dexterously, that on one day he pocketed £1000. But the devil always deserts his friends at one time or other; and a note he had given in pledge for costly articles of plate with which he graced expensive entertainments, was clearly traced, notwithstanding all his dodges and aliases, to Mr Price the stockbroker. Upon this, seeing that there was no escape, he took the part of the hangman into his own hands, and the cross-road and stake were the meed of the forger. In those days it was dangerous for a man to look mysterious. George Morland, when skulking in the suburbs out of the way of his creditors,

fell under suspicion, and was so closely hunted by the agents of the Bank, whom he mistook for bailiffs, that he fled back into London. The directors, learning from his wife that the object of their pursuit was only a great painter, somewhat out at elbows in the world, presented him with a couple of their own engravings, passing for L.20 each.

The history of the suspension of cash payments in 1797, and of the subsequent act *restricting* the Bank from paying in cash, is too long for this abstract. We must content ourselves with saying that the establishment was embarrassed by the constant 'Give! give!' of Mr Pitt, who had all the world at war, and that the people, confounded by the signs of the times, ran in crowds to their bankers, in town and country, to demand money for notes. In order that the public might be put to as little inconvenience as possible, L.2 and L.1 notes were issued; and that the Bank was not really injured in its resources, was proved by its subscribing in the following year L.200,000 to the voluntary contribution for carrying on the war. In the first four years after the introduction of small notes, eighty-five executions for forgery took place. About the same time, the Bank was robbed by one of their cashiers, of the name of Astlett, to the amount of L.320,000. This man was condemned to death, but permitted to live in prison. Another cashier, of a very different character, and whose name is better known, Abraham Newland, died in 1807, worth personal property to the amount of L.200,000, besides L.1000 a-year in landed estates. This large fortune is accounted for by the profits on public loans, a portion of which was always reserved for the cashiers' office.

In 1816, the Bank had attained to such a pitch of prosperity, that a bonus was declared in the shape of an addition of twenty-five per cent. to the capital stock of each proprietor. An act of parliament was necessary for this, and the directors were authorised at the same time to increase their capital to L.14,533,000, at which amount it still remains. In 1821, Mr Peel's famous currency bill came into operation, and cash payments were resumed. A fraud of a bank clerk named Turner was discovered this year, and the delinquent escaped still more easily than the last. Owing to some failure in the proof, he was found not guilty, and betook himself to the banks of the Lake of Como with his spoil, amounting to L.10,000. In 1824, Fauntleroy was not so fortunate. Although a banker and a gentleman, he met the death of a felon on the gallows. This was another bubble epoch. The country laboured under a plethora of capital, and cured itself by bleeding till vitality was almost extinct. 'All the gambling propensities of human nature,' says the Annual Register, 'were constantly solicited into action; and crowds of individuals of every description, the credulous and the suspicious, the crafty and the bold, the raw and the inexperienced, the intelligent and the ignorant; princes, nobles, politicians, placemen, patriots, lawyers, physicians, divines, philosophers, poets, intermingled with women of all ranks and degrees—spinsters, wives, and widows, hastened to venture some portion of their property in schemes of which scarcely anything was known but the name.' The result was as usual: and, as usual, the wits sported with the national calamity, one of them advertising a company for draining the Red Sea, in order to get out the valuables dropped therein by the Children of Israel during their passage, and the Egyptians in their pursuit. When the reaction came, the Bank added to the consternation by contracting its discounts. Banker after banker came toppling down, both in town and country, to the number of seventy-three in a month; trade was at a stand-still; and the public panic made everything still worse than it was. 'The gloom which pervaded the metropolis was universal. A vague feeling of uncertainty as to the issue ripened into an indefinite dread of consequences, almost as harassing as the worst reality. A general bankruptcy seemed impending. The impression—for it scarcely

amounted to a conviction—that the Bank itself, hitherto regarded as almost sacred, was sharing the danger of the time, added to the general anxiety. Up to this period, with the single exception of 1797, the term 'Bank' had been synonymous with safety. When, therefore, it was believed that, amid the general wrack and ruin, even the Bank of England was in danger, the great hall of the establishment witnessed an eager proffer of notes in exchange for gold, which, however, was met as promptly as it was made. No attempt was offered to withhold, as in 1797; no attempt to delay, as in 1745. It was probably partly owing to the unhesitating readiness with which the gold was paid as fast as it could be demanded, that the confidence of the public was so quickly restored. Had the holders of the notes felt that there was anything like hesitation, the alarm would have spread indefinitely, and the Bank must have suffered in proportion. 'Gold! gold!' was the cry on all sides; and it was answered by another coinage as well as that of the Mint. Counterfeit sovereigns appeared with the new national issue, and were eagerly taken, because they *looked* like money. A re-issue of small notes was still more essential; for in fact a great portion of the distress was owing to so many persons finding themselves destitute of a currency wherewith to carry on the business of life. The small notes, according to Mr Harman, 'saved the country;' and within a week after their appearance, the storm died away, and men were at leisure to clear the wreck. The projects brought during the mania into the market had nearly 6,000,000 shares, and required a capital of upwards of L.372,000,000. In the two years 1824 and 1825, L.25,000,000 was actually advanced by the English nation on foreign loans.

The establishment by the Bank of branch banks in the provinces appears to have excited much trading jealousy; but as these establishments at the present moment number only thirteen, there could not have been much cause for the feeling. During the reform fever in 1832, the Bank sustained the last run upon its gold made from political causes. In the same year the English nation made a vast onward stride in civilisation, by entirely remodelling the useless and brutal system of capital punishments. Forgery of bank notes was one of the crimes exempted, although the forgery of wills and powers of attorney was continued on the black list for a few years longer.

We have not thought it necessary to encumber this article with an account of the various renewals of the Bank charter. We may say, however, that it grew into a usage for the privileges of the incorporation to be *sold* to them by government from time to time. But we must not omit to say that the last renewal, in 1844, fixed the extent of the paper circulation at L.14,000,000; namely, L.11,000,000 on the security of the debt due for the public, and L.3,000,000 on Exchequer bills and other securities; and arranged that every note issued beyond that sum should have its representative in an equal amount of bullion. This year was distinguished in another way by the frauds of Fletcher and Barber, which excited much speculation at the time, chiefly on account of the doubt which appeared to exist of the guilt of the latter. The forgery of Burgess in the following year is likewise too recent to have been forgotten by our readers. This year is the epoch of the great railway mania, of which we are now witnessing the close, and counting the cost. 'The history,' says a London banker, 'of what we are in the habit of calling the "state of trade" is an instructive lesson. We find it subject to various conditions which are periodically returning; it revolves apparently in an established cycle. First we find it in a state of quiescence—next improvement—growing confidence—prosperity—excitement—overtrading—convulsion—pressure—stagnation—distress—ending again in quiescence.'

We must now allow Mr Francis to describe the office of the Bank in his own words. 'The interior arrangements of the Bank of England are not the least remark-

able part of its economy. The citizen who passes it on his way to his counting-house, the merchant who considers it as an edifice where he gets his bills discounted or lodges his bullion for security, and the banker who regards it in his daily visits only as a place to issue the various notices that interest him, look on it with an indifferent eye. Even to the stranger its external appearance is almost lost in contemplating the nobler structure which looks down upon it. But to visit its various offices, to enter into the mode in which its affairs are conducted, and to witness the almost unerring regularity of its transactions, cannot fail to excite admiration. The machinery of Manchester on a small scale may here be witnessed. The steam-engine performs its work with an intelligence almost human, as by it the notes are printed, and the numbers registered, to guard against fraud. When the spectator passes from building to building, and marks each place devoted to its separate uses, yet all of them links in one chain, he cannot fail to be affected with the grandeur of that body which can command so extensive a service.

'The most interesting place connected with the machinery of the Bank is the weighing-office, which was established a few years ago. In consequence of a late proclamation concerning the gold circulation, it became very desirable to obtain the most minute accuracy, as coins of doubtful weight were plentifully offered. Many complaints were made that sovereigns which had been issued from one office were refused at another; and though these assertions were not perhaps always founded on truth, yet it is indisputable that the evil occasionally occurred. Every effort was made by the directors to remedy this, some millions of sovereigns being weighed separately, and the light coins divided from those which were full weight. Fortunately the governor for the time being, before whom the complaints principally came, had devoted his thoughts to scientific pursuits, and he at once turned his attention to discover the causes which operated to prevent the attainment of a just weight. In this he was successful; and the result of his inquiry was a machine remarkable for an almost elegant simplicity. About eighty or one hundred light and heavy sovereigns are placed indiscriminately in a round tube; as they descend on the machinery beneath, those which are light receive a slight touch, and this moves them into their proper receptacle, while those which are the legitimate weight pass into their appointed place. The light coins are then defaced by the sovereign-cutting machine, observable alike for its accuracy and rapidity. By this 200 may be defaced in one minute, and by the weighing machinery 35,000 may be weighed in one day.'

The following is an account of the *personnel*.—The supreme management of the Bank is vested in the whole Court of Directors, which meets weekly, when a statement is read of the position of the Bank in its securities, bullion, and liabilities. The directors have equal power, and should a majority disapprove of the arrangement, they might reconstruct it. Eight of them go out, and eight come in, annually, elected by the Court of Proprietors; and the system on which the affairs of the Bank are conducted is of course liable to change, as new directors may exert their individual influence on it. A list of candidates is transmitted to the Court of Proprietors, and the eight so recommended uniformly come in. Quakers and Hebrews are not eligible, although many are so well versed in monetary matters. When an individual is proposed as a new director, inquiry is always instituted concerning his private character.'

The Bank, as we have seen, commenced business with fifty-four assistants, whose salaries amounted to £4350. The total number employed at present, according to Mr Francis, is upwards of 900, and their salaries exceed £210,000. Of this sum the governor receives only £500, and the directors £300 each; but these gentlemen doubtless are remunerated in another way.

Having now skimmed these interesting volumes, with Macpherson's 'Annals of Commerce' open before us, so far as they go, we have only to beg our readers to understand that Mr Francis is a devout admirer of the Bank of England throughout its whole history—any incidental remarks of our own which may be supposed to have another tendency notwithstanding.

THE OLD FLEMISH BURYING-GROUND.

AMONGST a widely-spreading relationship we reckoned the Flemish Quaker family of the Vanderheims, although circumstances had occasioned the ties of kindred to be overlooked or forgotten on both sides for many years. But at length circumstances led to a renewal of friendly correspondence and association, and to my becoming an inmate of their dwelling for a considerable time. This dwelling, with its gray and sombre aspect, had once formed part of an old convent, whose name, usages, and traditions had not altogether passed away, although they were refused a place in the memory of the Society of Friends. These good people found its spacious hall, vaulted chambers, great gates shutting out the world, and cloisters running round a square courtyard of shaven turf, with a sun-dial in the centre, surrounded by flower-beds, exceedingly agreeable to their peculiar habits and tenor of being; yet all peaceable and kindly as were their dispositions, they evinced undisguised repugnance when any allusion was casually made by the curious stranger touching on the bygone tales attached to their beloved home. The Vanderheims were among the commercial chiefs presiding over the quaint grass-grown Flemish town where they resided; whose green ramparts were unceasingly paraded by a few sentinels, ever keeping watch in mimic state. The town itself was as dull and slumberous-looking as the genius of its inhabitants, nestling amid waste dreary-looking sandhills, surrounding it on three sides, and stretching to the sea, while the fourth side presented an inland expanse of flat uninteresting country, interspersed with canals, and dotted here and there by a solitary windmill or a clump of stunted trees.

Coming from a gay French resort with elastic spirits and a free buoyant heart, this sojourn among my Quaker relatives apparently offered but slight prospect of enjoyment; and nought save a sense of necessity and obligation could have reconciled me to it, more especially on being introduced for the first time to three demure female cousins, my seniors by so many years, that with girlish impertinence I set them down as starched, cross-grained old maids. But this crotchety passed away like other follies of youth and inexperience; and I now look back on the many monotonous hours passed in that quiet Flemish dwelling, with the youngest of these 'cross-grained' cousins for my sole companion, as on the most tranquil and smooth, if not the happiest portion of my life.

The strict unvarying regularity of the household arrangements, unbroken by hopes, fears, amusement, or excitement of any description, was only varied by the perambulations which I was permitted to take in company with Rahel Vanderheim, for whom walking exercise was prescribed by her medical attendant. She it was who readily undertook to make me by degrees an excellent pedestrian, and who daily brought bouquets of roses to my room; roses so exquisite in colour, rich in perfume, and peerless in form, that I became curious to learn from whence they were procured. The gardens in and around the town were far too scanty to afford a profuse supply; and if the honest Flemings coveted the possession of the blushing beauties as much as I did, there must be plenty of roseries *somewhere*. Rahel reminded me that the canals afforded easy means for the transport of all necessities—flowers and vegetables being thus mostly brought from a distance; and the flower-market offering a pleasing picture in the early morning-time, ere the nosegays were sold and dispersed, she promised to take me to see it. My grave cousin, however, reproved at the same time the enthusiasm with which I spoke of this.

'Thee indulgest too much warmth of speech,' said she gently, 'for a discreet young maiden; these shouldst remember that, like these fair short-lived blossoms, thee too must fade and die: perchance didst thee know from whence these roses come, thee mightest not prize them so highly!'

'Come whence they may, Friend Rahel,' I laughingly exclaimed, 'they pass through your dear good hands, and must be purified by the process.' But a demure shake of the head was the only rejoinder, with whispered words of a lesson to be read from the serious pages of real life on the first convenient opportunity.

One bright summer's morning, when the sun had just risen above the ramparts, and the first slanting beams had not yet rested on the gay parterres around the dial, we sallied forth from the Vanderheim cloisters. I accompanied Rahel to the distant quarter of the town where the market-place was situated. Arrayed in a little close bonnet, and pretty modest cap plaited around her sweet delicate face, with a basket in her hand containing condiments of various descriptions, she looked the personification of benevolence, or a sort of *Sœur de Charité*, though in a different costume. The market-place was bounded on one side by the church, a fine old cathedral structure, the flower department being arranged beneath its sheltering walls, and forming an alley of sweets, picturesquely contrasting with the gray mouldering background. Near the end of this alley, and piled against a buttress of the sacred edifice, was a far more splendid collection of fresh and blooming roses than I had ever seen before, except in a highly-cultivated roseroy; and there I doubt if they are found as remarkable as these, which had a peculiar richness and depth of colour, while they loaded the air with a perfume as delicious as if exhaled from a golden vase of veritable Persian attar.

The attendant fairy of the flowers was a young and innocent-looking Flemish damsel, who curtsied to Rahel with the welcoming smile of old acquaintanceship, speaking to her in their native dialect, which of course I could but slightly comprehend. I knew enough, however, to make out that they were no strangers to each other; that Rahel inquired concerning the health and wellbeing of an aged grandfather; and that the girl's name was Mimi: the contents of Rahel's basket, moreover, were intended for this aged grandfather's especial use and benefit, while tearful eyes, grateful looks, and repeated curtsies on the part of pretty Mimi, acknowledged the kindness and solicitude of the good Rahel Vanderheim; and such a profusion of fairy roses were forced upon our acceptance, that surely never before had dirty *sous* been so profitably and delightfully exchanged.

On our homeward route, a rhapsody from me in praise of my blooming treasures was suddenly interrupted by Friend Rahel in these grave words: 'Maiden,' said she, 'these are roses of the Dead—reared amid desolation and decay, and thriving on mortality's corruption: many there be in this good town who would reject with aversion poor Mimi's gift of flowers from old St Lovendaal.' I cast a half-frightened glance on my lovely bouquet, half fearing to see it vanish away, even as the fruit found by the Dead Sea turns to ashes when about to be enjoyed; but notwithstanding Rahel's dislike to mystification, she deferred expounding the riddle until the following evening, when, after a long wearisome walk amid waste sand tracts, by the side of tame sluggish canals, we came to some broken ground, just sufficiently elevated to screen near objects from observation; and there, hidden in a hollow, partially surrounded by ancient yew-trees, was a deserted burying-ground.

The peasant liked not to pass that way at evening-fall; and as no road approached it, and it led to nothing, and nowhere, there it kept its long Sabbath of repose, resting in solitude and desolation. It was a quiet, holy spot, a few miles only from a populous town, but rising here a green oasis in the desert. Skulls and bones were scattered over the loose sandy surface; and here were curious moss-grown monuments; sunken headstones, with defaced inscriptions; quaintly-sculptured urns; broken

railings hung with wild festoons; but amidst all this array of decay and death, innumerable rose-trees in full and gorgeous bearing arose in graceful life-like pride, shedding their perfumed sweets over all, and silently keeping watch above the dead. They were evidently well-tended and cultivated—and this was indeed a unique and solemn roseroy.

Beneath a spreading yew-tree stood a cottage, or rather a hovel (for it deserved no better name), and on a low stool before the door sat a blind man, of extreme age, whose long silver locks floated on his shoulders; the sightless eyes turned towards a golden sunset, the white lips moving silently, as if in prayer. A young girl advanced hastily towards us with delighted exclamations: it was Mimi, the Flemish flower-girl—and this was St Lovendaal's.

How many of these ancient graves the old man before us had helped to form it was impossible to imagine: he had been the sexton for more than half a century, and was still permitted by the authorities to occupy the same cottage where he had always dwelt.

Here his wife and all his children slept around him; Mimi being the only one of his numerous family whom God had spared to solace and support his declining life. Well and faithfully had the good granddaughter performed her appointed duty; working early and late, summer and winter, the industrious girl, by knitting warm worsted hose and caps, so much prized by the comfortable Flemings, and by the produce of her roseroy, was enabled materially to assist in supporting the blind old man. Mimi was too proud to be the recipient of mere charity; and many townsfolk who knew her well, and respected her pious and patient endeavours, aided her honest labours by becoming ready and liberal purchasers of her handiwork; so that in fact Mimi had always orders to execute, and never remained idle. It was not so easy to dispose of the produce of her solemn garden, that being often rejected with superstitious abhorrence; and the florist's trade might not have thriven so well, had it not been for 'friends at court,' in the semblance of church officials; for during all the sacred ceremonies and summer fêtes of her religion, Mimi's lovely roses were in high request for church decoration and embellishment.

But when the season of flowers was over, and the wintry winds swept across the dreary sand tracts—when the murmurs of the distant ocean seemed to whisper an unceasing dirge for the dead—then this must have been a trying and isolated position for a young and timid maiden. Mimi had been urged to quit her desolate home, and to take up her abode with her venerable grandsire, in a comfortable dwelling, sheltered and surrounded with flourishing orchard trees, where honey-bees and fair garden ploats abounded; for young Peterkin the market gardener, whose large vegetable stall in the market-place was near the flower alley, had long loved and wooed her for his wife. But Mimi knew—for her grandfather had often said so—that the fragile thread of the old man's life would be snapped at once on leaving the spot where his life had been passed, and where all his cherished associations were centered. Here he found his way about alone, and visited the graves where his beloved ones slept.

'Moreover,' said Mimi with a blushing smile, 'if Peterkin really loves me, he must wait patiently; for grandfather, alas! has not many years to live. But the dear old man has a tender heart, and it would pierce him to think that his darling Mimi's happiness was only to be obtained through his death; so I have never allowed Peterkin to come here—grandfather knows nothing about it—and he never shall know that my love for him is shared by another. I am his sole earthly protector, though he often speaks of guardian angels being around us unseen. Ah, I would not lose grandfather's peaceful smile and fervent blessing for all else the world can give!'

Before quitting that Flemish town, I paid a last visit to St Lovendaal's burying-ground: it was during the early spring-time, and perfect solitude reigned around: the cottage was ruinous, and uninhabited, for the old man had been gathered to his fathers some months previously.

Mimi's face was seen no more at the stall beside the buttress of the gray cathedral church; but where greens and cauliflowers, mixed with bunches of wallflower, daffodils, and hyacinths, arose in towering heaps, the pious daughter, now the industrious and happy wife, still looked the same sweet patient Mimi as when presiding over the fairy roses from old St Lovendaal.

SUMMER EXCURSION IN GERMANY.

VIENNA TO PRAGUE AND DRESDEN.

On quitting Vienna on the 8th of June 1847, we did not anticipate that, before the lapse of twelve months, the Austrian monarchy would be shattered, and the emperor, poor little man, a refugee in the Tyrol! At the same time it was evident that affairs were not in a healthy condition, as they indeed never can be where a government rests its authority on armed force, and strives to keep the people in a state of child-like tutelage. An impression of this kind was not lessened as we proceeded on our journey.

At seven in the morning we left Vienna by railway into Bohemia, and at ten at night arrived in Prague, the capital of that dependency of the empire. The road makes a considerable detour by way of Olmütz; and the trains, besides frequent and long stoppages, have in some places only one line of rails. I may here, once for all, mention that the German railways seem to be well and carefully conducted. The trains seldom go at a quicker speed than twenty English miles an hour; the guards appear to be of the rank of subaltern officers in the army; and at almost every station time is allowed for taking a little refreshment—the offer of cakes, bread and butter, ham, and coffee, being generally made to the passengers. The Austrians being great eaters of sausages, these articles, of all sizes, were exhibited on the Prague line in great abundance. Another characteristic in German railway conveyance must not remain unnoticed: to every train is attached a carriage with a 'Rauche coupé.' This is a division in which passengers may smoke, and for which they can have a ticket on application. We generally kept as far away as possible from these odorous compartments. On the present occasion the journey, though slow, was not tiresome. Fortunately we were, for the most part of the excursion, in a carriage along with some gentlemen not indisposed to converse in French, and by whose agreeable manners the time was helped pleasantly away. One gentleman amused us not a little with an account of his efforts to learn English, the difficulties of which he declared to be altogether insurmountable. The word which had most puzzled him, and which, he said, he never could be made properly to utter, was *apple*; and he listened to our repetition of it with the deepest curiosity and wonder. Such is a specimen of the chit-chat with which tourists have sometimes an opportunity of whiling away the time in continental travelling.

The railway, in the first place, pursues a course up a valley yielding a small tributary river to the Danube; and by many bends and gradients, at length reaches the top of the high grounds which divide the valley of the Danube from that of the Elbe. Having attained this point, which is not an unpleasant rural scene, with here and there cottages of peasant farmers, an infant tributary of the Elbe, flowing towards the north-west, came into sight; and down the train went into the great basin of Bohemia—a beautiful country, in which vast fertile plains are bounded by mountains that seem to shut it out from the rest of the world. It is from this hollowed-out form of country that the Bohemians compare their land to a kettle. Darkness settled on the scene before we reached Prague; but, not to detain us at the terminus, an officer of police was admitted into the train a few miles from the town, and by him our passports were collected preparatory to their being *visé* on our arrival.

Prague, or, as the natives call it, Prag, is one of the

most curious old towns in Europe. Issuing in the morning from our hotel—the *Blaué Stern*, a modern edifice of immensely solid masonry, with a restaurant vaulted as if to be bomb-proof—we saw at a glance that, like Edinburgh, Prague possessed the air of a capital deserted by its nobles; and that houses of palatial grandeur, once the residence of princes, ambassadors, and abbots, and still ornamented with heraldic emblems, had sunk from their high estate, and now gave shelter to the meanest of the population. Prague, in short, is a wreck—a city ruined by the annihilation of Bohemian independence, and the flocking of the wealthier classes to Vienna. 'Whosoever the carcass is, there will the eagles be gathered together.' Edinburgh and Dublin, as well as Prague, are well acquainted with the operation of that Scriptural truth. Latterly, by means of some patronising attentions from Austria, but chiefly from a native spirit of revival, and by becoming a central point in railway transit, this venerable city has shown signs of reanimation, or at least improvement; and accordingly, in several places we observed new streets springing into existence, and that gas-pipes were being laid in the principal thoroughfares.

Situated on the two opposite banks of the Moldau, which are here connected by a long and substantial stone bridge, ornamented with the statues of saints, the city covers a large space of ground, level on the right or east, but rising into a hill on the left side of the river. The town is chiefly on the right bank; and embosomed among narrow streets, lined with tall dingy houses, in this division lies the *Judenstadt*, or *Jews' Town*, a quarter to which our guide took care to conduct us as one of the curiosities of the city. Approaching the margin of the river, though little benefited by its waters, the *Jews' Town* bears a considerable resemblance to the closely-huddled thoroughfares of the more ancient part of Edinburgh. A body of Hebrews settled here in very early times; and their descendants, notwithstanding the cruel persecutions of the middle ages, so effectually maintained their position, that they acquired the privilege of jurisdiction as respects their own affairs; and this the *Jews* of Prague continue to possess. For the greater part wearing a long black dress, and with unshorn beards, they are readily distinguished from other citizens. The higher class here, as elsewhere, are dealers in money and articles of value, while those of a humble rank attend stalls for the sale of such old trumpery as is exhibited at doorways in the meaner parts of London. I could not walk through the confined alleys, in which aged members of the community were observed to be engaged in this humble traffic, without a sense of shame; for to the intolerant exclusiveness of Christians is alone imputable the narrow choice of professions to which the *Jews* find themselves condemned. Let us hope, however, that this long-cherished prejudice against an inoffensive and ancient, not to say deeply-interesting people, is at length vanishing from Europe.

The first thing to which we were conducted in the *Judenstadt* was the old synagogue; certainly a very curious place. It is said to be nine hundred years old; but this is evidently a mistake, for the style is that of the pointed arch; and the probability is, that the edifice was erected not earlier than the fifteenth century. The floor being below the level of the street, we descended to it by one or two steps; and the appearance of the interior, which is small, with a dingy light, may very well have impressed the notion of an antiquity at least double the reality. The roof and walls are blackened like a chimney, by the smoke from the lamps and torches which on certain occasions are burnt for several days together. The soot and dust of centuries remain untouched, as if too sacred to be meddled with; while the old deal furniture, shabby and rickety, seems to be falling in pieces. I could not learn the cause of this remarkable condition, which cannot be neglect, because the place, though deserted for newer and grander edifices on ordinary occasions, is still in use

for the more ceremonial solemnities of the Hebrew worship. At one end, on an elevation resembling an altar, and beneath a canopy, repose the holy books of the law, in the form of two large rolls of parchment, ancient, and curious, and beautifully written. These and other objects of interest we were permitted to examine without any restraint. From the old synagogue we went to the ancient burying-place of the Jews, which was at some distance, among equally confined thoroughfares. It is a species of back-court, secluded within a wall, and as thickly covered with trees and shrubs as the vast number of stone slabs will permit to grow. Originally level in surface, the accumulations of five hundred years have swelled the ground into a kind of hill; and it being no longer safe to inter more bodies in the spot, burials have for many years taken place elsewhere. By pathways among the bushes we went round the enclosure, which is encumbered with what might be considered heaps of loose rubbish, but which in reality are piles of stones, that, in obedience to an ancient usage, common to other nations besides the Jews, have one by one been brought hither, to be laid on the graves of relatives, or of individuals eminent for their worth.

We now crossed the Moldau by the bridge, and ascended through winding thoroughfares to the summit of the high ground on which stand the royal palace, the cathedral, and other interesting edifices. As we advance, we are more and more struck with the contrast between the original grandeur of the buildings and their present state of decay. Some are in ruin, and everything in the lonely streets speaks of desertion and poverty. Near the top of the hill, from which a fine view of Prague is obtained, we visited a church and convent of Premonstratensian monks; and by one of the brotherhood—an aged gentlemanly person in a white woollen robe—we were admitted to see the large and valuable library of the establishment, which occupies one apartment fitted up with much taste. The polite old man showed us sundry bibliographical curiosities, including a book with the autograph of Tycho Brahe, which had been presented to the library by Baron Hassenburg. From this convent we proceeded to another, to see a rich collection of reliquaries and other articles; and from that we were conducted across an open piece of ground, under a burning sun, to view what was formerly the abode of the kings of Bohemia, but is now a provincial palace of the emperor of Austria. It is a building of enormous dimensions, occupying the summit of a knoll; the back part overlooking a garden which stretches down a steep bank in the direction of the Moldau. The house is fully furnished in the French style, and in the state and family apartments are some fine pictures of Poussin, Carlo Dolce, Holbein, and Guido; and what is more interesting, portraits of the family of Maria Theresa. In one of these rooms, high above the garden in the rear, took place (May 23, 1618) the deed of violence which precipitated the Thirty Years' War. This act, as will be remembered by the readers of history, was the forcible entrance of certain Protestant chiefs into the council-room, occupied at the time by Sternburg, Martinitz, Lobkowitz, and Slavata, with Fabricius as secretary—all in the Catholic interest of the emperor of Germany and his protégé the king of Bohemia. Not receiving, as they thought, a becoming answer to inquiries which they addressed to the council as to their participation in the cruel edicts of the emperor, the Protestant nobles unceremoniously showed Sternburg and Lobkowitz out of the room, and seizing on Slavata, Martinitz, and Fabricius, pitched them from the window into the garden beneath.* Strangely enough, and to the surprise of all concerned, their fall of eighty feet did not kill the unfortunate counsellors, their marvellous escape being accounted for by the circumstance of their landing on a dunghill which happened to be at the

foot of the wall. The window from which this unjustifiable outrage was committed is of course pointed out to strangers. The last thing shown to us in connection with the palace was an ancient Gothic hall, fitted up with a chair of state and other seats, and used by the Bohemian dignitaries when taking an oath of allegiance to a new imperial sovereign. The emperor, I was informed, rarely visits Prague—one of the circumstances among others that has given umbrage to the Bohemians, and excited them to aim at an independent existence.

Adjoining the palace is the cathedral—an ancient Gothic structure, which has suffered much damage, both from the headlong ravages of iconoclasts, and the military bombardments to which Prague has at different times been exposed. It has a number of aisles and side chapels rich in monuments of historical interest, and also in articles in the precious metals, which adorn the different shrines. The popular saint in Prague is St John Nepomuk—a personage of great piety, who suffered martyrdom towards the end of the fourteenth century. The figure of the saint is seen in various quarters, and here, in the cathedral, is his mausoleum, consisting of a crystal coffin cased in one of silver, and supported by finely-sculptured figures of angels of the same metal. Nearly two tons of silver are said to be expended on these and other objects in this much-venerated shrine.

In descending to the lower part of the town, a number of houses traditionally interesting were pointed out; among others, the mansion of the soldier of fortune, Wallenstein, celebrated for his deeds during the Thirty Years' War, in which he was an antagonist to the illustrious Lion of the North, Gustavus Adolphus. In the intervals of his mad military career, Wallenstein lived here in more than regal splendour; but all memorials of his magnificence are now gone, with the exception of a few faded frescoes in one of the upper apartments, and a portion of an open arcade towards the garden.

While closing the subject of Prague, I am painfully reminded, by accounts reaching England through the daily press, that that unfortunate city, so quiescent at the time of my visit, is at present undergoing all the horrors of civil war. In quelling the revolt of the citizens, the town has been bombarded, from the heights near the palace, by the Austrian commandant, and great numbers of its houses laid in ruins. Whether this terrible act of repression will finally secure Bohemia to the Austrian crown, is matter of extreme doubt to all who are acquainted with the country. The people of Bohemia are of the Slavonic race, speak the Slave language, and hate the Germans, whom they look upon as intruders and oppressors. In the single circumstance of the Bohemian insurrection, it is dreadful to contemplate the condition of insecurity into which even the greatest of nations may be brought by keeping a forcible, and therefore immoral, possession of a country which the accident of war, or family connection, has placed in their power.

From Prague we designed to proceed to Dresden, by a route which lays open what is called the *Saxon Switzerland*; a remarkable district of country, intersected by the Elbe, and therefore approachable by steamers. Though a river of considerable size, the Moldau, which falls into the Elbe, is not navigable except by rafts and barges; and on this account it was necessary to cross the country to Obristw, the highest point on the Elbe reached by steamboats. The distance being only fourteen miles, we drove across in a voiture, passing in the course of our journey numerous bands of male and female labourers engaged in cutting the Prague and Dresden railway, which, when finished, will complete the line of rails from Hamburg to Trieste. Obristw is neither a town nor a village. It is a German château, which the proprietor lets as an inn, reserving to himself the use only of certain apartments—not a bad arrangement for a poor baron, and far from being unworthy of imitation in quarters nearer home. The inn part is the upper floors of the mansion; and here,

* See History of the Thirty Years' War, 'Chambers's Miscellany of Useful and Entertaining Tracts,' No. 120.

with as good accommodation as is to be found on the continent, we spent the night previous to descending the Elbe. At early morn the expected steamer having made its appearance in a creek behind the house, it soon received on board a large number of tourists, among whom were Haulbach and other artists from Munich, who had accompanied us down the Danube.

This was an exceedingly agreeable day. The weather was beautiful, the company on board a very pleasant set of people, the scenery in some places picturesque almost beyond imagination, and the *cuisine* and the management of the boat left nothing to be desired in the way of physical comfort. It was the second time within a fortnight we had travelled by steam under English direction. The engine was English, and so were the captain and his clerk; a circumstance which somehow inspires confidence the greater our distance is from home. The early part of the voyage, which is within Bohemia, discloses few striking points, for here the land is generally level; but as we approach the mountain ranges that form the boundary with Saxony, and through which the river has worn for itself an opening, the scenery undergoes an entire change. As we approach this picturesque district, the boat stops at a village on the left bank to land passengers for Teplitz, a fashionable watering-place among the hills, at a few miles' distance. Farther down, on the right, the boat stops for a few minutes at Tetschen; and between this place and Schandau we enter the mountain gorges, and glide out of the Austrian into the Saxon dominions. At Schandau, the vessel pauses for half an hour, during which, while the officers of the Saxon police examine passports, the douaniers give themselves the trouble of plunging their hands into the various carpet-bags and boxes which are strewn along the deck. Liberated from this rather flurrying affair, the steamer is again on her way; and in viewing the superb scenery which lines the banks of the smooth-flowing Elbe, we forget the petty annoyances to which we had been recently exposed.

We are now in the Sächsischer Schweitz, a designation far from correct, for the country has no resemblance to Switzerland—no snowy Alps, no lofty serrated mountains, no lakes, and no glaciers. The district needs no false appellation to popularise its beauties. These beauties are very peculiar. In the early ages of the world, geologically speaking, Bohemia was the bed of a lake whose waters gradually subsided as they found an outlet through the mountainous region on the north. Had this region been composed of granite or trap-rock, Bohemia in all probability would still have been at the bottom of an inland sea. The rocks, however, were fortunately a sandstone of different degrees of hardness; some parts being so soft as to yield to the abrasion of the waters, and finally to allow the drainage of the country by what we now call the Elbe. But this was a long process, which has left curious memorials in the existing masses of rock that were too hard to be carried away as sand to the German Ocean. For many miles along the river, and the back country on both sides, are seen tall blocks of stone, some rising as slender and rugged pillars to a height of three hundred feet, and others forming huge knolls as high as eight or nine hundred feet, with precipitous sides, partially clothed in vegetation, and so difficult of access, as to have afforded in some instances sites for castles during an age of insecurity and rapine. To obtain a proper idea of this extraordinary piece of country, it is necessary to climb to the top of one of the loftiest cliffs, and thence look abroad on the water-worn excavations. Over a large tract are seen variously-shaped masses of rock rising abruptly from an undulating plain, while in the centre of the scene the river is observed to pursue a winding course between steep crags or rich patches of meadow, composed of débris washed from the heights above. The most favourable spot for viewing this remarkable district, which is not less interesting to the geologist than to the artist, is the Bastey, a few miles from Schandau. The

Bastey (Bastion) is a tall rounded mass on the right bank of the river, rising almost from the water's edge to the height of six hundred feet. Connected partly with the adjoining cliffs, which are hung with a drapery of green shrubs, the Bastey has been made approachable to the summit by means of wooden galleries and stairs. Around the top is a railing, to prevent accidents, and from the bartizan which it protects we have the pleasure of looking down in safety into the profound river course, on which the steamer is diminished in appearance to a toy. At the gorge at the foot of the Bastey is a country inn, whence a foot tourist, landed from the steamboats which daily ascend and descend the Elbe, may make a variety of exploratory rambles.

To aid the picturesque character of the district, the rock in the protuberant masses lies in horizontal strata, causing a resemblance to huge blocks of masonry. In some instances the softer material being washed from beneath the incumbent masses, great caverns have been formed; and one of these, the Cowstall, a vault open at each end, is one of the leading curiosities in the neighbourhood. What has been favourable to the picturesque, tends unfortunately to its own destruction. The cliffy banks of the river, owned in patches by proprietors who care more for florins than scenery, are in various places sinking under the quarryman's hammer; and already long stretches of the rocky precipices have, in the shape of square blocks, been despatched in barges down the Elbe to Hamburg and other cities of the plain.

Towards the termination of the rocky banks we pass on the right Lillenstein, and on the left Königstein, two of the loftiest hill masses; noted, as well as the adjacent heights, in the war of 1813, when Napoleon made the Elbe the base of his operations. On the level top of the Königstein is an ancient fortress which commands the pass of the river, and is so strong, as to have defied the gunnery of the French invading army. Passing these places of historical interest, and likewise several villages, we enter the level country at Pirna. Shortly we pass on the right Pillnitz, a palace occupied as a summer residence by the royal family of Saxony. We are now almost within sight of Dresden, which, occupying a low situation level with the river on its left bank, is speedily reached by the steamer; and here terminates our excursion by water.

SYMPATHY AND ITS ECCENTRICITIES.

SYMPATHY may well be considered one of the noblest attributes of man, and seems, as it were, the mark of his Divine origin. All his generous feelings—the readiness to 'rejoice with them that do rejoice, and weep with them that weep'—have their rise in sympathy—that great bond which unites the society of mankind, and tends to the good of all. Sympathy even subsists between man and the lower creatures in no inconsiderable degree. Every one knows how the dog and the horse sympathise with their master, and how many instances are on record of the attachment shown by various creatures of different species to individuals of the human race, and how much man's sympathy for the lower creatures has been made subservient to their comfort. Beattie, in his *Essay on Music and Poetry*, observes, 'sympathy with distress is called compassion or pity; sympathy with happiness has no particular name;' and Adam Smith, in his '*Theory of Moral Sentiments*,' defines it as 'a fellow-feeling with the passions of others'—that is, with such as we do not disapprove of. Neither of them, however, attempts to explain how its effects are produced—effects which we know are in a moment conveyed with all the rapidity of an electric shock. How it acts instantaneously on the nerves we cannot tell, but must rest satisfied that it is one of the phenomena of our being, depending, in the words of the learned commentator, Adam Clarke, 'on certain laws of nature, the principles of which have

not as yet been duly developed.' However, it is evident to all that without this gift life would be divested of happiness, interest, and pleasure. We are scarcely aware how many of our feelings originate in sympathy; from it associations spring, and that deep interest which we take in passing events in which we ourselves have no concern: it transports us at once into the pitiable situation in which we see others, although it may be that those who are placed in it are utterly incapable of feeling it themselves. Thus we feel the most tender pity for the dead and for the insane, and often blush for a fault or rudeness committed by those who are perfectly indifferent or unconscious that they have been guilty of such.

Actuated by sympathy, the patriot devotes himself to the service of others, identifying himself thoroughly with those who have inhabited the same spot of earth, and sacrificing every personal advantage to the attainment of some benefit for them. The patriotism of the dispersed race, and all their heart-yearnings after a home which they never saw, arises from a deep sympathy with those from whom they are sprung. The indulgence of this feeling, even when it casts a shade of the deepest melancholy, is attended by such a tender and exquisite enjoyment, that none would wish to forego it; and, as if it were to fix and strengthen it in the mind, it is called into action in mere matters of taste and fancy. An affecting tale, a pathetic air, a touching subject brought vividly before us by the painter's or the sculptor's skill—all awaken a sadness that is so pleasurable, that there is no greater gratification; the deepest tragedies are attended by crowds, and the nearer the illusions of the stage can bring them to reality, the more they please. Indeed when the representation is divested of an air of reality, or when a story in itself of an interesting character wants it, he no longer takes any satisfaction in them; while the wildest and most improbable fictions gratify, if the characters which they portray are made to act as would be natural in the situations in which they are placed—the reality of the portrait in one respect inviting our sympathy so as to make us forget its extravagance in another.

The susceptibility of genius to every touch of sympathy, and the power of awakening it in others, are perhaps its most distinguishing marks, and appear to be quite essential to its development. Whatever makes an impression on the man of genius excites some sympathy. In visiting ruins, he does not feel the mere pleasure of viewing them in their picturesque aspects, but finds a deeper interest in conjuring up to his imagination the remote times when they were as yet unscathed, and can sympathise with those who once trod the solemn aisles or lingered in the festive halls. His power of exciting the sympathy of others does not lie in the elaborate display and elegant finish of his art, whatever it may be, but in the earnestness with which he gives expression to his own feelings. Gluck was frequently heard to say, that when he was going to sit down to compose, he strove to forget that he was a musician—so necessary did he find it to give his whole mind to those passions which he wished to express. National ballads, composed under the influence of native scenery and feelings familiar to the clime, have such a powerful effect, that every one feels the justice of an observation made by one who well understood human nature—'It matters not who makes the law, provided you take care who writes the songs.' It has ample proof in the effect produced by the 'Ranz des Vaches' on the Swiss, when heard in lands distant from their home. All the tender sympathies linked with their native mountains and those they have left swell at the heart with such intensity, that they are frequently known to pine away and die of the fond yearning after home. Sir Joshua Reynolds once found himself affected to a considerable degree in the same manner. It was while he was abroad, that one evening, at the opera in Venice, an English ballad was played by the band, in compli-

ment to the English gentlemen who were present. It happened to be the one, which was the favourite in London when Sir Joshua was there. 'He had heard it played and sung in every street and in every company,' as we are told, by Allan Cunningham: 'it brought back fond and tender recollections of home, and longings after social intercourse with friends, and all the happiness and pleasure he had enjoyed: tears started to his eyes, and he returned to England.' One of the most engaging private singers that ever charmed an audience had no power of voice, but had such exquisite expression, as he adapted his lays to his native melodies, as never failed to awaken a responsive feeling in every bosom, and few could ever afterwards hear these airs without having their sympathies with the feelings to which the bard had given expression revived. The sympathy over which Handel had such power was, in his latter days, transferred from the subjects with which he had so long delighted the public to personal feelings for himself. As the sightless old man took his place at the organ, and threw his whole soul into a sublime voluntary, all listened with breathless veneration; but when his fine composition—

'Total eclipse—no sun, no moon—
All dark amid the blaze of noon'—

was sung by Beard with deep pathos, it was so descriptive of Handel's own situation, that everybody was affected to tears.

The skilful orator knows well that the most simple appeal to the sympathy of his auditors will produce an effect which all the ornaments of rhetoric would never achieve. It was this power of awakening sympathy that made Sheridan's memorable speech on the trial of Warren Hastings so effective, that it was absolutely necessary to adjourn the proceedings for some time, to leave an interval for feeling to subside; that judgment might not be warped. Kirwan, the celebrated preacher, whose eloquence drew together such immense crowds in the churches of Dublin, was so successful in his appeals to the sympathies of those who heard him, that the sums which he collected for various charities were quite extraordinary—many among his congregation not only emptying their purses, but stripping themselves of whatever ornaments they had about them. Rings, watches, and even the epaulets of officers have been found on the plate handed round for the collection. On one occasion, while he stood in the pulpit to plead the cause of the Orphan School, he was taken suddenly ill: he looked mournfully round, and then merely pointed to the children, who were ranged in the aisle beneath him, and almost fainting, said, 'Feed my lambs,' and burst into tears: the simple appeal touched every heart, and the collection on that day exceeded any he had yet made. But it is not alone in the excitement of the most tender and lively emotions that the power of sympathy is seen—it has frequently produced effects of a startling, and in some instances of a fatal nature.

The sympathetic feeling has been so overpowering in some cases as to cause death. Among several which are well authenticated, is one of a boy who was taken to see an execution, who became so overcome by pity, that he fell back and died. The same have been frequently known to lose their senses by being confined in madhouses with those who were out of their reason; and it has sometimes happened that those without a shade of superstition have caught its tone from those who were its victims. The earnestness with which Blake the gifted painter gave expression to the wild delusions of his fancy, in his conversations with the visionary beings in whose presence he so often imagined himself, so far influenced the sympathies of some acute and sensible persons, that 'they shook their heads, and hinted that he was an extraordinary man; and thus, were little short of acknowledging their belief in the reality of the enthusiast's illusions. His wife, who was ever by his side, and listened to his discourses with

those shadowy beings that he believed were with him, was firmly convinced that *he* both saw and heard them, though she could not. It is still more strange that many have been borne along the tide whose current they had previously been anxious to have seen 'stayed.' There is something very exciting in the 'affiliated' expression of popular feeling, and it has often happened that it has awakened sympathy in those opposed by judgment and sentiment to the cause which it passionately espoused, and led them on to act with the multitude. A young person well known to us went to one of those great meetings held in the south of Ireland in the year 1829 with feelings quite averse to the object of the assembly; but when he saw the crowd decked with their laurel branches, and found himself in the midst of the enthusiasm which pervaded all—when he saw handkerchiefs waving, and hats thrown into the air, and heard the loud acclamations of all about him—he felt his spirits become strangely agitated, and in a few hours returned to his home, his hat decorated by the distinguishing badge of the meeting—a huge sprig of laurel. It was thus with a lady of sober mind and sedate habits, whose conviction was against any faith in the unknown tongue, to which gift Mr Irving's church laid especial claim. She entered his chapel with a thorough horror of the delusion; but when she witnessed the excitement which prevailed—the eager attention of the congregation—the devoted and enthusiastic bearing of those who believed themselves suddenly endowed with the miraculous power—she felt very strange exciting movements in her mind; and as she listened to the wild jargon, she said that she was seized with an almost irrepresible desire to speak too in that mysterious tongue.

There is a very remarkable instance of the effect produced on a person of quick sympathetic feelings in the case of Charles Lamb, who went to see a farce which he had written, and for which he anticipated the most flattering success. Long before it was brought to a conclusion, loud and vociferous expressions of disapprobation sealed its fate; they were so vehement and hearty, that Lamb caught the infection, and his voice was loudly raised in the midst of the uproarious tumult, shouting with all his might and main, 'Off! off!' Adam Smith observes that our sympathy for others arises from our imagining ourselves in the same situation in which they are placed; it is this, he thinks, which makes us shrink and draw back our leg or arm when we see a stroke aimed and ready to fall upon the leg or arm of another. 'The mob,' he goes on to say, 'when they are gazing at a dancer on the slack-rope, naturally writhe, and twist, and balance their own bodies, as they see him do, and as they feel that they themselves must do in his situation.' Indeed this propensity to imitate the actions as we catch the feelings of others, is undoubtedly one of the distinguishing marks of sympathy. In Boerhaave's academical lectures on diseases of nerves, he mentions a very remarkable case of a young man who was under the influence of this imitative sympathy. He says 'he was addicted from his infancy to so great a degree of sympathy, that he would immediately imitate all motions made by others, and that without any inclination, and even against his inclination; insomuch that when he walked the streets he was obliged to look on the ground, to sit in company with his eyes shut, or to turn his face from his companions. If he saw a man shaking his head, that moment he would shake his own head; if he saw him laugh or smile, he would laugh or smile with him; if any one uncovered his head, he would do the same; if one danced, he would get up and dance along with him: in short, whatever he saw, he would mimic it immediately, in spite of himself. If his companions laid fast hold of him and tied his arms, and he then saw any one gesticulating and playing antics, he struggled hard to get loose, and felt within him the strongest motions, which he was not able to conquer. If asked what he was doing, he said he knew not, but was so

accustomed from his youth, and begged to be left alone, because his head ached from such motions, and he was greatly disturbed in mind, and withal as much fatigued as if he had done them of his own accord.'

Sympathy has indeed its eccentricities, and many of the mysterious nervous affections seem peculiarly under its influence. The coughing of one person often induces it in another, and every one knows how irresistibly catching yawning is. It is said to have frequently happened in crowded churches and other large assemblages, that when a female has been suddenly seized with hysterics, others have been quickly affected in the same way; and there are many instances of the same kind in schools, when girls, from witnessing a schoolfellow under an attack, have been suddenly seized with the same disorder. There are accounts on record of the spread of disorders which were neither contagious nor infectious, so that it would appear that the same state of the nerves which prevails in the sympathy that prompts imitation must exist in these strange affections.

It appears evident that any deviation in the affections from their natural course is productive of evil, and we may perceive that it is remarkably so with regard to sympathy; and yet though liable to such strange and fatal eccentricities, we feel that this quality is absolutely essential to our wellbeing. So necessary did some physicians consider it towards effecting a cure, that they held an opinion that both physician and patient should have faith in the prescribed remedy, to insure its success. However questionable this assertion may be deemed, the necessity of finding some one to sympathise with our feelings is felt in all the concerns of life, from the most important event, to the most trifling amusement. The being cut off from this is perhaps what renders solitary confinement the most unendurable of punishments. It is remarkable how those who are deprived of their accustomed intercourse with their fellow-creatures, will endeavour to substitute something to satisfy their craving for sympathy: they learn to treat one of the lower creatures as a friend who can participate in their feelings. Many have opened their hearts to the winds and the woods. We knew a foreigner who did not understand English when first he arrived here, and could meet with no one who understood his native language; he afterwards described most vividly the uneasy state of his mind, which only found relief when he addressed the trees in his own language; and he would stay among them discoursing to them for hours together. The case of Phebe Hasell is remarkable: she was for years disguised as a common soldier; but she felt such a forcible impulse to repose a confidence, that she imparted her secret to a hole which she dug in the ground. When Sir Joshua Reynolds had nearly lost his sight, he made a pet of a little bird; and when apart from society, and no longer able to occupy himself with his painting, he would walk about his apartment with his little companion perched upon his hand, to whom he chatted as if it could understand all that he said.

In this hurried view of sympathy, we have felt more than once that, were we inclined to speculate upon a subject beyond our reach, we might indulge in the anticipation of the more vivid development of this wonderful characteristic, as being a probable means of increased happiness and delight.

POEMS BY A MECHANIC.*

It is in our day no special wonder to find men devoting the moments they can snatch from the daily routine of manual labour to intellectual studies or enjoyments. But instances of this kind are not yet so common that we can afford to pass them by without notice; and at the present moment we are admonished by the date of a little volume before us that we have neglected one of

* Poems and Songs, Scotch and English. By Alexander Mac-lagan. Edinburgh: Tait.

the most urgent duties of the periodical press. The 'Poems and Songs' that claim our tardy attention are in some instances not merely refined in sentiment, but exhibit throughout an easy elegance of composition which is rarely found in works of the class. In two or three of the pieces there is the strength, rudeness, roughness, nay, vulgarity if you will, which many suppose to be the prevailing characteristic of the mind of a workman; but in the external mechanism even of these there is a delicacy almost amounting to fastidiousness, not always found in the productions of the idle and the educated.

Neither in sentiment nor versification does the following little poem bear any mark of a handicraft employment:—

THE EVIL E'E.

An evil e'e hath look'd on thee,
My pair wee thing, at last;
The licht has left thy glance o' glee,
Thy frame is fading fast.
Wha's frien', wha's face, in this cauld warld
It's e'en richt ill to learn;
But an evil e'e hath look'd on thee,
My bonnie, bonnie bairn!

Your tender bulk I happit warm,
Wi' a' a mither's care,
I thought nae human heart could harm
A thing sae guld an' fair;
An' ye got aye my blessing when
I tolled your bread to earn;
But an evil e'e hath look'd on thee,
My bonnie, bonnie bairn!

The bloom upon thy bonnie face,
The sunlight o' thy smiles—
How glad they made ilk eerie place,
How short the langsome miles!
For sin' I left my minnie's cot,
Beside the Brig o' Earn,
Oh ours has been a chequered lot,
My bonnie, bonnie bairn!

I can forgie my mither's pride,
Wha drave me frae my hame;
I can forgie my sister's spite—
Her heart maun bear its blame;
I can forgie my brither's hard
And haughty heart o' ain,
But no the e'e that withers thee,
My bonnie, bonnie bairn!

I ken that deep in ae black breast
Lies hate to thee and me;
I ken wha bribed the fiends that press't
Thy father to the sea:
But hush!—he'll soon be back again.
Wi' faithfu' heart, I learn,
To drive frae thee the evil e'e,
My bonnie, bonnie bairn!

We can afford only one other specimen; but we think it enough in itself to justify the praise we have bestowed upon this small unpretending volume.

I KEN A FAIR WEE FLOWER.

I ken a fair wee flower that blooms
Far doon in yon deep dell;
I ken its hame, its bonny hame,
But where, troth I'll no tell:
When rings the shepherd's e'en'ing horn,
Oft finds that soothing hour
Stars in the sky, dew on the earth,
And me beside my Flower.

It is not from the tints o' day
My gentle Flower receives
Its fairest hue, nor does the sun
Call forth its blushing leaves:
In secrecy it blooms, where Love
Delights to strew his bower,
Where many an unseen spirit smiles
Upon my happy Flower.

Ah! weel ye guess that Fancy gives
This living gem o' mine
A female form, a' loveliness,
A soul in't a' divine—
A glorious e'e that rows beneath
A fringe o' midnight hue;
Twa yielding lips wi' Love's ain sweets
Aye melting kindly through!

'Tis a' the wealth that I am worth,
'Tis a' my praise and pride,
And fast the hours flee over me
When wooing by its side;
Or looking on its bonny breast,
So innocently fair,
To see the purity and peace,
And love that's growing there.

Wi' saftest words I woo my Flower;
But wi' a stronger arm
I shield each gentle opening bud
Frae every ruthless harm.
The wretch that would wi' serpent wile
Betray my Flower so fair,
May he live without a cheering friend,
And die without a prayer!

A VOICE FROM LOUISIANA.

In the course of our literary labours, now extending over a period of sixteen years, it has ever been our object to avoid as far as possible all speculative matters on which large sections of people differ; and that not only as respects our own country, but other quarters into which our sheets may happen to travel. Some persons may think it was wrong to make this compromise, as it might be termed; but entertaining a strong opinion as to its necessity for insuring success in our peculiar course, it was made, and the engagement has ever been carefully adhered to. One consequence of this forbearance has been the diffusion of our publications very far beyond the limits of Scotland or England. In North America, and more particularly since the lowering of the import duty on books to ten per cent. *ad valorem*, the circulation of the works in question has been very considerable. From Boston, Massachusetts, many thousands of our cheap sheets and volumes are now disseminated, as from a centre, over the northern portion of the Union and Canada. Latterly, they have found their way into Louisiana and other southern states. There, however, for the first time, are they now stopped, and their local distributors so terrified, as to be obliged to withdraw a portion of them from circulation. Henceforth our winged sheets, like birds of ill omen, are to be caged at New Orleans: it is not likely that they will in future get even that distance, but be shot down in the attempt to cross the Carolinas. This curious fact has reached us through the American papers, and calls to be explained to our readers as something beyond a joke.

Avoiding, as has been said, topics on which there exists a marked and natural difference of sentiment, we have never considered that the principle that *every man has an inherent and indefeasible property in himself*, ought to be approached with the same reluctance. Slavery in all its forms, without regard to colour of skin, we have not hesitated on all proper occasions to describe as a heinous transgression of the law of God, and a trampling upon the rights of man. This it is which, in connection with our publications, has provoked the hostility of the south. A truth universally acknowledged by the humane and rational to be altogether beyond controversy, is nevertheless controversial in certain parts of America; or, more correctly speaking, is esteemed so dangerous, as to be entirely excluded from discussion. The article immediately concerned in causing the commotion now referred to, is an account of Slavery in America, forming the twenty-seventh number of 'Chambers's Miscellany of Useful and Entertaining Tracts,' a work lately completed in twenty volumes, which, independently of this unfortunate brochure, has been

favourably received and spoken of by the reading world beyond the Atlantic. The account, which was drawn up with much care from the writings of respectable travellers, and which embodies no violent sentiment—being, in fact, what would be termed by many too moderate a view of American slavery and its consequences—is amusingly enough ascribed to the 'Abolitionists,' and is said to abound in falsehoods, although where or what these are, it has not been found convenient to mention. To those who are in the habit of looking upon slavery as a thing for which no honest man could offer one syllable of excuse, the following extracts from 'Le Courier de la Louisiane' (May 19 and 22), a newspaper published in French and English at New Orleans, and purporting to be the 'official paper of the United States, state of Louisiana, first municipality,' will probably be read with some degree of surprise:—

'LOOK OUT, CITIZENS OF THE SOUTH.'

'The Abolitionists have a variety of ways and means for circulating their doctrines, even down here in this remote part of the Union. They have book-hawkers at work, who go from door to door offering literary works for sale with titles from which no one would suspect that the works themselves are tinctured with negro principles. We have seen a work in several volumes, beautifully printed and bound, which has been extensively spread over the Southern States in the mode we have indicated; and yet a considerable portion of one of the volumes is occupied with the grossest falsehoods and misrepresentations respecting negro slavery in the South. Not only have the publishers resorted to false accounts of the manner in which our slaves are treated, but they have got up engravings in the book, conveying notions of the life led by our slaves, of the most repulsive and falsest nature.

'This work, so far from deserving the patronage of southern people, ought to be kicked into mud holes, or sent to kindle fires under the sugar kettles.

'In order that every one may know this work when it comes in his way, we give the title at full length: "Chambers's Miscellany of Useful and Entertaining Tracts," republished at Boston. It comprises several volumes, as we observed above, and is handsomely printed and bound: *hunc tu caveto—hic niger est.*'

'CHAMBERS'S MISCELLANY.'

'On Friday last we noticed the sale of this book in the South, and cautioned our fellow-citizens against it, as containing an article relative to "Slavery in America" most unjust and injurious to the Southern States. This article is in the third volume of the work, and it deserves the character which we gave it. It is indeed a revolting, distorted, and false picture of the treatment to which slaves, as well as free people of colour, are subjected in this country; and under the impression, as we were, that it was hawked from door to door for sale, we were quite right in speaking of it as we did. But we feel great satisfaction in stating that Mr Josiah Adams, the agent for the Boston publishers, called upon us and stated that as soon as he discovered the obnoxious article to which we alluded, he stopped the circulation of the book, and deposited in a box all the copies he had on hand with the intention of returning them to the publishers. He also stated that he went to the few persons who purchased the work, and asked permission to cut out that part of it which had given offence. Mr Josiah Adams is a worthy, high-minded gentleman, who abhors the doctrines and practices of the Abolitionists, and would undergo any loss of property, or sustain any privation, rather than be instrumental in promoting their views. He informs us also that the Boston publishers are far from being tinctured with Abolition principles. In correcting the impression which our notice of this work may have made upon the public mind, we conceive that we are doing an act which is due to one who is perfectly innocent of all

intention to become a tool of the Abolition gang, and who in reality holds them in as much odium as we ourselves do!'

All this is very bad, but in its very badness there is a drollery. How we pity, and yet cannot help laughing at, poor Josiah Adams! Frightened out of his senses at having sold a book 'tinctured with negro principles,' like a judicious bibliopole, he hurries away to the purchasers of the volume, and begs they will permit him to cut out the obnoxious article! Then how thankful he is to thrust the whole mass of delinquency into a chest under lock and key! And lastly, how he posts off to explain everything to the editor of the 'Courier,' and beseech his mightiness to set him right in the eyes of the Louisianian world! He abhors the doctrines of the Abolitionists; would scorn to be a tool of the gang; would undergo any loss of property, or sustain any privation, rather than be instrumental in promoting their views! Good Josiah Adams; slavery-tolerating, freedom-hating, innocent, kind, dear Josiah Adams, we hope that your explanations have been indulgently received by a discerning public; and that under that paragon of constitutions in which all men are declared to be 'born equal,' you have been neither whipped, nor tar-and-feathered, nor hooted out of society, but are going on selling books as usual, happy to have got rid of what threatened to bring you within an inch of destruction!

Talk of a censorship of the press! Has any of the old European governments ever been more unscrupulous in suppressing what was displeasing to it in literature, than the press of Louisiana has been on the present occasion? Talk of the obnoxious article containing falsehoods! Does it embrace anything more severe than the following advertisement, which occurs in the newspaper that attacks it?

'SUCCESSION OF JOSEPHINE FRANKLINE ELEYTAS, DECEASED.'

'Second District Court of New Orleans.—By virtue of, and in obedience to, an order of sale, dated May 19, 1848, and to me directed by the Honourable the Second District Court of New Orleans, in the above-entitled matter, I will proceed to sell at public auction, in the Rotunda of the City Exchange, St Louis Street, between Chartres and Royal Streets, on Friday, June 23, 1848, at twelve o'clock, A.M., for account of said succession, the following named slaves, viz:—

'Susan, aged about twenty-five years, with her two children, named Joseph, aged about three years, and an infant girl aged six months.

'And Ann, aged about twenty-six years, with her three children, named Mary, aged upwards of ten years; Susan, aged about five years; and an infant girl aged about sixteen months.

'Terms.—For the slave Ann and her children, cash; and for the slave Susan and her children, one year's credit, for approved endorsed notes, secured by mortgage on said slaves until final payment.

JOHN L. LEWIS,
Sheriff of the Parish of Orleans.'

To ourselves, commercially and otherwise, the denunciations of the Louisianian press are matter of extreme indifference. Writing for no party, and with a boundless reliance on the efficacy of TRUTH, JUSTICE, and MERCY, we do not fear being able to find an audience sufficiently wide for all our reasonable desires.

USE OF THE HOUSE-FLY IN TEACHING.

An entomologist of high reputation sends us a brief commentary on a passage in 'Hints to School Trainers,' of the Glasgow Normal Training Seminary, written by Mr Stow, its intelligent director. 'I was glad,' says our friend, 'to observe so striking an instance of the superiority of Mr Stow's plan of training over that of merely teaching, in imparting to a child a thorough knowledge of the subject brought before him, because it so strongly confirms the

opinions I have long held as to the best way of teaching natural history in schools. I have often said that if I were a schoolmaster, my first lecture to the boys should be on the common house-fly, and my exordium, "Now, boys, all of you run up that wall, and perch yourselves on the ceiling, backs downwards, and stay there till I tell you to come down." This, besides rousing their attention, would of course excite a laugh, and then would come the question, "But why can't you run up a wall as well as a fly can, and, like it, remain on the ceiling?" Some sharp lad (if allowed, as they ought to be, to interrupt the lecture every minute with their queries) would probably answer, "Because flies are much lighter than boys;" and then would follow proofs by actual experiment, that bodies much lighter than flies cannot remain against a wall, or on a ceiling, because prevented by the laws of gravitation (which should be very generally explained if they had not been before), unless counteracted by some vital power of adhesion; and an explanation, by means of a microscope, of the various theories proposed for solving this difficult and not yet thoroughly-understood problem, concluding this part of the lecture by referring to this as a striking instance what marvels yet remain unexplained in the economy of the commonest insects, and of the beautiful provisions of the Father of all for their wellbeing and enjoyment. You will perceive that this very small fraction of the history of the house-fly, thus treated on the Glasgow plan of "training" the pupil to see all the difficulties of the question, and helping him to solve them, would occupy a full hour or more; but how infinitely more solid and extensive would be the knowledge thus imparted! In fact the common house-fly, on this plan, might be made the peg on which to hang the whole outline of entomological science, and far more effectually than by any dry regular abstract, such as is usually given.

SMOKING.

The following observations on the use of tobacco are from an Ipswich temperance tract:—"Dost thou smoke, Bill?" said a tall, lean, sickly-looking youth to a fine, robust, healthy-looking lad the other day, as they passed me in the street; while at the same time a cloud of tobacco smoke came directly in my face, which made me wish most heartily that Bill did not smoke. I need not say how glad I was to hear the rosy-looking lad say, 'No, I don't.' Just as this conversation took place, two dashing young men passed me smoking cigars, the one about seventeen, the other about eighteen years of age. Turning my footsteps homeward, I could not help pondering on this almost universal practice of smoking, pursued alike by old and young, and ever and anon some of the faces of my neighbours and acquaintances would present themselves to my recollection, and never was I more surprised to find, on reflection, how closely were linked together great smokers and poverty—great smokers and pallid looks—great smokers and want of cleanliness. I took down my cyclopædia, and looked for the word 'tobacco.' 'Tobacco,' says the compiler of the book, 'contains an oil of a poisonous quality, which is used in some countries to destroy snakes, by putting a little on the tongue; on receiving it, the snake is seized with convulsions, coils itself up, and dies; and what is very singular, becomes almost as stiff and hard as if it was dried in the sun.' 'I have been,' says a very eminent medical writer, 'now twenty-three years in extensive practice, and I never observed so many pallid faces and so many marks of declining health, nor have ever known so many hectic habits and consumptive affections as of late years; and I trace this alarming inroad on young constitutions principally to the pernicious system of smoking cigars. I am entirely convinced that smoking and chewing tobacco injure ultimately the hearing, smell, taste, and teeth. The practice of smoking is productive of indolence; it opens the pores of the head, throat, neck, and chest, and then going into the cold, your pores are suddenly closed—hence arise disorders of the head, throat, and lungs.' Mr Curtis, in his observations on health, says, 'The excessive use of tobacco, in whatever shape it is taken, heats the blood, hurts digestion, wastes the fluids, and relaxes the nerves. A patient of mine, who used to boast of the number of cigars he could smoke in a day, produced pythias or salivation by his folly; and had he not abandoned the practice, he would have lived but a very short time.' Snuff is highly injurious to apoplectic persons, and those labouring under deafness and other diseases of the head—to the consumptive—to those afflicted with internal ulcers,

or subject to spitting of blood. It is an uncleanly habit: it vitiates the organ of smell; taints the breath; weakens the sight, by withdrawing the humours from the eyes; impairs the sense of hearing; renders breathing difficult; depraves the appetite; and, if taken in abundance, gets into the stomach, and injures in a high degree the organs of digestion.

'BOILING DOWN' IN AUSTRALIA.

In addition to the demand for colonial consumption, and for salting, a new market for the surplus stock has been found within the last few years, by the discovery of the process of 'boiling down,' or converting the whole carcase into tallow. He who first put this plan into operation deserved the thanks of all the colonists; for had not this method, or some equivalent to it, been invented, cattle and sheep must soon have become almost unsealable, as the supply had so greatly exceeded the demand, whereas now, though the colonial market should be overstocked, the animal, whether sheep or ox, is at least worth its hide and tallow for exportation. 'Boiling down' is a very simple and rapid process. The whole carcase, having been cut up into pieces, and thrown into large cast-iron pans, each capable of containing several bullocks, is boiled to rags, during which operation the fat is skimmed off, until no more rises to the surface. The boiled meat is then taken out of the pans, and after having been squeezed in a wooden press, which forces out the remaining particles of tallow, it is either thrown away, or used as food for pigs, vast numbers of which are sometimes kept in this manner in the neighbourhood of a boiling establishment. The proprietors of these places will either boil down the settler's sheep and cattle at so much per head, or purchase them wholly from him in the first instance, and convert them into tallow at their own risk. The value of an animal for this purpose depends of course entirely on his condition, and usually varies from 30s. to £3, 10s.—*Bush Life in Australia.*

SAVING OF FUEL IN GAS-WORKS.

At the last meeting of the Royal Scottish Society of Arts, Mr W. Kemp stated that he had made a valuable discovery in economising fuel at Galashiels gas-works. Where coal-tar is burned, it has an injurious effect on the furnace bars and retorts, the greatest annoyance arising from the rapid clinking up of the furnace bars, to remove which the firemen had frequently to throw water into the furnace, which caused the rapid destruction of the bars. To prevent this, the idea occurred to Mr Kemp of using the exhausted tan-bark of the tan-works, which had the desired effect. The force-pump for injecting the tar into the furnace was next thrown aside, as it was found that the dry bark absorbed tar equal to its production at the works. His method is as follows:—The bark is dried, and mixed with the coke of the gas-coal, bulk for bulk; a paulful of tar is thrown upon it, not quite so much as it will absorb, and it is then turned over. The mixture burns with a fine clear flame, attended with less smoke than formerly; the furnace bars, by remaining unclinkered, admit the oxygen freely for the combustion of the fuel. Where tan-bark cannot be had, peat moss, loose and dry, makes a good substitute. Mr Kemp stated that in one year £126 was saved in furnace coal.—*Pharmaceutical Times.*

THE FRENCH REVOLUTIONS.

W. AND R. CHAMBERS respectfully announce that a HISTORY OF THE FRENCH REVOLUTIONS, which has been preparing for them during the last two years, is at length put to press, and will forthwith appear. Originally, it was intended to confine the work to a history of the deeply-interesting period from 1789 till the fall of Napoleon in 1815; but recent events have rendered it desirable to extend the narrative to 1848; and therefore, besides an account of the First Revolution, the Consulate, the Empire, the Restoration, the Revolution of 1830, and the Reign of Louis-Philippe, it will include an ample notice of the late exciting scenes—the whole drawn from original sources, and presented in a comprehensive and popular form. The work, to consist of Three Volumes post 8vo., will be issued in portions convenient for purchasers.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. S. ORR, 147 Strand, London; and J. McGLASHAN, 21 O'Flower Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 239. NEW SERIES.

SATURDAY, JULY 29, 1848.

PRICE 1½d.

PROGRESSIVENESS.

We once heard an esteemed friend declare that if anything more than another had enabled him to present a respectable front to society, it was his being always in a progressive state. He had never been at a stand-still in his course of life; much less had he ever gone back. He had been, on the contrary, so constantly moving onward, that no year found him precisely the same in any kind of attainments, those of fortune included, that he had been in another. Thus the principle of hope was ever kept alive within him, making all present sacrifices light, and all immediate indulgences indifferent. He was never in danger of being too easily satisfied with himself or other things: he had been kept active and cheerful all along. In fact, progressiveness had produced in him all the difference that there is between the stagnant pool and the lake having an outlet; it had been the prime element of his moral health.

There should be nothing surprising in this. All that we see of nature displays the principle of Progress—from the formation of a planet, to the development of a flower. Our physical being, from the cradle upward, is evermore a progress; it is a progress which we hope for in the life beyond life. It is only, then, to be expected that progress, as regards the *morale* of the individual, being in accordance with this great law of nature, should involve in it some powerful virtue or efficacy for good. Yet it is somewhat strange that you may read a whole library of treatises on human nature, without finding a word on this subject.

The same rule presides over the histories of nations. We turn with pity from the stereotyped nations of the East, to contemplate the progressive states of the West. We view with the same relative feelings the slow-moving England of the fifteenth, and the rapid-moving England of the nineteenth centuries. Take the liveliest people on earth, and place them under the cold shade of such a rule as that of Austria lately was, by which progress is forbidden—their spirit dies within them, and for ages there is nothing but commonplace life, fulfilling merely the conditions of rising, eating, and sleeping. Restore this people to a progressive system, and their energies quickly come to very different results. We are accustomed to regard the decline of the Roman Empire as a consequence of the dissolution of all the virtues which had marked the period of the Republic; but whence this dissolution of virtues? May it not have proceeded very much from the cessation of progress in the Roman greatness? They had conquered all that was within reach. The salutary strain on the national faculties under which this had been done, was consequently relaxed. Having no longer anything to make an effort for, any object for hope, they turned to

seek excitement in indulgence; and hence their lamentable falling off, and final ruin. Much worse hypotheses have ere now, we think, experienced favour.

It might not be difficult to show that in the society which we see around us, the estimable qualities bear some proportion to the temptations which exist, within and without, to progress. We are all familiar with the fact, that a young man with moderate advantages for success in the world, is more likely to prove a good citizen than he who enters on his career with large fortune. In the former case there are all possible external provocatives to progress; in the latter none. If the endowed youth does well, it must be under the rare chance of his having an internal spring of activity which sends him onward in search of higher enjoyments than he starts with. The more general case is, that, having no motive for exertion, he gives his soul to ease and indulgence, makes no progress, and is nobody. Whence the strange alternation of prosperity and goodness in the generations of a family, if it be not from the one being poverty-tempted to progress, the next endowed for idleness and extravagance, and the next, again, set on by indigence to industry and virtue once more? It has been remarked that the greatest virtues reside at some distance from both extremes of society. This may well be. With the born rich progress is out of the question, for they possess all which other men find a virtue in seeking. The excessively poor have no hope of making themselves otherwise, and therefore never attempt progress. But among the middle classes, temptation to progress is the common case. All are struggling to attain some point which they think important to happiness; and they find happiness, and develop virtue, in the effort alone, whatever they may discover in the object when ultimately attained. Amongst these classes, salaried officials are necessarily condemned to less lively hopes of advancement than those who have the entire charge of their own fate. Among the former there is much steady worth and constancy, but the others are the men for demonstrating the active virtues. The independent commercial man who has come to a stand-still will be found, too, a very different man from the one who, though absolutely less wealthy, is going on in a constant progress.

One grand cause of the unsatisfactory state of the labouring classes in this country is their being so little progressive. The contrast between a poor shopkeeper, making every minute of his time, and every saving he can effect, tell on his permanent prosperity, and an artisan, of equal power of gain, idling and dissipating all above a certain amount of working time and a certain amount of earnings, is extremely striking. The one seems to be under a magnetic attraction towards prosperity and an attendant decency; the other under a repulsion with respect to the same things—a repulsion

which only a select portion of the class can overcome. Yet the labouring classes have nearly, if not fully, as good means and opportunities of advancement as the middle classes, if they only would allow themselves to see it. Many do indeed advance, and thus prove the truth of the rule as applicable to all. It is a false class opinion or feeling which seems to be mainly instrumental in keeping them down—something very much equivalent to the Irishman's cry, 'I will fall, and nobody shall help me.' They think themselves kept down by the other classes, and therefore remain down. Antipathetic to those other classes, and thus forbidding themselves the just ambition of rising to be of them; ever banding among themselves, and thus necessitating a sort of equality of condition, they may be said, as a body, to have taken a stand-still position. What is required to give them the same chance with the other portions of the industrious multitude is something very different from combination—it is competition, as to which among them, by the greatest exertion and skill, shall merit the greatest rewards, and by his foresight and self-denial, shall live not merely the most decent, but the most *elegant* life. They must consent to be severally progressive, as the middle classes are. They must learn to be not too easily content, and to look beyond the passing day. If the trading people had no idea beyond living from hand to mouth, coming into family cares in early youth, and struggling on through life in mean homes, without any taste of comforts, they would quickly get into as unsatisfactory a state. But they choose to be progressive instead; and hence the difference of their condition.

It would be well for every one who has the least influence over the fate of a fellow-creature to seek to make him, as far as possible, a progressive being. There is no person to whom the principle is denied in some form or other. If the young man of fortune has no need to struggle, as his father perhaps did, for wealth, let him set up some other good ambition before him—agricultural improvement, if he possesses land; in other cases, the dignities of the commercial world or of general society. If the successful poet has exhausted worlds, let him imagine new. Let everybody have something to strain towards, something to make him progressive. It is the true way to happiness, because it is the source of nearly all goodness.

THE UNDERCLIFF, ISLE OF WIGHT.

THE coast of the Isle of Wight has been celebrated from an early period for the beauty of its scenery, and it is now as regularly visited by a crowd of summer tourists as the Lakes, the vales of Derbyshire, or any other of the show-places in England. One portion of it, the Undercliff, has of late years obtained celebrity on another ground—the excellence of its winter climate; and during the inclement season of the year, it becomes the residence of a large number of persons who, being sufferers from weak health, desire to procure the mildest atmosphere which can be obtained without quitting England. With Torquay, Hastings, and one or two other places, it shares the reputation of affording invalids a more suitable air, and a higher temperature, than can be found out of these favoured spots; and a stationary colony, of no less than from one to two thousand persons, settle in it about the beginning of November, and remain there until the end of April.

The Undercliff is situated on the south coast, over against France; or, as it is locally called, the back of the island. Geologists tell us that the Isle of Wight was at one time joined to the mainland, and they arrive at this conclusion from an examination of the strata, which are found to be continued and connected on each side of the present line of division. However that may be, it is certain that there is now a broad arm of salt water between the two, one branch of which is named the Solent, and part Spithead. If we cross this channel by one of the Southampton steamers to Cowes, and

drive through the middle of the island to the opposite coast, we shall find ourselves, after getting over much inclined ground, at an opening between the downs, and standing at a considerable height above the sea. The downs, through a depression in which we are about to descend, form here a line five or six miles in length, and seem like a huge embankment thrown up to prevent the encroaching of the ocean. Before placing our foot on the 'yellow sand,' however, a narrow strip of land is seen to intervene, several hundred feet below, and this is the Undercliff. Having obtained access to it by a steep winding road, we stand upon a piece of ground exhibiting great irregularity of surface, varying in width from the third of a mile to a mile, and having a length corresponding of course with that of the range of downs above. It is raised, like a terrace, fifty or a hundred feet above the sea, with a bare and abrupt face in that direction, but carpeted with grass to the very edge. Though I have likened this strip of land to a terrace, it must not be supposed that for its entire length it is on a uniform level, and in a straight line, like a garden walk. Far from that: it is continually moulded into rounded breasts, which are separated by broad channels, and have been partly demolished by the attacks of winds and waves. At spots it is subdivided into crescent and bow-shaped terraces, with an aspect towards the sea. Now and then it pushes forward promontories, like the angles of an external fortification, and headlands are tilted upwards, like the necks of rearing horses—a simile not unnatural or exaggerated to those who have seen the spot; for I have always been reminded, when I have stood in those positions from which I was able to look along a file of headlands, of the horses represented on the friezes of ancient temples, as thrown into various attitudes by the excitement of the moment. At some places the terrace wall has been broken through, and by most of the openings the margin of the water may be reached, down an easy slope called a cove.

Now if we take our stand upon the point of a battlement (following up the idea of a terrace), we look, on one hand, upon the open sea sending its rollers to the base; on the other, and at a short distance upon the downs over which we were brought, to the Undercliff. We perceive that the face of the latter is in some places covered with a fine short herbage, scarred here and there by the elements, and showing the light-coloured earth beneath; in others, supported by long buttresses of sandstone, the front of which, under the action of the weather, has been worn into horizontal and parallel grooves, imitating the courses of stone in a wall. A narrow path runs along the edge of this upper tier of cliffs, and commands charming views of the country beneath, the whole of which is nothing more than gigantic landlips, the ruins of rocks fallen from above, and covered again with vegetable mould. The natural order of the strata has in many places been completely reversed, and the greatest confusion prevails amongst the dislodged masses. It is curious to observe the natural tendency of the earths, forming the cretaceous group of deposits, to mould themselves into outlines of a graceful flow. A spot which, at a comparatively recent period, was but a rude heap of débris, presents to the eye, under a thin coating of earth, the most beautiful curves, that softly swell into knolls and heights of various height and position. Looking down from an elevated station, such as the cliff path, the ground seems padded underneath with some soft substance. The last extensive landlip took place in 1799, when hundreds of acres were strewn with wreck. The cliff still continues to give way here and there, discharging every winter splinters of a few tons into the fields below.

The interval between the downs and the sea is characterised by a curious inequality of surface; and it is surprising to find, within limits so narrow, such a number of walks, and such a variety of scene. Most persons will still give the preference, in point of beauty, to Bonchurch, notwithstanding that the number of new

buildings has much injured the simplicity and retirement of the little village, though it must be admitted that most of the houses are in good taste. Dr Arnold declared Bonchurch to be the most beautiful thing he had ever seen on the sea-coast on this side of Genoa. On the whole, the country cannot be called woody, though here and there the trees are numerous, particularly towards the east end, where the foliage in summer must delightfully enhance the charms of the scenery. It may, however, be remarked, that the scenery is of a kind which is less than usually dependent for its effect upon the season's change; and the quantity of the ivy helps to conceal the bareness of the trees in the winter months. I do not know that the trees flourish with a richer sap than elsewhere, but with the luxuriance of the ivy I have been much astonished. The creeper is found enveloping every wall and rock, and most of the tree trunks, to such a degree that, as I hinted before, the wild work done by the winds of autumn to the deciduous foliage is on a bright sunny day little noticed. The rocky buttresses under the down are most beautifully festooned with the evergreen; it crawls over them like a vine, and bushes off into thick tops, that must form admirable winter retreats for invalid owls, if any such there be. In the coppices it is seen creeping along the ground amongst the grass, and there are whole acres entirely covered by it.

The Undercliff may be reached from the south by three depressions in the downs, and from the east and west by roads which pass over high shoulders. The downs swell into high heads at the points of widest separation: St Boniface Hill, on the east, rises to the height of three hundred feet, commanding a fine view of Sandown Bay and the centre of the island; St Catherine's Hill, on the west, is about a hundred feet higher, and forms the most favourable *point de vue* in the whole island. The noble bay, terminated by fresh-water chalk cliffs, and those singularly-insulated rocks the Needles, stretches away from beneath the spectator's feet. The sea may be perceived at intervals on all sides, so that it is evident he stands upon an island; a very long line of mainland coast is visible from Beachy Head to the Isle of Portland; and beyond, the eye rests upon a great number of objects, the most conspicuous of which are the Sussex Downs and the New Forest. On a very clear day, it is said that even the French coast near Cherbourg can be seen. The ridge is crowned with an old octangular tower—the only remains of a chantry, founded here as early as 1323, and dedicated to St Catherine, whence the hill acquires its name. The builder directed that a priest should perform mass in it, and provide lights during the night for the guidance of vessels approaching this dangerous coast. It appears from old records that a hermitage occupied the spot before the chantry. What an appropriate situation for him who sought to combine a life of solitary meditation with an observance of nature!

'Where he might sit and rightly spell
Of every star that heaven doth show!'

Close by is the shell of a lighthouse, now suffered to go to ruin since the erection of a more modern building on the shore. It was found that mists so frequently obscured the hill, that a lighthouse placed there was nearly useless, being hid from view at the very time when it was most wanted. The tops of these downs produce furze and heather in abundance. There is also a good deal of decayed vegetable matter, forming thin layers of peaty earth, amongst which there are scurvy eruptions of flints, similar to the beds of stones we see on northern fells.

Let us now quit these windy heights, whither the invalid seldom ventures, for the clement district at their feet. Ventnor, the capital of the Undercliff, consisted a few years ago of not more than a dozen cottages. It has now become a town of five or six hundred permanent inhabitants, possessing a church, a post-office, a

paving act, shops, coaches, and circulating libraries! A friend of mine who visited the place nine years ago, informs me that there was then only one butcher there, and that considerable diplomacy was requisite to secure a whole joint of meat. There are now four dealers in that article of food, and other tradespeople have increased in a like proportion. This sudden increase in the size of Ventnor, which seems to rival the progress of a town in the new continent, may be attributed to her Majesty's physician, Sir James Clark, who, in his work on the sanative influence of climate, pointedly called the attention of medical men and invalids to the Undercliff as a winter residence for those afflicted by throat or chest complaints. In that work he gives minute tables of the temperature, and of the fall of rain, and he declares that a more suitable climate for the majority of bronchial and pulmonary diseases cannot be found in Great Britain, being remarkably equable, as well as mild and dry.

To speak from my own experience, however (the experience, it must be remembered, of one person during one season), I should say that the climate scarcely deserves this encomium, to its full extent at least. The months in which I found it really superior are November and December. Many days occurred then such as I never saw excelled in beauty at the same period of the year in any other place. The three following months, however, were marked by much moisture. The wind blew with great violence from the south-west, almost invariably bringing rain; and when the wind intermitted, dense fogs enveloped everything, so that we seemed to be living for several days together under a ground-glass shade. The chief advantage of the Undercliff no doubt consists in its higher temperature, there being a difference of some degrees in the coldest weather between its climate and that of the most sheltered part of the country to the north. This is partly owing to the protection from northerly winds, previously referred to, as afforded by the lofty embankment of down, and partly to the reflection of the sun's rays from that screen upon the terrace beneath. This, on a sunny day, causes a wonderful elevation of the temperature in a short space of time; and the early appearance of wild flowers in the fields and woods testifies its fecundating influence on the earth.

Although Ventnor is now tolerably well supplied with shops, it is still wanting in many things which other watering-places consider essentials—good promenades, facilities for making excursions, amusements, and so forth. It is a little unfortunate that there are no sands laid bare at low tide in any part of the Undercliff; and one soon gets tired of slipping up to the ankles in shingle, or breaking one's shins on the weedy rocks. A little knowledge of botany and geology will afford visitors some pleasurable employment. On the latter subject they will do well to consult Dr Mantell's interesting publication.* It will be sufficient here to state, that in this part of the Isle of Wight the cretaceous group of deposits may be studied to advantage. The downs are capped with chalk containing nodules of flints; and then comes a stratum of argillaceous chalk called marl, rich with fossils. This is intersected by the roads which leave the Undercliff for the upper country, and the hammer will easily bring out at these spots a variety of organic remains—ammonites, nautilus, scaphites, &c. Next, beneath this white marl, lie a series of sandstone beds, alternating with thin beds of chert and limestone. The latter, being of a firmer structure than the sandstone, resists the weather better, and hence arises the horizontal grooving before noticed. This group has been termed, collectively, the *upper green sand*, or, as Dr Mantell proposes to call it, *firestone*. A very pretty building

* Geological Excursions round the Isle of Wight, and along the Adjacent Coast of Dorsetshire, Illustrative of the most interesting Geological Phenomena and Organic Remains. By G. A. Mantell, LL.D., F.R.S. 1847.

stone is obtained from it, which has been universally used throughout the Undercliff. It contains numerous fossils, and a good deal of silicate iron, which communicates to newly-quarried blocks a green tinge on exposure to the air. The long line of cliff extending from Ventnor to St Catherine's Down consists of upper green sand strata. Underneath the sandstone is a bed of dark-blue clay, locally called *blue slippery*, but known to geologists by the name of *galt*. It is only now and then exposed to view; it holds peculiar species of ammonites and nautili, with other fossils. Wherever, by the fall and displacement of masses of strata, this clay is exposed to atmospheric action along the shore, it gives way, and the superincumbent earth losing its support, is carried down to the shingle. In this manner large quantities of valuable soil are totally lost to the owner, and the propriety of the local name is evident. The lower green sand lies below the *galt* in alternating argillaceous and arenaceous beds, measuring altogether more than a thousand feet in thickness. It is very rich in organic remains, but within the limits of the Undercliff it can only be seen in fragments. To see the beds *in situ*, the shore on each side must be visited.

And this leads me to speak of the Chines, a kind of ravine in the lower green-sand deposits, which is well known to all tourists in the island. The lofty sandstone cliffs which wall off the sea have been broken through at some places by a force which appears to have been very great, and suddenly applied. A split or chasm has been the result, which extends through the wall, narrowing as it leaves the shore, and generally terminating in a broad hollow orcombe on the higher down. Such a gap is termed a *chine*;^{*} it is usually lined with rocks sprinkled with trees, and along the bottom of the groove a little short-lived stream rushes to join the sea. It will be readily conceived that the Chines abound with highly picturesque scenery; and that, viewed from every point—from the sea, from the brink of the ravine, or from the down—they present a peculiar and interesting feature in the landscape. Luccombe and Shanklin Chines are to the east, Blackgang Chine to the west of the Undercliff district. All of them may be easily visited on foot from Ventnor by persons of ordinary corporeal strength; but properly to see the last-named one, it must be remembered that a boat will be required, which may be procured at the inn near at hand. This Chine is wild and bare, very different from the other two: a little runnel of water falls over a sombre cliff; and when the spectator pushes out far enough to draw St Catherine's Down into the picture, the effect of such a back-ground, seen in perspective through the rent, is magnificent. It will probably occur to the reader that Shanklin Chine, the most beautiful of the three, was described by Mr Leigh Richmond in one of his popular Tracts. There is a remarkable scientific phenomenon connected with the down above Shanklin. In the progress of the ordnance survey which has been extended over England, a deviation of the plumb-line from its perpendicular was observed to take place in the neighbourhood of this down. In Sir Roderick Murchison's address to a meeting of the British Association, he remarked that it was a surprising fact that this comparatively low chalk range should possess a power of attraction more than half as great as the dense and lofty mountain of Schehallien in the Scottish Highlands, the influence of which on other bodies was noticed by Dr Maskelyne, in 1774, whilst making his astronomical observations.

The streams that break out of the sand rock in the Undercliff are remarkable for their extreme clearness; one of the springs was dedicated in old time to St Lau-

rence, whose name it still bears. It bursts out close by the roadside, and is received into an arched canopy of modern workmanship. On the top of one of the downs there is a spring called the Wishing Well, from a popular tradition that the mental wishes of persons who perform certain ceremonies at its side will be gratified—a power like that possessed by the Gramere Wishing-Gate, which the pen of Wordsworth has immortalised:

'Smile if thou wilt, but not in scorn.'

The chalybeate spring near the western extremity of the Undercliff is possibly more efficacious in bodily ailments, but the reputation of that does not appear to be very high.

The antiquities of the district are not very numerous. The churches of St Laurence and Bonchurch are small, and very ancient structures, which form picturesque additions to the scenery; but they do not afford much scope for the investigations of the antiquary, or much detail for the study of the architect. Not far distant from the former, and near a farmhouse called Woolverton, there are some old walls overrun by ivy, the only remains of an oratory, the origin of which seems to be quite lost; but it makes a pretty sketch in connection with the surrounding landscape, and that sketchers care much more about than a long history of monks and charters. The park and mansion of Appuldurcombe, the seat of the Earl of Yarborough, three miles distant over the down, are objects of great attraction to strangers; and deservedly, for in addition to the beautiful views commanded by the former, the latter contains some valuable Greek and Roman antiques, and a choice collection of paintings by the old masters, most of them of great excellence. The interior of the house is shown on two days of the week to strangers, who have previously procured admission orders from the steward. The antiques and pictures were got together by Sir Richard Worsley, an ancestor of the present owner, who, in 1785 and the two following years, undertook a voyage to Italy, Greece, and the East, for the express purpose of making a collection. He freighted a vessel, and took competent artists with him, to make drawings of various remarkable objects. Pennant derives the strange-looking name from *y pull y dwr y cwm*, words signifying in English, 'The pool of water in the hollow of the hill.'

THE TREASURE.

In the upper apartment of an old-fashioned house in Paris were seated an old man and a young girl, whose appearance corresponded with the aspect of their habitation; for in both were alike visible a certain air of neatness and good taste, which can embellish even poverty itself, and give an air of elegance to the lowliest abode. Everything was in its place; the brick floor was carefully scrubbed; the faded green tapestry was free from every stain; and the windows were furnished with coarse curtains of white muslin, so thickly covered with darns, that it almost bore the appearance of embroidery. A few flower-pots stood outside the open window, and perfumed the room with their fragrance.

The sun was about to set, a purple light illuminated the humble dwelling, glancing on the fresh bright countenance of the young maiden, and playing around the white hairs of the aged man. This latter was reclining in a rush-woven arm-chair, which a careful and loving hand had furnished with cushions, carefully stuffed with tow, and covered with patched chintz. His mutilated limbs rested upon an old *chauffe-pied*,^{*} converted into a stool, and his only remaining arm rested on a small table, on which lay an amber pipe and a tobacco case, embroidered with coloured beads.

The old soldier had one of those bold and furrowed countenances whose roughness is tempered by its frank and kind expression. A gray moustache concealed his

* The derivation of this word has given rise to much speculation; perhaps its origin may be found in the French verb *échiner*, to strike violently, to break. Roads up steep hills or banks are called *shoals*, and it is not unlikely that we may find the origin of this word also in the French *chute*, a fall, a descent. Neither of these local terms have I met with elsewhere in England.

half-parted lips, as he fixed his eye with an unconscious smile upon the young girl. She was about twenty years of age; a brunette, in whose winning and flexible features every passing emotion was portrayed. She held in her hand a newspaper, which she was reading aloud to the old man. Suddenly she stopped, and seemed to listen.

'What do you hear?' inquired the invalid.

'Nothing,' replied the young girl, while her countenance was expressive of disappointment.

'You thought you heard Charles?' inquired the soldier.

'It is true that I fancied so,' replied his young companion, slightly colouring; 'his day's work must be finished, and this is his hour for returning.'

'When he does return,' remarked Vincent in a tone of vexation.

Susan was on the point of seeking to justify her cousin, but her judgment was doubtless opposed to the attempt, for she stopped short, looked embarrassed, and then fell into a reverie.

The invalid soldier passed his hand across his mou-tache, and twisted it impatiently, his usual gesture when anything annoyed him.

'Our young conscript is making a bad campaign of it,' he at length began. 'He returns here out of humour; he leaves his work to frequent taverns and the race-course: all that will end badly both for him and us.'

'Oh do not say so, uncle! You will bring him ill luck,' replied the young girl in a tone of deep emotion. 'I hope it is only a moment of delusion, which will quickly pass away. For some time past, my cousin has got some strange notions into his head, and he has not the heart to work.'

'And why so, pray?'

'Because he says he can't expect to better himself by his labour. He thinks that an artisan, let him work ever so hard, can have nothing to hope for the future, and therefore deems it best to live merely for the present hour, without carefulness, and without hope.'

'Ah! so that is his system, is it?' replied the old man, knitting his brows. 'Well, the honour of inventing it does not belong to him. We had also in our regiment reasoners of that kind, who gladly avoided marching with their comrades because the way was so long, and who dragged on their dull existence in the dépôts, while their companies were taking possession of Madrid, Berlin, and Vienna. Your cousin, you see, does not seem to be aware that by putting one foot before the other, even the shortest legs will get to Rome at last!'

'Ah, if you could only get him to be of that opinion!' exclaimed Susan with anxious earnestness. 'I have often tried to change his mind by reckoning up how much a good bookbinder such as he is might economise; but when I come to the total, he shrugs his shoulders, and says that women understand nothing about calculations.'

'And so I suppose you gave up the matter in despair, my poor child?' said Vincent, looking at her with a smile of mingled sadness and affection. 'I see now why your eyes are so often red'—

'My uncle, I assure you'—

'What makes you so often forget to water your gilly-flowers, or to sing your merry songs'—

'My uncle'—

Susan looked down as if confused, and twisted the corner of the paper. The old soldier laid his hand affectionately on her head—'Come, then; I do believe she thinks I am going to scold her,' he continued in a tone of brusque kindness. 'Isn't it quite natural that you should be interested about Charles, who is now your cousin, and who one day, I hope'—

The young girl made a sudden movement.

'Well, well; no, we won't talk any more about that,' said the veteran, checking himself—'we won't talk any more of that just now. But let us speak a little about this good-for-nothing boy, for whom you feel some

friendship—that is the proper word, I think—and who, on his side, feels kindly towards you.'

Susan shook her head. 'He used to do so in former days,' said she; 'but for some time past, if you knew how cold he seems, how indifferent to me.'

'Yes,' remarked Vincent pensively, 'when one has once partaken of exciting amusements, the pleasures of home appear insipid: it is like drinking home-made wine after cherry brandy; one can understand that, my child; many of us know it by experience.'

'But they have been cured,' observed Susan; 'therefore Charles may be so too. Perhaps your speaking to him, uncle, might do him good.'

The old man shook his head doubtfully. 'Such faults as his are not cured by a few words, my child—acts are necessary. A man can no more be suddenly transformed into a reasonable being, than into a good soldier: he requires exercise, experience, fatigue; he must learn his business at the cannon's mouth. Your cousin, you see, is deficient in will, because he does not see before him any object to be attained. The great thing would be to find one which would stimulate him to persevering industry, but this is no easy matter: however, I will think about it.'

'It is he this time!' exclaimed Susan, who had recognised the hurried steps of her cousin as he ascended the stairs.

'Silence, then,' said the veteran; 'we must not seem to have been talking about him, so go on reading to me.'

Susan obeyed; but the tremulousness of her voice would quickly have betrayed her emotion to the ears of an attentive observer. Whilst her eyes rested on the printed characters before her, and her lips mechanically pronounced the written words, her thoughts were absorbed by her cousin, who had just then entered the room. As the reading continued, the young workman did not feel himself obliged to speak; so, without saluting either his uncle or cousin, he went over to the window, and stood leaning against it with folded arms.

Susan went on reading, without understanding a word she said. She came to that series of unconnected facts which are always to be found under the head of 'Varieties.' Charles, who had at first appeared *distrait*, ended by listening, almost in spite of himself.

The young girl, after reading a list of robberies, fires, and accidents of divers kinds, came to the following article:—'A poor pedler of Besançon, named Peter Lefèvre, resolving to make a fortune at any cost, conceived the idea of setting out for India, which he had heard spoken of as the land of gold and of diamonds. He sold what little he possessed, reached Bordeaux, and embarked as cook's assistant in an American ship. Eighteen years passed away, and no tidings were received of Lefèvre; but now at length his relations have received a letter announcing his approaching return. It informs them that the *ci-devant* pedler, after enduring unheard-of fatigues, and incredible changes of fortune, had arrived in France blind of one eye and short of an arm, but the possessor of riches valued at two millions of francs.'

Charles, who had listened to this article with growing interest, could not suppress an exclamation of surprise—'Two millions!'

'They will serve to buy him a glass eye and a cork leg,' ironically observed the old soldier.

'There is good fortune for you!' continued the young workman, without heeding his uncle's remark.

'And which it cost him a good deal to obtain,' added the veteran.

'Eighteen years of unheard-of fatigues!' repeated Susan, dwelling upon the words of the paper.

'What matter, when a fortune was in view!' replied Charles eagerly. 'The difficulty does not lie either in travelling over a bad road, or in encountering stormy weather to reach a good shelter, but in having to walk on with nothing in prospect at the end of our journey.'

'And so,' continued the young girl, timidly raising her eyes towards her cousin—'so you envy this pedler's

lot. You would give all your youthful years, one of your eyes, one of your hands'—

'For two millions?' interrupted Charles; 'most assuredly. You have only to find me a purchaser, Susan, at this price, and I will engage to give you a portion for pin-money.'

The young girl made no reply, but turned away her head; her heart was heavy, and a tear trembled in her eye. Vincent also was silent; but he had again begun to twist his moustache with a morose air. There was a long silence.

Each of the three actors in this scene was engaged in pursuing a peculiar train of thought. The sound of the clock striking eight aroused Susan from her reverie. She rose hastily, and began to lay the cloth for their evening repast. It was a short and gloomy one. Charles, who had passed the latter part of the afternoon in a tavern with his friends, would eat nothing, and poor Susan had lost her appetite. Vincent alone did honour to the frugal repast; for the hardships of war had accustomed him to *maintain the privileges of his stomach* in the midst of the most trying scenes. But his hunger was quickly appeased, and he returned to his arm-chair near the window. Susan, who longed to feel herself alone, soon put everything back into its place, took a light, kissed the old man, and retired to her little chamber overhead. Vincent and his nephew were left tête-à-tête; and the latter was also preparing to take his leave, when the old soldier made a sign to him to shut the door, and to come nearer to him.

'I want to speak to you,' said he seriously.

Charles, who expected to receive some reproaches for his late conduct, remained standing before the old man, but the latter made him a sign to sit down.

'Have you reflected well on the words which you spoke a few minutes ago?' he inquired, looking fixedly at his nephew. 'Would you really be capable of making a long and sustained effort in order to gain a fortune?'

'I!—Can you doubt it, uncle?' replied Charles, surprised at the question.

'Then you would consent to labour patiently, to work without intermission, to change all your habits?'

'If my doing so would accomplish any purpose—Yes. But why do you make the inquiry?'

'You shall be made acquainted with my reasons,' said the veteran, opening the drawer of a little escritoir, in which he kept the old newspapers which were lent to him by one of his fellow-lodgers. He searched some time amongst them, and at last took out one, in which he pointed out to Charles an article which he had marked.

The young man read it half aloud. 'Some steps have lately been taken with the Spanish government for the recovery of a treasure buried on the banks of the Douro after the battle of Salamanca. It would appear that in the course of this famous retreat, a company belonging to the first division, to whom the charge of several tumbrils had been committed, was separated from the main body of the army, and surrounded by a force so superior to themselves, that any attempt at resistance would have been in vain. The commanding officer, seeing that no hope remained of being able to cut his way through the opposing forces, took advantage of the darkness of the night to have the tumbrils buried in the earth by some of his soldiers in whom he reposed implicit confidence, then, feeling assured that no one would be able to discover them, he ordered his little band to disperse, so that they might each separately endeavour to escape through the lines of the enemy. Some few had the good fortune to succeed in rejoining their division; but the commanding officer, as well as all the men who knew where the tumbrils had been concealed, perished in the attempt. Now it has been positively affirmed that in these tumbrils were contained the money required for the expenses of the whole invading army—namely, a sum of about three millions.'

Charles paused: his eyes sparkled with delight; and he looked inquiringly at the veteran. 'Were you one of that company?' he exclaimed.

'I was,' replied the soldier.

'You know of the existence of this dépôt?'

'I was one of those whom the captain charged to bury it, and the only one amongst them who did not fall beneath the heavy fire of the enemy.'

'Then you could give some indication on the subject; you could help to find them?' inquired Charles anxiously.

'So much the more readily,' replied Vincent, 'because the captain made us take as our point of *reconnaissance* the parallel bearings of a rock and two hills which helped to mark out the spot.'

'So you would remember it?'

'I could point it out as precisely as the position of the bed in this room.'

Charles sprang from his seat. 'Your fortune then is made!' he exclaimed energetically. 'Why have you been silent so long? The French government would have accepted any proposition you might have made to them.'

'Very likely,' replied Vincent; 'but anyway, my information could have been of no use.'

'Why so?'

'Spain refused the required permission: look at this.'

He held out to the young man a second paper, which announced, in fact, that the demand for permission to search for the tumbrils which had been buried by the French in 1812 on the banks of the Douro had been refused by the government of Madrid.

'But could one not do without this permission?' inquired Charles. 'Where is the necessity of attempting officially a search, which might be made quietly without any display. Once upon the spot, and the ground purchased, who could prevent the search?'

'I have thought about it many a time for the last thirty years,' continued the soldier. 'But where was I to find the money necessary for the expenses of the journey, and for the purchase of the field?'

'Would it not be possible to apply to some one richer than ourselves, and to put them in possession of the secret?'

'But how should we make them credit our report?—or prevent our confidence being abused, if they did believe it? And if by any chance we should fail in the attempt, or if it should turn out, as in the fable, that when the hour of partition came, the lion should keep the whole of the prey for himself, should we not then, in addition to the fatigues of the journey, and the uncertainties of success, have to brave the miseries of a lawsuit? Of what use would all this be, tell me? Is it worth my while to take so much trouble for the few days I have yet to live? No, no; the millions may rest in peace as far as I am concerned. I have a retired pension of two hundred francs: thanks to the good help of my little Susan, that, with the small yearly sum attached to my cross, is sufficient to supply me with tobacco and my daily rations. I laugh at all other wants as I would at a detachment of Cossacks.'

'And so you will let this opportunity escape you?' continued Charles with feverish earnestness. 'You will refuse all this wealth?'

'For myself, most cheerfully,' replied the old man; 'but for you it would be different. I could perceive just now that you were ambitious; that you would consider no sacrifice too great which would enable you to acquire riches. Well, then, amass the sum which would be necessary for our journey, and I will accompany you to the spot.'

'You!—Are you in earnest?'

'Earn two thousand francs, and then I will bring you to the very spot where the treasure lies concealed. Will that satisfy you?'

'Satisfy me, uncle!' cried Charles in a transport of joy. Then checking himself, he added in an anxious

tone, 'But how can I ever scrape together so much money? It never can be done.'

'Work courageously, and bring me your pay regularly every week. I promise you there will be no difficulty in accomplishing it.'

'Remember, uncle, what a trifle the savings of a workman can amount to.'

'That is my look-out.'

'How many years will be necessary?'

'You were just now ready to sacrifice eighteen years, as well as an eye and an arm, in the same cause.'

'Ah, if I were only sure!'

'Of acquiring a treasure? I swear to you by the ashes of the *Little Corporal* that you shall.'

This was the soldier's great oath. Charles saw that he was serious in the matter. Vincent encouraged him anew, by assuring him that his future fate lay in his own power; and the young man retired to rest resolved to begin a life of sober and careful industry.

But the hopes awakened within him by his conversation with his uncle were too splendid to allow of his sleeping. He passed the night in a sort of fever, calculating the means of gaining as quickly as possible the desired sum; settling how he would employ his future riches; and passing in review, one after another, as realities, all the chimeras which heretofore had only floated like dim visions before his imagination. When Susan came down next morning, he had already gone off to his work. Vincent, observing her surprise, nodded his head and smiled, but said nothing. He had recommended secrecy to the young workman, and resolved to maintain it himself. Moreover, he wished to see whether Charles would persevere in his good resolutions.

The first months of trial were full of difficulty to the young workman. He had contracted habits which it required no small resolution to break through. Incessant work seemed insupportable to him. He was now obliged to struggle against that capricious fickleness of purpose which hitherto had influenced his actions, to surmount the impulses of weariness and disgust, and to resist the importunities of his former companions in dissipation.

This was at first a difficult task. Many a time his courage failed, and he was upon the point of returning to his former habits; but his earnest desire to attain the proposed end reanimated him in his course. Each time that he brought to the veteran his weekly savings, and perceived how insensibly they were increasing in amount, he experienced a renewal of hope which gave fresh ardour to his endeavours—it was only a little step towards his end, but still it *was* a step. Besides, each day the effort became easier; for in proportion as his life became more regular, his tastes took a new direction. The assiduity with which he laboured throughout the day rendered his evening repose more welcome; the separation from his noisy and reckless companions lent a new charm to the society of his uncle and his cousin. Susan, too, had recovered her gaiety, as well as her frank familiarity of manner. Her every thought was given to her aged uncle and to Charles; and each day her careful love adorned their humble home with some fresh charm, and drew still closer those bonds of tenderness and affection which can make the lowliest dwelling the abode of happiness and peace. Charles was quite surprised at finding in his cousin attractions which he had never before discovered. She became insensibly each day more necessary to his happiness. Without his being aware of it, the aim of his life was gradually changing; the hope of attaining the treasure promised by Vincent was no longer his only spring of action: in all he did, he now thought of Susan; his constant desire was to merit her approbation, to become dearer to her.

The human soul is a sort of moral daguerreotype: let it be surrounded by images of order, of industry, of self-devotion; let it be illuminated by the sunshine of affection; and each of these images will imprint themselves upon its surface, and remain there for ever firmly fixed.

The life which Charles was now leading gradually extinguished his ardent ambition: he saw within his reach a purer and simpler happiness than any of which he had ever before formed a conception; his paradise was no longer a fairyland, such as the 'Arabian Nights' depict, but a narrow circle, peopled with homely joys which he could without difficulty embrace within his grasp. And yet this transformation, visible to all around him, remained a secret to himself. He did not know that he was changed, he only knew that he was more tranquil and more happy. The only new feeling of which he was conscious was his love for Susan. The treasure he was labouring for, instead of being his principal object, he now looked upon only as a means towards making his union with Susan more joyous. He looked forward to it as an important addition, but still only as *accessory* to higher hopes; also he now began to feel the greatest anxiety to know whether his love was shared.

He was one evening pacing the little apartment, while Vincent and Susan were chatting together beside the stove. Their conversation turned on Charles's former master, who, after thirty years of a life passed in honest labour, had just put up to sale his little bookbinding establishment, that he might retire to the country with his aged wife for the remainder of his days.

'Now that is a couple,' said the old soldier, 'who knew how to turn this world into a paradise; always of one mind, always in good-humour, and fully occupied.'

'Yes,' replied Susan thoughtfully, 'the richest couple on earth might well envy their lot.'

Charles, who had just then approached the stove, stopped a moment, and looking fixedly at his cousin, inquired, 'Then you would like your husband to love you, Susan?'

'Why, yes—certainly—if possible,' she replied, smiling, and slightly colouring.

'You can have your wish then,' said Charles warmly. 'You have only to say one word.'

'What word, my cousin?' said Susan with some emotion.

'That you will accept me for your husband,' replied the young man: adding with respectful tenderness, as he saw the surprise and confusion which this abrupt avowal of his intentions had produced in his cousin, 'Oh do not let that annoy you, Susan; it has long been my most earnest desire to ask you this question. I only waited on account of a certain reason with which my uncle is acquainted, but you see how it has escaped me against my will; and now only be as frank as I have been. Tell me whether I may hope that you can love me; our good uncle is there, so that you need have no fears that you are doing wrong.'

The young man's voice faltered; he took his cousin's hand, which he pressed within his own, and a tear trembled in his eye. Susan was silent, for her heart was too full to speak: and the old soldier looked at them both with a smile of mingled playfulness and feeling. At length putting his arm around the young girl, and drawing her gently towards Charles, he said gaily, 'Well now, speak, my little one.'

'Susan!' exclaimed her cousin, still holding her hand; 'one word, only one word—will you be my wife?'

She hid her head upon his shoulder, and a half-articulated 'Yes' escaped her lips.

'Eh, well now, I declare,' cried Vincent, clapping his hand on his knee, 'there was a great deal of difficulty about saying that much. Now you must both give me a kiss,' said he, kindly taking their hands. 'I will leave you this evening for talking over your secrets, and to-morrow we will speak of business.'

The next morning the old man, taking his nephew aside, announced to him that the sum which was required for their journey was now complete, and that they might set off for Spain as soon as they pleased. This news, which ought to have enchanted Charles, filled him, on the contrary, with painful emotion. To

think that he must leave Susan at the very moment when their intercourse was becoming such a source of happiness—that he must encounter all the uncertainties of a long and difficult journey, when it would have been so sweet to stay in his now happy home! The young man was almost ready to curse the millions which he must go so far to seek. Since the time when he had gained a new object of interest in life, his desire for riches had gradually lost its hold upon his mind. What use was there in seeking for wealth to purchase happiness?—he had found it already. He did not, however, express these thoughts to his uncle, but merely declared himself ready to accompany him at an hour's notice. The old soldier reminded him that age was less hasty than youth in its movements, and asked for a few days' delay previous to their departure. 'Meanwhile, I wish, Charles,' said the old man, 'that you would borrow from our neighbours those old newspapers which tell of the famous *dépôt* on the banks of the Douro; we can look over them carefully together, and may perhaps find some information that shall be useful to us on our arrival there.'

The young man having made the desired application, they were, in the course of half an hour, seated side by side, poring over some well-thumbed papers. Charles at first found only the details with which he was already familiar—the refusal of the Spanish government—the fruitless researches of some Barcelona merchants. He thought that every document had been read, when his glance rested upon a letter signed by a certain P. Dufour.

'Peter Dufour!' repeated Vincent; 'that was the name of the quarter-master of the company.'

'So he is called here,' replied Charles.

'Heaven save me! I thought the brave old boy was in the other world long ago; he was the confederate of the captain. Let us see what he has to say for himself.'

Instead of answering, Charles uttered a cry of disappointment; he had looked over the letter, and on perusing its contents, had turned deadly pale.

'What on earth is the matter?' inquired Vincent.

'The matter indeed!' repeated the young workman.

'The matter is, that if Dufour speaks truth, we may as well stay at home.'

'Why?'

'Because the tumbrils were filled with powder instead of silver!'

Vincent clapped his hand to his forehead with an exclamation of surprise and disappointment. Susan laid down her work, and fixed her eyes mournfully on her cousin. The latter was the first to recover from the stupor occasioned by this unexpected discovery. After a few moments, he rose up with a look of cheerful animation, and approaching Susan, seized her hand, exclaiming, 'After all, here is my best treasure—one I would not give up for all the silver that may be buried in Spain and France too! So cheer up, good uncle, and let us make the best use of what is left to us. With true hearts and strong hands we can never be poor. Can we, Susan?'

'Never,' she replied; and her eyes expressed even more unbounded confidence than was implied in the single word uttered by her lips.

The old man slowly raised his head, and repeated the well-known proverb, '*L'homme propose mais Dieu dispose*.' Then, after a moment's thought, he continued, 'I hoped to have seen you both wealthy before I died; but perhaps it is best as it is. Don't let us forget, however, your savings, Charles—Peter Dufour's letter cannot rob us of the two thousand francs; and,' added he, smiling, 'I have some savings of my own, thanks to the management of this good girl: we will see what can be done with it all.' So saying, he rested his head on his elbow, and seemed for a while lost in meditation. At last he raised his head, and cried out joyously, 'I have it—I have it!'

'What have you, good uncle?' exclaimed the young people simultaneously.

'Patience, patience,' replied the veteran with a knowing smile; 'you shall know it all in good time. Will you call a hackney-coach for me, Charles? I have some business out, and it is still early in the day. Susan, child, I shall want you to come with me.'

His desire was obeyed; and as he drove through the streets, he acquainted her that his heart was set upon establishing them both in the business which had been just relinquished by Charles's former master. 'And,' added he, 'Mr Lebrun is an honest man, and will stand me a helping hand in the business. What say you to my plan, child?'

'Oh it would only make me too happy, dear uncle,' she gratefully replied.

They called on Mr Lebrun, and were so successful in their negotiations, that on being again seated in the coach, the old man knocked his stick with vehemence on the floor, exclaiming, 'By the ashes of the Little Corporal he shall have it!' Susan kissed his hand with joyful affection. 'Only let me see you settled in your own *ménage*, and I shall die happy,' said the old man with some emotion. 'But remember, Charles is to know nothing about all this yet,' he continued, looking earnestly at the young girl.

'It will be very hard to keep it from him, uncle.'

'But it must be kept,' rejoined Vincent in a decided and somewhat grave tone.

Susan was silent; for she knew there was no appeal from such a decision. It was very difficult, however, for her to keep this secret from her lover; and it would have been still more so, but that Charles was so fully occupied at this moment, that he had little leisure for conversation.

About a fortnight afterwards, on a fine holiday, Vincent proposed to the young people that he should treat them to a drive. 'And afterwards,' continued he, 'you can go out together, and enjoy more of what is going on.'

This they joyfully acceded to. At the end of a few minutes' drive, to Charles's great surprise the carriage stopped at the door of the *magasin* which had formerly belonged to his old master.

'What is the man about?' he inquired rather impatiently.

'We shall see, we shall see,' replied the old man smiling.

The steps were let down. Vincent, leaning upon Susan, got out, and entered the shop. Charles was about to follow them, when the name of 'CHARLES VINCENT,' in large gold letters, placed above the entrance, arrested his eye. For one moment he stood petrified; the next he hastened into the shop, and embracing his uncle and cousin in a transport of joy, exclaimed, 'Ah, this is your secret! and you have kept it from me all this time,' said he reproachfully to Susan.

'It is the last I will ever keep from you,' she replied, looking somewhat confused.

'Yes, yes; it was all my fault; so don't scold her. No scolding to-day,' repeated the old soldier, hobbling into the back room, where a huge block of wood was burning brightly on the hearth, and a small table was laid for dinner. The furniture was plain, but neat, and the tablecloth white as snow. Vincent, shaking his nephew by the hand, said, 'Charles, you are welcome as the master of this house.'

'Thank you, thank you a thousand times, uncle; but,' turning to his cousin, 'I do not care to be the master of it, unless Susan promises to be its mistress.'

'And so she will,' interrupted the old man. 'Don't you remember her promise?'

'Yes, but I wish her to repeat it once more.'

Susan blushed, and gave him her hand.

Need we say what a happy and joyous evening followed this explanation.

Before many days had elapsed, Mr and Mrs Charles Vincent were installed in the formal possession of their new habitation. Susan carried the same cheerful and elastic spirit into her married life which had sustained

herin her earlier and more trying course; and even in her busiest moments, she found leisure to talk with the old soldier, as he sat by the fireside in a comfortable arm-chair, with his beloved pipe and pouch placed conveniently at his side.

A year passed away, and the first anniversary of their wedding-day found this happy trio still happier than on the eventful day which fixed them in their present comfortable dwelling.

At supper, the old man drank to the health and prosperity of the young couple.

'Thank you, good uncle,' said Charles; 'and whatever share of enjoyment may be mine, I have to thank you for much of it, as it was you who first taught me that happiness does not lie in wealth or distinction, but in a life of honest industry, and a mind at peace with itself. You, too, I have partly to thank,' continued he, smiling and looking at his wife, 'for having given me here a greater treasure than ever I hoped to have possessed, had our expedition into Spain been crowned with the most entire success.'

THE OPPROBRIUM OF MILTON.

OUR readers may remember the famous controversy on the alleged expulsion of Milton from his college, and its termination by a sort of compromise on the part of his defenders. They will perhaps be glad to hear that another belligerent has now appeared on the side of the poet, with the standard of 'No surrender!' and that he seems to have finally set the question at rest.

It is no wonder that the great poet—whose prose would have immortalised him, even if the 'Paradise Lost' had never been written—was the object of every kind of scurrility and calumny. Some of his works were ordered by proclamation of Charles II. to be burned by the common hangman; and his fellow-Christians were called upon by a private assailant to 'stone the miscreant to death.' One of his contemporaries, Winstanley, declared of him that, notwithstanding his possession of some small poetical merits, 'his fame is got out like the snuff of a candle, and will continue to stink to all posterity, for having so infamously belied that glorious martyr and king, Charles I.' Another of them, Aubrey, who was seventeen years younger than Milton, brought against him the specific charge of having been 'vomited, after an inordinate and riotous youth, out of the university;' and even Johnson, in a new generation, suffered his church-and-state feelings to influence his judgment both of the poet and the man. 'I am ashamed,' says he, 'to relate what I fear is true, that Milton was one of the last students in either university that suffered the public indignity of corporal correction.'

To prove these charges, there were no college entries, and no contemporary reminiscences brought forward. The sole evidence was some words in a Latin elegy of his own; and yet this elegy he himself republished, with all its supposed damning proof, not more than two or three years after the charge by Aubrey, to which he replies as follows:—'I must be thought, if this libeller (for now he shows himself to be so) can find belief, after an inordinate and riotous youth spent at the university, to have been at length "vomited out thence;" for which commodious lie, that he may be encouraged in the trade another time, I thank him; for it hath given me an apt occasion to acknowledge publicly, with all grateful mind, that more than ordinary favour and respect which I found, above any of my equals, at the hands of those courteous and learned men, the fellows of that college wherein I spent some years; who, at my parting, after I had taken two degrees, as the manner is, signified many ways how much better it would content them that I would stay; as by many letters full of kindness and loving respect, both before that time and long after, I was assured of their singular good affection towards me.' In his Second Defence, he says still more distinctly, that his father sent

him to college, where he studied for seven years with the approbation of the good, and without any stain upon his character, till he took the degree of master of arts.

The elegy, however, according even to the more friendly commentators, was not entirely to be got over. They absolved him from expulsion, but consented to a verdict of rustication: in the Irish fashion, they split the difference. The verses that bear upon the question are as follow, with the criminatory words in italics:—

* Me tenet urbs refluâ quam Thamesis alluit undâ,
Meque nec invitum patria dulcis habet.
Jam nec arundiferum mihi cura revivere Camum,
Nec dudum *vetiti* me *luris* angit amor.
* * * * *
Si sit hoc *exilium* patrios aditæ penates,
Et vacuum curis otia grata sequi,
Non ego vel *proptus* nomen sortemur recuso,
Lætus et *exili* conditione fruor.*

We now give the literal and obvious translation of these verses:—

The city which the Thames laves with reflux wave detains me,

And my sweet native place possesses me not against my will;

Now I have neither a desire to revisit the reedy Cam,
Nor does the love of a domestic hearth, lately forbidden, torment me.

If this be *exile*—to have visited my father's household gods,

And, free from cares, to follow charming leisure—
I refuse not the name or the lot of a *banished man*,
And gladly I enjoy the condition of *exile*.

The commentators could not bear entirely up against this evidence. The poem refuted the charge of expulsion, because the author, towards the close, talks of returning to Cambridge; but Warton declared that the italicised words would not suffer us to determine otherwise than that Milton had suffered sentence of rustication, or temporary removal from college; and Johnson thought that no other meaning could be given, even by kindness and reverence, to the term *vetiti laris*, 'a habitation from which he is excluded.' Succeeding writers followed on the same side; and thus it was settled that the great poet had suffered at least a temporary banishment from his *alma mater*, in punishment of some transgression of the rules, or some offence he might have given to the governors of the college.

This may seem at first sight a small question, but in reality it is a very important one. The rustication of Milton has often served as an excuse to meaner spirits, and perhaps it may before now have been pleaded successfully with some silly parents. The cause was wholly unknown, but the authors of the original charge of expulsion accused him of profligacy of every kind. Here was an example and apology for all succeeding *roués*; and the youth of 'spirit,' who scorned the decencies of collegiate life, fancied himself a kindred soul with the handsomest of men, the most elegant of scholars, and the most gifted of poets. But as regards Milton himself the question is still more serious. The charge is not confined to rustication—it involves deliberate falsehood. His temporary exile from college might have been caused by some very venial trespass, perhaps by a praiseworthy, even a religious scruple; but his solemn denial, if the fact were true, would throw a stigma upon his character, which the brilliance of his genius would only render more conspicuous.

But Milton did not merely deny the fact; he collected for publication, in less than three years afterwards, his Latin poems, and placed the elegy *Ad Carolum Deodatum* (the one referred to above) the first in the series. It is strange that this unconsciousness should have struck even the more friendly commentators as something merely tending to disprove the charge of actual expulsion, while they still considered that of rustication as completely established! But so it was; and thus the matter rested, till the appearance of an article in the last number of the 'Classical Museum,' in which

Dr Maclure, one of the classical masters in the Edinburgh Academy, shows that the meaning of the ode has been mistaken from first to last, and explains the otherwise unaccountable unconsciousness of Milton by the simple fact, that it does not contain one word which can justify the interpretation affixed to it by the learned and adopted by the ignorant.

'It is surprising,' says Dr Maclure, 'that in the face of these remarkable passages, which could not have been penned by one who was conscious of having incurred disgrace at college, the expressions in the elegy should ever have been construed, I need not say by "kindness and reverence," but even by malevolence and contempt, so as to lend support to a slander thus indignantly repelled by the object of it! To me it seems clear as day, that when properly interpreted, they afford not a shadow of countenance to the injurious calumny. They occur in an elegy written in London during a vacation, in the poet's eighteenth year, and addressed to his schoolfellow and friend Charles Deodate. This gentleman, after leaving Oxford, had established himself in Cheshire, whence, as appears from the poem, he addressed an epistle to Milton, probably a poetical one, in which it would seem, ignorant of the feelings with which his friend had come to regard the university, he consoled with him on his absence from it during the vacation, and spoke of this temporary separation as a *state of exile*. This view of his position in London Milton repudiates in terms not very complimentary, I grant, to his *alma mater*, but which most assuredly do not support the imputation that has been founded on them. But it will be said, admitting that in this way the use of the words *exilium* and *profugus* is explained, how do you account for the phrase *dudum vetiti laris*? Nothing is easier: indeed I am filled with surprise that its true meaning has so long escaped discovery. The commentators have hitherto understood these words as if they referred to the poet's cheerless apartments in Christ College, Cambridge! Milton was too good a Latinist ever to employ the word *lar* for a purpose so unsuitable. He uses it here in its only proper sense—to denote his *home*, his *father's fireside*, to revisit which during term-time had, by the discipline of his college, been *lately forbidden him*. In short, he enumerates amongst the delights of his present situation, freedom from the home-sickness with which he used to be tormented at Cambridge. When read in this light, the passage assumes consistency with itself, with other portions of Milton's writings, and with the register of his college; and what is perhaps of higher importance, while it rescues the memory of the greatest poet and one of the ripest scholars of England from a shade that has long rested on it, it deprives giddy and thoughtless youth of a precedent they are fond of quoting for their own irregularities and contumacy.'

In order to show at a glance the effect of this new reading, we will slightly paraphrase, in the points referred to, the literal translation given above:—

The city which the Thames laves with reflux wave
detains me,
And my sweet native place possesses me not against my
will;

Now I have neither a desire to revisit the reedy Cam,
Nor does the love of my father's fireside, lately for-
bidden me during term-time, torment me.

If this be what you call exile—to have visited my father's
household gods,

And, free from cares, to follow charming leisure—
I refuse not the name or the lot of a banished man,
And gladly I enjoy the condition of exile.

The correctness of this construction of the last four verses is probable from the fact, that the elegy is a reply to his friend's epistle—a circumstance which former commentators appear to have overlooked; while that of the first four requires merely a moderate knowledge of Latin to insure acquiescence at once. Indeed,

now that the thing is pointed out, the translation Johnson gives of *vetiti laris* seems little less than absurd. The word *lar* is one of the most expressive in the language. It is not merely 'a habitation': it is a home in the deepest meaning of the term—a hearth hallowed by the spiritual presence of the household god. It is quite beyond belief that an accomplished Latinist like Milton could apply such a name to his solitary room, at a college of which he takes so little pains to conceal his dislike and contempt.

Dr Maclure is entitled to our thanks for the light he has thrown upon this interesting point in literary history. Himself a Schoolmaster, he has proved to be so far more *au fait* of the trade than his brother schoolmasters Warton and Johnson; and he has relieved from unmerited obloquy the character of the illustrious schoolmaster Milton.

BYRNE ON SOUTH AUSTRALIA.

MR J. C. BYRNE presents a general work on the Australasian colonies, the result, as he informs us, of several years' personal acquaintance with them. The book, as a whole, does not come up to the expectations excited by the title;* but understanding that titles are generally dictated by publishers, under views of their own—short-sighted ones generally—we are willing to believe that this is not the author's blame. Not having space wherein to follow him over the whole of the colonies which he describes, we deem it best to concentrate attention upon that one which is at present the subject of greatest interest at home.

South Australia is about three times the size of Great Britain and Ireland, the extent of land within its limits exceeding 300,000 square miles. Though during the summer months hot winds, which blow from the northward, occasionally prevail, yet the climate is extremely salubrious, and the air exhilarating, buoyant, and light. Nor do these winds, 'which appear to pass over vast arid regions, where moisture is unknown,' last long, giving place to cool, refreshing, southerly breezes, 'which soon reinvigorate the constitution, and dissipate the effects of the parching gales.' Copious, too, and frequent are the rains which visit this favoured colony, 'whose soil is in general admirably suited for cultivation, and produces the most abundant crops.' 'Scattered,' says Mr Byrne, 'over the vast area of South Australia, there are acres of rich land on which millions of an industrious population might be settled. Besides wheat, oats, barley, and Indian corn, the soil produces hops, tobacco, the vine, and indeed all tropical fruits and plants, with a very few exceptions. The mulberry is now successfully cultivated, whilst the colony bids fair, at no distant date, to become an extensive wine-producing country.' Nor is this all. 'South Australia has proved itself to be well adapted for the growth of the finest wool; and the boundless acres of natural pasturage, not calculated for agriculture, present an extent of country which, even at the rapid rate of increase observed by Australian flocks, it will take many long years to occupy.'

Amongst the population of the colony there are a considerable number of German agriculturists, who have mostly succeeded in acquiring small farms.* Their disposition inclining them 'to acquire a homestead and farm of their own, they dislike remaining in a state of servitude and dependence on others for their daily bread; and to this is attributable the extent of cultivation in South Australia, and the cheapness of grain—these small cultivators being able to produce at a much lower rate than large landholders, who rely solely on the labour of others. This formation of a yeoman class must greatly tend to promote the prosperity of the colony; and in this class of its population South Australia excels both New South Wales and Australia Felix, where there seems to be a desire that only two classes should exist—the great landholder

* Twelve Years' Rambling in the British Colonies, from 1835 to 1847. By J. C. Byrne. 2 vols. London: Bentley, 1848. [The colonies actually noticed are those of Australia and New Zealand.]

and stock-proprietor, and the mechanic and labourer. This is much to be deprecated; and it speaks well for South Australia that the principle is not enforced there. It is a striking fact," adds Mr Byrne, "that although the population of South Australia has not doubled within the last seven years, yet the extent of land actually under cultivation has increased nearly fifteenfold within the same period. In 1840," he next assures us, "the population were about 14,000 in number, the number of acres under cultivation being then only 2503; whereas in 1846 the number of inhabitants amounted to 22,390, and the number of cultivated acres to 33,292. The repeal of the corn-laws," he proceeds, "has opened the home markets, and at present, South Australian wheat is represented as sustaining a very high character with the corn-dealers of London, being quoted at the same price as the best Dantzic, which, on an average, is fully ten per cent. higher than the best home-grown wheat. The Mauritius and Cape of Good Hope also present a near and good market for Australian wheat."

To sheep-farmers it may be important to state, that in South Australia there has, within the last five years, been a rapid and important increase in the growth of wool. In 1842, the wool exported to Great Britain yielded only a return of L.29,749; while in 1846 the returns amounted to L.105,941. We are about shortly to refer to the second great source of Australian wealth—namely, her rich copper mines; but we cannot dismiss the agricultural part of our notice before we have called the attention of the class interested to the following extract:—"One great advantage to the farming class of South Australia lies in the employment afforded them at all seasons, when otherwise unengaged, in carting ores from the mines to the seaport. In the year 1846, the amount paid for cartage by the Burra Burra Mine alone exceeded L.30,000; and as the produce of this mine is largely increasing, and numerous others are being opened, it would be difficult to calculate the amount that will be annually distributed for cartage amongst the South Australian farmers. Already the mine owners have found it impossible to procure in the colony sufficient carriage, so they have resorted to the expedient of advertising in the neighbouring colonies, in order to induce persons to proceed to South Australia and become carriers." South Australia, Mr Byrne thinks, "is eminently and especially the country best calculated for the labouring emigrant." The dark feature is the character of the aborigines. Inoffensive enough in the neighbourhood of Adelaide and the more settled country, on the frontiers of the colony, and especially towards the Murray River, they are fierce and ruthless, exhibiting great hostility to the whites. They are, however, rapidly vanishing from the land—"the firearms of the whites doing the work of annihilation!" This is bad; but, according to Mr Byrne, there is no remedy; for we are told that, though philanthropists have used many efforts to civilise the natives, all attempts to do so have as yet proved failures. Fierce savages they still are, and continue practising cannibalism "from a horrible fondness for the revolting food! nor is there the least hope that the practice will be abolished among them as long as they continue to exist as a race." Let us hope there is a slight portion here of unintentional exaggeration. Mr Byrne had on one or two occasions the misfortune of falling in with several bands of these savages, and of enduring no inconsiderable amount of suffering from their hands. But if the natives in the neighbourhood of Adelaide are gentle and timid, making capital "catchers of strayed sheep," why should we despair of the "Border rascals becoming also, as population increases in their neighbourhood, well-bred, decent, nay, even useful members of society?" That we may not be accused of concealment of facts, let us out, too, with another well-authenticated disclosure of Mr Byrne's: there are at least eighteen different species of snakes, many of them beautiful, and almost all of them dangerous, in the settled Australian colonies!

Having thus considered Australia as a merely agricultural colony, we shall next consider what are the other elements of wealth of which she is actually in possession.

Let us 'begin at the beginning.' South Australia, though as a British colony not yet 'in her teens,' has already, after struggling through dangers and difficulties almost incredible, suddenly merged into affluence, prosperity, and fame. She was made a British province in 1834—her only inhabitants being at the time a few runaway convicts and the cannibal aborigines—and became a British colony in 1836; so that, as such, she is not older yet than eleven and a half years. It is needless to specify all the causes which induced the difficulties in which the infant colony got most foolishly involved: they are matter of history; and it need only be specified that a reckless spirit of speculation ruined everything. From this lamentable state of affairs, repeatedly noticed in these pages, the colony at length revived, and latterly it has become the wealthiest of all the colonies of Britain. This has arisen from a discovery, made in 1844, that Australia, in many of its districts, possesses vast mineral riches. 'The mineral discoveries of 1844,' says Mr Byrne, 'attracted attention, raised all from despondency, and threw a bright gleam of hope over the future.' And now the ultimate effects of its mining operations on British commerce and mineral property in England are at present inconceivable, and must be left to time to develop.

Having given a table of the import and export returns of South Australia from 1841 to 1846, the export return for 1841 being as low as L.40,561, and that for 1846 as high as L.287,059—"What," proceeds Mr Byrne, "the exports of South Australia will be in the course of a very few years, it would be folly to attempt to predict." Copper has become a grand article of export; but this trade is only in its infancy. There is no country on the face of the globe possessed of such rich copper mines, or so accessible to water carriage, as those of South Australia. The Cornwall mines can bear no comparison with them. 'Their value may be said to be three times as great as those of Cornwall, and yet many of the Cornwall mines pay 100 per cent. on the capital embarked in them; of what, therefore, might not the South Australian mines be capable, if their working were encouraged? It is not only the mine-owners and population of the colony who would be benefited by the development of its mining resources; a market also would be created for the consumption of British manufactures, for which the colonists could pay by an exportation of copper required in the home market.' If the mines of South Australia beat those of Cornwall, they also excel the Chilian. 'The working of the Chilian mines is attended with great difficulty and expense, and is mainly carried on by British capital, on which only a small dividend is paid. Situated amidst the Andes, where it is impossible to form carriage roads, the ore has to be conveyed from these mines by strings of mules with wicker panniers slung across them, to distant ports of shipment. The depth of the workings and the length of the galleries are also extreme, and necessitate the employment of thousands of men, whose sole duty it is to convey the ore on their backs in baskets to the outlets of the mine. All this adds to the expense; and the cost of the Chilian ores must very much exceed that of the South Australian ores by the time they arrive at a shipping port; and yet they do not, on an average, exceed, or even equal, much of the colonial ore that has already been imported into England within the year.' After this, we scarcely wonder at hearing Mr Byrne assert that 'under the crown there is no colony that presents such bright prospects for the future as South Australia.' Adelaide, the capital of the colony, occupies the very centre of the immense circle around which her mineral wealth extends. A range of hills, which run north, and nearly parallel to the Gulf of St Vincent, border on this beautiful town; 'mineral specimens have been discovered in every part of this range; but the mines chiefly worked, and which have given such a reputation to the colony, lie to the northward of Adelaide: the chief of these is the Burra Burra Mine,' of which the author gives the following description in a quotation from the letter of a friend:—"In the morning we took an early walk, and obtained a glimpse of the mine from the summit of an intervening hill, but were closely immured for the re-

mainder of the day, in consequence of excessive rain. Early on the following morning our breakfast was cut short by the announcement that Captain Lawson was "waiting to accompany us under ground," at the principal workings; and having provided ourselves with subterranean "toggery," we made a hasty but becoming toilet, and hastened to attend our kind conductor in his descent. The huge cargoes which have been shipped, the piles of ore we had seen at the port, the hundreds of draught oxen and laden drays we met in their progress to the wharf, the thousands of tons of ore around the workings and near the intended smelting-house, their daily accumulations, and the reports of credible, unbiassed witnesses, had prepared us to expect much; but before we had passed through a single gallery, as the larger horizontal diverges or levels are very properly called, we saw enough to convince us that we had commenced the examination of a mine incomparably richer and more productive than any mine of any kind we had ever seen in the United Kingdom.

We passed through a succession of galleries and chambers, as the larger excavations are justly termed; one of them being large enough to hold a congregation of a hundred or two persecuted Covenanters, and sufficiently lofty for the pulpit and desk, which those simple but devout worshippers managed to dispense with. In our progress we had to ascend successive perpendicular ladders, with a lighted candle retained between the forefinger and thumb; afterwards to make our descent by similar contrivances, and others much more rude; until, in divers windings, prostrations, twistings, turnings, clamberings, and examinations, we had spent nearly three hours under-ground, and passed through or looked through the greater part, if not all the extensive subsoil operations.

In addition to the Burra Burra, Mr Byrne enumerates a number of copper mines already opened, which, for richness and variety, are almost its rivals—such as the Princess Royal, the Kapunda, the Montacute, the Rapid Bay, and the Wakefield: to all this prosperity we find two drawbacks—and as we have already advised intending agricultural emigrants of the existence in these lands of snakes and anthropophagi, so to those who may think of purchasing mineral ground we also exhibit the worst, as we have done the best view of the matter. The want of coal is therefore, we say, stated to be a considerable barrier, as it renders the smelting of the ore on the spot where it is dug to a great extent impossible; but the matter is far less hopeless, in Mr Byrne's estimation, than the reformation of the aborigines—for hear how the difficulty is got over:—"A recent discovery of the application of electricity to smelting copper will create a complete revolution both in the intentions and prospects of the mining interest of South Australia." Again: "The island of Van Diemen's Land is at the distance of only a few days' sail from Port Adelaide, and there coal abounds in most available situations for shipping. This coal could be imported at an average price of from ten to twelve shillings per ton on an extensive scale; and then the question would arise, whether it were better to bring the coal to the copper ore, or the latter to the former? Some of the inhabitants of the colony did propose to erect smelting-houses on a small island composed almost exclusively of coal, which lies off the coast of Van Diemen's Land, and where there is good anchorage; but the scheme does not appear to have been followed up, on account of the lethargy of the authorities and mercantile classes of the island." Although we do not intend to hazard an opinion on the merits of the question, we must remind the reader of the existence of what is called the 'royalty tax.' So soon as specimens of the copper ores of Australia reached England, they were pronounced by the most eminent judges to be amongst the richest imported into this country from any part of the globe. Alarmed lest the working of mines should withdraw agriculturists and others from their field labours, and regarding it as but reasonable that mining property should contribute somewhat, in proportion to the amount of labour it absorbs, to the fund by which the expense of introducing emigrants of the labouring class is pro-

vided for, Earl Grey, on the 20th December 1846, confirmed a royalty tax imposed by the governor of the colony, with the consent of his council, in the March of the same year, of one-fiftieth 'upon all minerals raised from lands thenceforward to be alienated from the crown.' When this tax was first announced, the colonists were, we are told, highly indignant, and its total repeal is still demanded. Notwithstanding all this, Mr Byrne, addressing the numerous families in England possessed of a small competence, but who are anxious about the future maintenance of their children, does not hesitate to say most emphatically, 'transfer yourselves to South Australia; you will there obtain three times the interest of your money, and you will be able to live at less than half the cost, whilst to the younger branches of your families many sources of employment will be opened, for there is no such excessive competition as exists at home.'

All kinds of labourers, mechanics, and domestic servants earn capital wages in South Australia. Professional men are not in requisition, there being too many of that class already there. 'In the constitution of its society,' we are told, 'South Australia has been especially favoured; comparatively few persons who have been convicts have crossed to this colony, and among her original colonists were a large number of men previously occupying most respectable positions in England—men of intellect, talent, and perseverance; and even her emigrants were originally chosen with a care seldom exercised in the case of any other colony. . . . Much good society is to be met with in Adelaide: ladies bright, fair, educated, and accomplished; and gentlemen who would not suffer by a comparison with any other colonists in the world. We regret to learn, however, that at the mines the large wages earned by the men generally promote intoxication; and indeed over all the colony drinking too much prevails.'

Adelaide possesses a theatre, a savings' bank for the lower classes, besides three or four lodges of freemasons, half-a-dozen of the Odd Fellows, and an abstinence society. There are also four newspapers published in Adelaide, two of them twice a-week, the others weekly; not to mention a subscription library supported by the more respectable inhabitants. But we must now draw to a close. Before doing so, however, it is but fair to say that, in order to render our article useful to the general reader, we have scarcely, by our extracts, done justice to the work of Mr Byrne.

STRUGGLES FOR LIFE IN THE METROPOLIS.*

The Garret Master.—This is not a title assumed by any particular class, but rather a sobriquet bestowed upon one who cannot correctly be said to belong to any. He is operative and manufacturer, merchant and labourer, combined in one person; and has dealings both wholesale and retail, after a fashion of his own. No man can rightly accuse him of sapping our commercial system by an undue extension of credit, seeing that it is very rarely that he trusts anybody, and still more rarely is anybody found who will trust him. He works at any easy trade, and manufactures articles of every sort or description that may be wanted, which he has wit or ingenuity enough to turn out of hand. Two things are essential to a man's becoming a garret master: in the first place, he must be able to practise some occupation which requires but little capital to set him up in business; and in the second place, he must be unwilling, either from a spirit of insubordination, a love of idleness, or a feeling of independence, or else incapable, from want of average skill in his calling, to work as a journeyman. Whatever be his motive, it can hardly be the love of gain, since his profits, so far at least as one can judge from his personal appearance and domestic surroundings, must fall far short of those of an average workman. There may be some few exceptions to whom this general character is not appli-

cable; indeed I know there are; but the more respectable of the number would, I have reason to think, subscribe to the truth of this delineation of the general body—if body they can be called—who live in perfect isolation, and never come together.

Every one who walks the streets of London, if he ever exercise his observation at all, must have remarked, amongst the infinite variety of wares disposed for sale inside and outside of the endless array of shops that line the public thoroughfares, a prodigious number of articles which are not, properly speaking, the production of any particular or known species of handicraft; or if some of them be such ostensibly, it becomes apparent upon inspection, and upon a comparison of prices, that they are not the manufactures of well-practised hands, but are hastily and fraudulently got up, to defude the eyes of the unwary by the semblance of workmanship. Picture-frames, looking more like gilt gingerbread than carved gold, which they should resemble; small cabinets of cedar-wood, and miniature chests of drawers, which seem to stand midway between a toy and a domestic implement; easy (to break) chairs, which a man of fifteen stone would crush to pieces; mirrors of all sizes, each one affording a new version of your astonished face; slippers and clogs of every possible material; boys' caps at half-a-crown a dozen, of every variety of shape and colour, manufactured from the tailors' clippings; whetstones of every geological formation—*trap* (for customers) predominating; cribbage-boards, draught-boards, dominoes, and chess-men, at any price you like; work-boxes, writing-desks, and music-stands, glued together from the refuse of a cabinet-maker's workshop; carpenters' tools incapable of an edge, among which figures a centre-bit, with twenty pieces, for five shillings—a bait for amateur mechanics, which has astonishing success; towel-horses, that will fall to pieces if not tenderly handled; and flights of steps, leading to a broken head, or something worse—all demand attention by their plausible appearance and astonishingly low price. But these are not all. The heedless bargain-hunter may find away a good round sum as easily as the veriest trifle. Gaudy pianofortes, magnificent-looking instruments, labelled 'Broadwood' or 'Collard,' may be had at 'an immense sacrifice' (this is true in the buyer's case), which ought to be warranted not to stand in tune for twenty-four hours, and to become veritable tin-kettles in a twelvemonth. Horrible fiddles, by the thousand, constructed only to sell and to set the teeth on edge, lie in wait for the musical tyro; seraphines that growl like angry demons, until they become asthmatic, when they wheeze away their hateful lives in a month or two, are to be found in every broker's shop, together with every other musical instrument you could name; all uniting to prove that if the best articles are to be procured in London, so are the worst, and that too in abundance.

Nor does the evil stop here. 'The world is still deceived with ornament,' and the imitators of things real know it well, and make a good market by the knowledge. Wo to the scientific student who, anxious to economise his funds, buys his necessary instruments of any other than a well-known and established maker! In no department of manufacture is there a more profitable field for humbug and plunder than in this. All descriptions of scientific instruments, surgical, optic, chemical, engineering, and others, abound in every quarter—the pawnbroker being the chief medium or middleman through whom they find their way to the luckless experimentalist. Telescopes with conveniently soiled lenses; camera-lucidas, by means of which Argus himself could see nothing; scalpels, lancets, and amputating knives, never intended to cut; surgical saws with tender teeth; air-pumps in want of sucker; pentagraphe, with rickety joints and false measurements; unseasoned glass retorts; crucibles sure to split on the fire; opera-glasses with twopenny lenses in tubes of specious magnificence; and a thousand other things, which are manufactured weekly in large quantities, but never for

any other purpose than to pawn or to sell, are to be met with in every street, and proclaim the industry of a class of operatives whose labours are anything but a benefit to the general community.

It is not my intention to lay all these enormities upon the shoulders of the garret master; indeed many of the manufacturers of the vile wares above-mentioned are men of considerable capital, those especially who fabricate and deal in the more expensive articles. But yet justice to the subject of this sketch compels me to declare that the guilty parties are mainly members of his class; although individuals are not wanting among them, the history of whose lives would present the praiseworthy struggle of industry and integrity against adverse circumstances. If the reader will accompany me to the narrow theatre of his operations, he may behold the garret master in the midst of his avocations, and then form as lenient a judgment as the somewhat singular spectacle will admit.

On a summer evening in the year 184—, having been requested by a country correspondent to make inquiries respecting the execution of a commission intrusted to one of this tribe, I set out in the direction indicated in his letter, and arrived at the door of the house in which the garret master dwelt about half an hour before sunset. The place was a back street running nearly parallel with Holborn, in the neighbourhood of one of the inns of court, and one that, judging from the height and structure of the houses, had once laid claim to a character for respectability, not to say gentility: but all such pretensions had evidently long been given up; and the lofty dwellings, fashioned originally for the abodes of easy and comfortable independence, now stood in begrimed and dingy neglect, the uncared-for tenements of the artisan and the labourer. The door of the house I entered stood fastened open; and the loose boards of the bare passage, wanting scraper, mat, and oil-cloth, bent and clattered under my feet. The walls, from the door to the summit of the utmost stair, were of a dark-brown colour, arising from the accumulated soiling of half a century, and polished by the friction of passers up and down, except where some few tatters of the original papering yet hung about them, or where the plaster had been knocked away, through the careless portage of heavy articles. The banisters as far as the first floor were in tolerable repair, though some of the rails showed by their want of paint that they were substitutes for others which had left the rank. Higher up, they were half deficient; and near the top storey had been removed altogether, probably for fuel, by some starving inmate, and replaced by a fence of rough slab deal. Of this I was rather sensible by touch than by sight; for the skylight that should have illuminated the staircase was covered over, with the exception of one small cranny, plainly to exclude the weather, which would else have found entrance through the broken panes. I should be sorry to afford the reader too accurate a notion of the villanous odour that infected the atmosphere of the house; it would have perplexed even Coleridge—who said that in Cologne he 'counted two-and-seventy stench'—to have described it. It seemed a compound of spirits, beer, and stale tobacco, of rancid oil or varnish, with a flavour of a dog a month dead. I should mention that I knocked at one of five doors on the third floor, when three of them suddenly opened, but not the one to which I had applied my knuckles. Three dirty-faced matrons in dishabille, two of them having infants at the breast, made their simultaneous appearance, and inquired what I wanted; one of them informing me that 'the doctor' was not within, but would be found at the — tap. Mentally wondering who 'the doctor' thus domiciled could be, I stated that I had business with Mr T—, and requested to be shown his door. 'It is the fifth door on the floor above,' said the woman who had mentioned 'the doctor,' withdrawing as she spoke. Arriving at the door in question, I could hear a murmur of voices, and the whirling of a wheel in rapid motion. The door was opened immediately at

my summons, and the rays of a lurid sunset streamed in upon the landing-place. The woman who answered the door seemed astonished at my unlooked-for appearance, and plainly expected a different party. As she drew back to make room for my entrance, a scene met my view, too common, I fear, in the industrial resorts of our great cities, but one calling aloud for amendment and redress in every possible particular. In a room, the dimensions of which might be about sixteen feet by eleven or twelve, were living an entire family, consisting of certainly not fewer than eight persons. Near a stove, placed about a yard from the fireplace, the funnel going into the chimney through a hole in the wall above the mantelpiece, sat the garret master, Mr T—, in the act of filling his pipe. Beyond a shirt, dirty and ragged, canvas trousers, and a pair of old slippers, cut down from older boots, he had nothing on his person, if we except a beard of a month's growth. A lad of seventeen or eighteen, similarly non-dressed, whose unwashed flesh peeped through a dozen rents in his garments, was busy at an old rickety lathe turning pill-boxes, some gross of which were scattered on the board in front of him; as he turned for a moment at my entrance, he showed a face haggard and wan, the index of bad diet and early intemperance. Seated at a carpenter's bench, which, together with the lathe, occupied the whole portion of the room next the window, was a girl of nineteen or twenty, engaged in carefully spreading gold leaf upon the word 'cupping,' previously written with varnish upon a strip of glass. Her costume, surmounted with a tattered man's jacket, would have disgraced the 'black doll' usually suspended over a rag-shop; the same indication of semi-starvation and (alas that it must be said!) of intemperance was legible in a countenance that ought to have been, and indeed was once, interesting. At the end of the bench, in the corner of the room, a boy of twelve or thirteen years was occupied in French-polishing a few small and showy frames adapted for the reception of the glass labels. At the other corner, to the left of the lathe, was a still younger child—I can hardly say of which sex—busily fitting the covers to the pill-boxes, and laying them in dozens for package; while an infant of scarce three years was asleep in the shavings under the bench, where, it was evident from the presence of the brown and grimy blanket-rags, he would be joined at night by other members of the family. There was no bedstead in the room; but what was presumably the bed of the parents—a heap of filthy bundling—lay on the floor between the door and the corner of the apartment. While I was making inquiries concerning the commission of my country friend, the mother stepped between me and the father, to whom I had addressed myself, and intimidated by a look of shame, alarm, and intreaty, that she was the more fit party to be questioned. The man, however, told her with an oath to stand aside; to which command she paid no attention, but proceeded to inform me they were on the point of completing my friend's order, and that the goods should be forwarded to my address, if I would leave it, early on the following morning. While she was speaking, I heard a light foot on the stairs; and the door opening, a little girl of about six, almost decently clad in comparison with the others, entered the room, clasping a black bottle carefully in both hands. The mother, apparently unwilling that a stranger should be aware of the nature of the burden brought by the child, was about concealing it in a cupboard; but the father, who, I now for the first time perceived, was on the high road to intoxication, swore at her angrily for pretending to be ashamed of what he proclaimed she liked as well as anybody, and loudly demanded the gin bottle. With a sigh and a look of shame she complied with his desire, when he immediately applied himself to the contents with an air of dogged satisfaction. The child who had brought in the gin was the only one of the family that had the slightest appearance of health in the countenance; and she, it was easy to see, owed it to her fortunate position

as general messenger to the whole, and to the exercise and free air this function procured her. All the rest were in a sort of etiolated condition—pale and wan from confinement, bad air, and worse food. The dress of the whole family, with the exception of that of the little messenger, who was kept in some show of decency for the sake of appearances, would not have sold for a penny above the rag price in Monmouth Street. Neither mother, nor daughter grown up to womanhood, seemed to have preserved a relic of that graceful sentiment of personal propriety, which is the last thing that the sex generally surrenders to the 'want which cometh like an armed man.' But here want was not the destroyer: a fiend of more hideous aspect and deadlier purpose held undisputed sway in this wretched abode of perverted industry and precocious intemperance. As I departed down the crazy stairs, I could not help compassionating the hapless mother, whom I thought it more than probable the hateful vice of intoxication had first oppressed, and then seduced. Her bloated countenance left no room for doubt as to the truth of her tyrant's assertion; but there remained on it yet the trace of former truthfulness and kindness, and the burning sense of shame attendant upon her present condition. On the coming doom of the family—the son, the daughter, the toiling children, the sleeping infant—it was too painful to reflect.

The Label Printer.—The next day, my friend's commission requiring it, I paid a visit to one of the same class in a different line of business. In one of the small courts leading out of Drury Lane I found this worthy, whose occupation was that of printing labels in gold letters upon coloured paper. Fortunately for the fair sex he was a bachelor, and being on the verge of fifty, was likely to continue so. All the implements of his art, and they were not few, together with his bed and his beehive-chair, were around him in a room a dozen feet square, and which he gaily styled the 'parlour next to the sky.' His press was a contrivance such as I had never seen before, economising both space and labour at the penalty—which he seemed to care little about—of abominably bad work: the pressure was produced by the action of a pedal near the floor under the machine, and consequently the labour of rolling in and rolling out, indispensable in the common printing-press, was avoided. When I entered, he was actually printing the word 'LONDON' upon half-a-dozen strips of polished azure paper, applying powdered gold, with a pencil of camel-hair, to the varnish or size used instead of ink, as each was impressed! Upon my pointing out the liberty he had taken with the orthography of the word, he seemed not to comprehend my meaning; and remarking that he never did nor could understand any of the hographies, seriously inquired what was wrong. Being at length made aware that another *o* was wanting (but not before he had made careful reference to a dog's-eared dictionary), he assumed a look of strange mortification and perplexity. It was not altogether that he was ashamed of his ignorance; of that the poor fellow had been too long conscious; it was rather that he could see no remedy in the present case. 'This, sir,' said he, 'is a *noosance*, and no mistake; that's my biggest fount, and there is but one alphabet of it beyond the vowels!' After a minute's consideration, however, and scratching of his grizzled pate, he brightened up, and went on with the affair as it was, with the consolatory declaration that they were no great scholars thereabout; that there were others no wiser than himself; and that the things were for people in the court, who would never find it out; to which he added, that 'if anybody had a right to spell a word as he chose, it was a printer short of types.' Somewhat tickled with the fellow's good-temper and accommodating philosophy, I sat down to wait for my friend's packet of labels, which he said only required taking out of the finishing-press to be ready for delivery. I learned from his conversation that he had served his time to a little bookseller and printer at a small town on the Welsh coast;

but he had spent most of the seven years in running about the town as circulating librarian, or waiting in the shop, and not as many months altogether in the office, where there was generally nothing to be done. Discharged of course at the end of his term, to make room for a new apprentice with a new premium, he had come to seek his fortune in London. After considerable difficulty and disappointment, he at length succeeded in obtaining an engagement in a large office. On taking possession of his 'frame,' he said he was at first so alarmed at the exploits of the numbers of clever and rapid workmen around him, that he had not the proper use of the few faculties he could boast, and could think of nothing but his own want of skill. This state of mind only made the matter worse. Nervous and excited, he endeavoured to make the same show of celerity as the others, and got through the first day in a state of complete bewilderment. The second and third passed off a little more to his satisfaction; and he was beginning to nourish some small degree of hope, when on the fourth day the first evidence of the value of his labour was put into his hands, in the form of a proof copy of his work, sent from one of the readers, whose office it is to mark the mistakes of the compositor, for the purpose of correction. Such a horrid amount of blunders he declared the world had never seen before at one view: to the sheet upon which the broad page was printed, the corrector had been compelled to join another, to afford space to mark the errors. 'Upon my soul, sir,' said he, 'I could not stand the sight of it; moreover, the man behind me was grinning over his frame, and telegraphing the whole room. I wished myself a thousand miles away; and seizing my hat and coat, bolted down the stairs as fast as I could run. I got a letter in a few days from the party who recommended me, desiring me to return and resume my work; but I could not do it. The face of that chap grinning over my shoulder has given me the nightmare fifty times. That's six-and-twenty years ago, and I have never been near the place since.' Sick of the printing, he had next tried to work as a bookbinder, which, as is usual in country towns, he had learned as well (or rather as ill) as the other; but here also he found himself equally at fault. Discharged from the bookbinder's, to make room for a more expert hand, he found himself cast upon the world with no available means of subsistence. Want of funds, speedily followed by want of food, drove him again to make application to the printing-offices; but now he avoided large houses, and was at length fortunate enough to locate himself in a suburban establishment of small pretensions, where he got board and lodging, and a nominal salary, doing what he could, for just what the proprietor, who was as poor almost as himself, could afford to give him. Here he stayed, on and off, as he said, for more than a dozen years, during which he contrived to add something to his knowledge of the business, and to save a few pounds, with which, on the demise of his employer, he purchased a part of the materials he had so long handled, and commenced printer in his own right. It appeared that the whole of his gains during all the years of his mastership had not averaged much above £40 a year, out of which he had to pay 3s. 6d. a week for the rent of his room. He showed me his stock of implements, consisting principally of solid brass blocks, engraved in relief for the purpose of gold labels attachable to the thousand-and-one wares of druggists, chemists, haberdashers, fancy stationers, and numberless other traders. The blocks were for the most part the property of his employers; and he found it his interest to keep a small stock of each on hand, to meet the demands of the proprietors. He attributed the blotchy impression which characterised all his work mainly to his rickety press, and sighed for a better, which he had yet no prospect of obtaining; but he observed that though his work would look very bad in ink, it was a very different thing in gold; that made even a blotch ornamental, and of which

people seldom complained of having too much for their money.

This poor fellow presented the most remarkable instance of unfitness for the business he followed that I ever met with. With huge, horny, unmanageable fingers, and defective vision, he pursued a craft, to the successful prosecution of which quick, keen sight, and manual dexterity are indispensable. Requiring a knowledge of at least so much grammar as is comprised in the arts of orthography and punctuation, he was profoundly ignorant of both. Thirty years of practice as a printer had not taught him to spell the commonest words in the language, as I became aware from certain cacographic despatches on business matters subsequently received from him. Honestest of bunglers! one-half of his painstaking existence was passed in repairing the blunders of the other; and yet it is a question whether he did not enjoy his being with as much relish as any man that ever lived. His cheerfulness was without a parallel in my experience: an inexhaustible spring of hilarity seemed welling from every feature. Nature had more than compensated him, by the bestowal of such a temperament, for all the sports of fortune. Proof against calamity, he grinned instinctively in the face of adverse circumstances; and once declared to me that he did not think any mortal thing could depress his animal spirits, unless it might be a drunken wife; whether such an appendage to his fortunes might succeed in doing so he couldn't say, but he had no intention of making the experiment.

He died the death one might almost have wished him, considering his solitary lot. He was found by an early visitor one morning dead in his beehive-chair, the newspaper in his hand, a half-smoked pipe broken at his feet, a pint of hardly-tasted ale on the hob of the empty grate, and the candle burnt out in the socket on the little table at his side.

INSTANCES OF MANUAL DEXTERITY IN MANUFACTURES.

THE 'body' of a hat (beaver) is generally made of one part of 'red' wool, three parts Saxony, and eight parts rabbits' fur. The mixing or working up of these materials is an operation which depends very much on the dexterity of the workman, and years of long practice are required to render a man proficient. The wool and fur are laid on a bench, first separately, and then together. The workman takes a machine somewhat like a large violin bow; this is suspended from the ceiling by the middle, a few inches above the bench. The workman, by means of a small piece of wood, causes the end of his 'bow' to vibrate quickly against the particles of wool and fur. This operation, continued for some time, effectually opens the clotted masses, and lays open all the fibres: these flying upwards by the action of the string, are, by the manual and wonderful dexterity of the workman, caught in their descent in a peculiar manner, and laid in a soft layer of equable thickness. This operation, apparently so simple and easy to be effected, is in reality very difficult, and only to be learned by constant practice.

The curved shell of metal buttons is prepared by means of a stamping-press; but instead of a punch, a curved polished surface is used. The workwomen employed to stamp the little bits of copper acquire such dexterity, that they frequently stamp twelve gross in an hour, or nearly thirty in a minute. This dexterity is truly wonderful, when it is considered that each bit of copper is put into the die separately, to be stamped with a press moved by the hand, and finally removed from the die. The quickness with which the hands and fingers must be moved to do 1728 in the hour must be very great.

In type-founding, when the melted metal has been poured into the mould, the workman, by a peculiar turn of his hand, or rather jerk, causes the metal to be shaken into all the minute interstices of the mould.

In manufacturing imitative pearls, the glass bead forming the pearl has two holes in its exterior; the liquid, made from a pearl-like powder, is inserted into the hollow of the bead by a tube, and by a peculiar twist of the hand, the single drop introduced is caused to spread itself over the

whole surface of the interior, without any superfluity or deficiency being occasioned.

In waxing the corks of blacking-bottles much cleverness is displayed. The wax is melted in an open dish, and without brush, ladle, or other appliance, the workman waxes each cork neatly and expeditiously simply by turning the bottle upside down, and dipping the cork into the melted wax. Practice has enabled the men to do this so neatly, that scarcely any wax is allowed to touch the bottle. Again, to turn the bottle to its proper position, without spilling any of the wax, is apparently an exceedingly simple matter; but it is only by a peculiar movement of the wrist and hand, impossible to describe, and difficult to imitate, that it is properly effected. One man can seal one hundred dozen in an hour!

In pasting and affixing the labels on the blacking-bottles much dexterity is also displayed. As one man can paste as many labels as two can affix, groups of three are employed in this department. In pasting, the dexterity is shown by the final touch of the brush, which jerks the label off the heap, and which is caught in the left hand of the workman, and laid aside. This is done so rapidly, that the threefold operation of pasting, jerking, and laying aside is repeated no less than two thousand times in an hour. The affixing of the labels is a very neat and dexterous operation; to the watchful spectator the bottle is scarcely taken up in the hand ere it is set down labelled. In packing the bottles into casks much neatness is displayed.

The heads of certain kinds of pins are formed by a coil or two of fine wire placed at one end. This is cut off from a long coil fixed in a lathe; the workman cuts off one or two turns of the coil, guided entirely by his eye; and such is the manual dexterity displayed in the operation, that a workman will cut off 20,000 or 30,000 heads without making a single mistake as to the number of turns in each. An expert workman can fasten on from 10,000 to 15,000 of these heads in a day.

The reader will frequently have seen the papers in which pins are *stuck* for the convenience of sale: children can paper from 30,000 to 40,000 in a day, although each pin involves a separate and distinct operation!

The pointing of pins and needles is done solely by hand. The workman holds thirty or forty pin-lengths in his hand, spread out like a fan; and wonderful dexterity is shown in bringing each part to the stone, and presenting every point of its circumference to its grinding action.

In stamping the grooves in the heads of needles, the operative can finish 8000 needles in an hour, although he has to adjust each separate wire at every blow. In punching the eye-holes of needles by hand, children, who are the operators, acquire such dexterity, as to be able to punch one human hair and thread it with another, for the amusement of visitors!

In finally 'papering' needles for sale, the females employed can count and paper 3000 in an hour!

FACTORY EDUCATION IN LANCASHIRE.

The following is an extract from the recent report of Leonard Horner, Esq. inspector of factories:—'It has been often said that the attempt to educate the children proposed by the factory acts has been a failure: it is only so when good schools are not within reach; where there are good schools, not only do the parents of children and the owners and managers of factories, with comparatively few exceptions, willingly send them, but the children make good progress: their three hours' daily attendance, from eight to thirteen years of age, is found sufficient to give them a very considerable amount of instruction, and I have visited schools where some of the half-time children have been amongst the best scholars. Thus in a late visit to a British School at Lees, near Oldham, established mainly by the exertions of Mr William Halliwell and Mr Atherton, owners of mills there, and admirably taught by an able and zealous master, Mr Atkins, I heard a large class of factory children go through an excellent examination in English history, geography, and on the cotton plant, its properties and applications; the chief monitor and examiner being a factory half-timer of twelve years of age. I found in the same manufacturing town similar proofs of factory children making good progress, in another well-taught school established by the Moravians there, and conducted on the plan of the British School by an intelligent master trained at the Borough Road School.'—*Manchester Examiner*, June 27, 1848.

TO THE SNOWDROP.

FULL oft the poet has essayed to sing
Thy merits, simple flower; nor quite in vain.
Yet not to thee may I devote the strain
Of eulogy; but to that glorious King,
Who bids thy silver bell his praises ring,
And doth thy leaves so delicately vein;
Making thee meek and modest through thy mien,
The darling of the progeny of spring.
Ay! many a brighter flower the vernal gale
Will kiss, but none to which affection clings
As unto thee; who, as the strong sun flings
His brightness on thee, dost so meekly veil
Thy face: as at the Light celestials hail,
The seraphim theirs cover with their wings.

ROMANTICISTS.

It may not be altogether superfluous to explain what Strauss and the Germans mean by a Romanticist (*Romantiker*). The Romanticist is one who, in literature, in the arts, in religion, or in politics, endeavours to revive the dead past; one who refuses to accept the fiat of history; refuses to acknowledge that the past is past, that it has grown old and obsolete; one who regards the present age as in a state of chronic malady, curable only by a reproduction of some distant age, of which the present is not the child, but the abortion. Poets, who see poetry only in the Middle Ages, who look upon fairy tales and legends as treasures of the deepest wisdom; painters, who can see nothing pictorial in the world around them; theologians, who can see no recognition of the Unspeakable except in superstition, who acknowledge no form of worship but the ceremonies of the early church; politicians, who would bring back 'merrie England' into our own sad times by means of ancient pastimes and white waistcoats—these are all Romanticists. It is quite clear that, however modern the name, the Romanticist is not a new phenomenon. There have ever been—will ever be—men who, escaping from our baffling struggle with the Present, dream of a splendid Future, where circumstance is plastic to their theories, or turn themselves lovingly towards the Past, in whose darkness they discern some streaks of light, made all the more brilliant from the contrast—this light being to them the only beacon by which to steer. Antiquity had its Utopians and Romanticists, as we have our Humanitarians and Puseyites.—*Edinburgh Review*.

WHAT LONDON IS.

London, which extends its intellectual if not its topographical identity from Bethnal Green to Turnham Green (ten miles), from Kentish Town to Brixton (seven miles), whose houses are said to number upwards of 200,000, and to occupy twenty square miles of ground, has a population of not less than 2,000,000 of souls. Its leviathan body is composed of nearly 10,000 streets, lanes, alleys, squares, places, terraces, &c. It consumes upwards of 4,363,000 pounds of animal food weekly, which is washed down by 1,400,000 barrels of beer annually, exclusive of other liquids. Its rental is at least £7,000,000 a year, and it pays for luxuries it imports at least £12,000,000 a year duty alone. It has 537 churches, 207 dissenting places of worship, upwards of 5000 public-houses, and 16 theatres.—*Newspaper paragraph*.

THE MORAL REGENERATOR.

He will need much patience, much forbearance, much Christian love, and the charity that 'hopeth all things,' that hopeth when there seems every reason to despair. He must proceed, like the Vicar of Wakefield in his prison, fortified by hope alone. There is always room for hope: the profligate ruffian is often nearest relenting when he seems most brutal; he is then, it may be, only endeavouring to harden himself against what he considers a rising weakness; and a little more perseverance, another word in season, may complete the conquest, in spite of the struggles of his worse nature.—*Haygarth's Busk Life*.

HUMAN HYDROPHOBIA.

ONE could almost suppose that hydrophobia, in a certain modified form, was an endemic in human society as well as amongst dogs. The lower portions of the community, in particular, seem to consider themselves as having a prescriptive right to suffer from it. The diagnosis of the malady in the human patient does not point to a catastrophe altogether so abrupt and tragical as in the canine, but it is attended by circumstances quite as sinister. Dirty faces, dirty clothes, dirty houses, dirt all over, are the symptoms which most forcibly arrest attention; and yet bad as these are, we know that there are worse effects underneath the surface, for where physical dirt goes, there also resides moral degradation.

We know no country of Europe where there is so little disposition on the part of the people, as in ours, to give themselves even that exhilarating kind of ablution which is derived from bathing. At the present season, the traveller on the continent finds the rivers alive with swimmers; and we remember, when sailing down the Loire to Nantes, observing the steamer frequently surrounded, more especially when nearing the great manufacturing city, with crowds of black heads and white shoulders. In Russia, where the people have not got beyond the middle ages, the lower classes do not yet know the use of a shirt, but wear it above their trousers in the form of a kilt. They have not, however, abandoned the bath. Towards the end of the week, they feel a prickly and uncomfortable sensation in their skin, and at length rush eagerly into the hot steam, and boiling out the impurities of the preceding six days, begin life again with new vigour. In summer, they do not wait for days and times, but merely get up an hour earlier, and dash into the nearest pond or river. In our refined country, dirt causes no uneasiness. It is allowed to harden upon the skin, choke up the pores, and contaminate the whole being, moral and physical. It blunts the senses to such a degree, that the husband does not detect it in the wife, nor the mother in the child. All are alike. All have forfeited the dignity of human nature, and sunk into a lower scale of animal existence.

While mentioning the custom that prevails in Russia, we are struck with the proof afforded there of the connection between moral and physical cleanliness. The state of the bath-house of the hamlet is an unfailing index to the character and position of the inhabitants. If it is neat and trim, the people are good and happy, and their feudal lord kind and considerate; if poor and ruinous, there is tyranny on the one hand, misery on the other, and depravity on both.

In respect of its contagiousness, or inclination to spread, the human malady seems not a bit behind the

canine, although certainly the immediate symptoms are less virulent. It has been implied that the stain of dirt extends from the skin of the individual over his life and conversation. But it does more than that: it contaminates his family; it daubs his neighbours; it forms a nucleus round which impurity gathers, and strengthens, and spreads. Insignificant at first in itself, it becomes a social evil of importance. It is one of the units which gives its character to the aggregate; and, rising out of a thing which at first was only scorned from good taste, shunned from individual repugnance, or laughed at out of sheer folly, we see spreading over the land vice, misery, pestilence, and death. Yet we observe the symptoms of this formidable disease with a glassy and indifferent eye, while those of canine hydrophobia inspire us with horror and alarm, and drive us to dog-murder in self-defence!

The dread of water is seen in the human subject in another form, in which it is attended by a different class of effects—different, but not very unremotely allied to the preceding. Almost everywhere the use of water as a beverage appears to be felt as a sort of original doom, designed as a penalty for the sins of mankind; and everywhere are efforts made to disguise it in some way, so that the patient may believe he is swallowing something else. Much ingenuity has been expended upon this curious process; but in certain conditions of society, it seems to be of little consequence what taste is superadded, or by what means the super-addition is made. The grand thing is *transmogrification*. Amongst the poorer classes in China, a decoction of cabbage leaves is felt as a relief: amongst the upper, the tincture of the more elegant tea-leaf is employed. In the western world, the refuse of fruit and grain, subjected to fermentation and distilling, is brought into requisition. The Norman converts his good cider into execrable brandy; the other French maltreat their wine in a similar way; in Russia, the sickening quass becomes the maddening votki; in Scotland, honest twopenny is sublimated into whisky; and so on throughout the whole habitable world. That this sort of hydrophobia is merely a modification of the other, is established by the fact, that they who most abhor water as a cleanser, abhor it most as a drink. A cleanly person will frequently condescend to take a draught of pure element with his meals; but you never saw a man with a dirty face who would not greatly prefer some poisonous and ill-tasted compound. At the tables of the upper classes you find the water-karaff most in demand; at those of the lower classes the beer-jug. The quality of the beer is of no consequence. We never knew it so freely drank in our own neighbourhood as at a time (some twenty years ago) when the sole effect of the worthy brewer's manufacture was declared to be to *spoil the water*. Even amongst the abstainers from these

deleterious liquors, there are many who must still have their water disguised: hence their extensive patronage of lemonade, ginger-beer, and other weak though comparatively innocuous mixtures. The whole affair reminds us of a literary work published in London nearly twenty years ago by a Bond Street hairdresser, which gave a sort of catalogue *résumé* of the various materials used for lathering the beard—all except one; for the magnanimous barber scorned to mention—soap.

The connection between the worst symptoms of the two kinds of hydrophobia we have described needs little illustration. The dirtier an individual is in his person, family, house, neighbourhood, the more pestilent are the expedients he falls upon for disguising the taste of the abhorred water. In other words, the progress of the disease is naturally exhibited in the intensity of its symptoms. A man of sublime cleanliness may be found drinking pure water; with a little taint of human weakness one may indulge, likewise, but only occasionally, and in moderation, in beer, ale, wine, or even stronger brewings; while your true hydrophobist—a dingy, vulgar desperado, whom the very children on the street know and detect even when he happens to be sober—stupifies himself habitually with the worst form of alcohol. Does it not appear that there is an unjust distinction made in our treatment of human and canine patients? We do not propose that the former should be hooted and hunted like the latter out of society, or that they should be mauled with sticks and stones, or shot, poisoned, hanged, or drowned. They might not like it. It might cause some discontent. It would perhaps be better to let it alone, and try to manage some other way. But what other way? How would a pump answer at the end of every street, to be worked by the police? A passer-by, caught in the fact of hydrophobia, whether the dirty or drunken form of the disease, might be pounced upon, and put under the spout, when the remedy administered might be proportioned to the intensity of the malady. To say that this would be an infringement of the liberty of the subject is nonsense; for if society has not the right to repress a contagious disease by any means in its power, we might as well lay aside the habits of civilisation at once, and betake ourselves again to woods and caves. Peter the Great was the ablest doctor in the world, and it would not be amiss if we were to take a lesson from his school. The grand obstacle in the way of his project for civilising Russia was the beards of the nobles. To expect to teach European refinement to a man with a great, matted, beastly beard, was out of the question; and he tried by every Delilah-like stratagem he could think of to shear off the strength of barbarism. All would not do; and Peter had then recourse to a *coup d'état*. He sent against the malcontents an army of barbers, who rushed in upon them in their native woods, shaved their beards by main force,

‘And dragged the struggling savage into day.’

That some such plan as this may in time be tried, seems probable from the fact, that the sister-malady, Ignorance, is already treated by compulsory remedies. When a dirty little ragged boy is seen on the streets in some of our more civilised towns, he is picked up by the authorities and sent to school. He should in like manner be sent to the pump; and this, you may depend upon it, would be a great assistance in his education. When offenders are locked up in jail, the first process they have to submit to is that of being well washed and scrubbed. This is all very proper; but

surely it is an absurdity to show greater solicitude for the health of jails than for the health of dwelling-houses. If the men had been washed in time, we question much whether they would have become felons at all.

THE WEST INDIAN PLANTER.

A SKETCH FROM LIFE.

In taking a view of our own misfortunes, or of those of our neighbours, we are too apt to attribute to ill-luck that which is only the natural consequence of the sufferer's own failings. Extravagance, carelessness, weakness of character and purpose, perhaps an accidental oversight, ignorance of the world, or a want of that prudence which should prevent us from too hastily embarking in enterprises for which we are not prepared either by study or experience—one or all of these may generally be found at the bottom of every failure, if we do but give ourselves the time to examine.

A remarkable instance of this came under my notice during my residence in the West Indies. So invariably unsuccessful was my subject throughout all his undertakings, that he acquired the name of ‘The Bewitched;’ and the more simple inhabitants, considering his misfortunes as brought about by supernatural agency, did not even scruple to insinuate that he must have first made, and afterwards broken, a compact with the Evil One, who, for revenge, had set a blight upon everything he touched. Yet few individuals have ever started in life under circumstances more favourable to success than Fred Hamilton. Adopted by a bachelor uncle, who had been nominated to the governorship of the island in which I resided, in the days of highest colonial prosperity, he was called upon to act as secretary at the early age of sixteen. His education was defective; but for the colonies, this was of little importance while other qualifications existed; and our hero was persevering, adventurous, industrious, and saving even to parsimony, while the steadiness of his character was proverbial. He was not twenty when he thought he had laid by sufficient to embark as planter; and it just happened about this time that there was a fine plantation for sale, whose owner had returned to England with an immense fortune; and so rich was the soil, so well cultivated and well managed, that it was reported to yield from 50 to 100 per cent. The estate itself was invested with a great deal of romance and interest in the eyes of the inhabitants. It had been first planted by a certain Count Lopinot, a refugee from St Domingo, who would have been sacrificed during the rebellion but for the fidelity of his own domestics, who not only saved him from the fury of the insurgents, but followed him to this colony, there to continue as his slaves, and labour for his fortune. Count Lopinot, when he died, might at least have left the gift of freedom in his will to his generous deliverers; but such notions never occur to planters, or when they do, they soon give place to a weightier consideration for their heirs; and thus no other token of acknowledgment was ever given to these devoted negroes than in naming the estate, which the count called ‘La Reconnaissance,’ in remembrance of what he owed them. The negroes who survived him preserved a strong attachment to his memory. He had been invariably kind and indulgent to them, sharing in their labour, their hardships, and their fare; and the contrast he formed to the hard-tasking, unfeeling owner who succeeded him, only made them cling with greater fondness to his name. The old ones left his memory as an heirloom to the young; the new generation grew up with his name on their lips; and every year, on the anniversary of his death, the negroes would assemble with their children on his grave; and at sundown, the hour of his burial, they would sing the wild chorus of grief, and fling garlands of flowers on the spot where he slept.

It was of this estate Fred now became purchaser, having agreed to pay half the value down, and the rest in yearly instalments. He was delighted with his acquisition, which presented at crop-time a scene of stirring interest. Bands of young men and girls coming in to the mill laden with canes, and laughing with joy; groups of women watching and directing the process of grinding; and round about the caldrons, in the boiling-house, intelligent negroes, all busy and active in the manufacture, and cheering one another with their wild chorus songs, their stories, and their jokes. All went on well for a short time; the negroes were laborious and faithful, the estate well stocked, and sugar so profitable in the market, that Fred looked forward to a return which would not only pay off the first instalment of the debt incurred by the purchase, but be sufficient to realise a handsome surplus beside. As he was indulging in these reflections, planning his future movements, and picturing to himself a brilliant fortune, home intelligence arrived announcing a fall in the sugar market so great, that not enough could be realised to meet the debt of the estate. Fred was startled, but not discouraged, for he had not been wholly unprepared for the fluctuations of the West India market, which at times were so great as to give to planting something of the character of gambling. Yet an error had been committed in the time chosen for the speculation—an error which wiser heads than his committed, when in their commercial adventures they take not into consideration the onward march of social and political changes, and their necessary influence on the private affairs of men. The question of the emancipation of the slaves, so often discussed, and so often set aside, was at last beginning to gain ground in England. But the colonists would not believe this, though they saw the markets steadily suffering; and our hero had been as obstinately blind to the fact as the rest when he had ventured as a slave-holding planter.

His first difficulty had come upon him, and the fall in the sugar market was afterwards related as a fatality connected with him, particularly when it was remembered that, to add to his perplexities, Sir James—now suddenly fell ill, and died a victim to the effects of the climate. This was a terrible blow to the young colonist, who lost in his uncle not only his best friend, but all hope of future favour with the men of power in England. Even the fortune he was led to expect was found legacied to poor relatives, Fred being considered too favourably embarked in life to need more than a family keepsake. To add to his mortification, he soon had to resign to another governor not only the government villa he had been accustomed to inhabit, but to a young successor the office of secretary, which had hitherto given him dignity and income.

Thus circumstanced, Fred prudently resolved to go down to live among his slaves on the estate. His first care was to reduce the expenditure: he dismissed his manager, and in his place worked early and late, in order to turn everything to profit, and prevent unnecessary waste. With this, he was prudent enough never to lose sight of the physical welfare of his negroes; and I even remember meeting him in a shop about this time clad, as I thought, very shabbily, while he was purchasing good warm clothing for his slaves. But neither economy nor good management could prevail against the commercial depression of the times. The markets became worse and worse; all West India produce was now at a discount; and the price of sugar continued steadily to sink, till the planters, alarmed and disconcerted, and being unable any longer to bear the expenses of a manufacture at all times very heavy, tore up their canes, and laid out their lands for other produce.

Fred alone bore the pressure with patience, believing that sugar was too long down not to rise at last. He still struggled on through his difficulties to maintain the expense of sugar-planting. By way of helping himself to do so, he resolved to embark what money he

had on hand in some channel of profit; and finding a great demand in the market for cattle, an epidemic having swept the island of domestic animals, he took the opportunity, when a ship was about to sail for the coast of Africa, to order a cargo of bison from the banks of the Senegal. In a few weeks the ship returned; and so eagerly were the animals sought by purchasers, that it was calculated Fred Hamilton might have made upwards of £2000 profit that morning had he been disposed to come to terms; but after some bargaining, he postponed the sale, and sent his bison away to the savannas to be refreshed by green food, thinking that it would improve their appearance, and thus enable him to derive a greater profit from them. And it really seemed to turn out as he expected; the few he had sold to form samples of butchers'-meat had been so much approved (the hump on the back had been found particularly tender), that many customers showed signs of meeting the extravagant demands of the young speculator, and volunteered to follow him to the place where the animals were grazing. But a very different scene to that which they expected now met their view. Full twenty head of cattle were lying dead on the ground, all swollen and disfigured, from the effects of poison, while those which remained alive, were drooping and dying. Was it the deed of some hidden enemy—some revengeful slave? No: but Fred Hamilton, in sending the animals to the savannas, had never paused to consider their physical circumstances. Pent up and starved during the voyage, and proportionably eager to satisfy their hunger when the means were at hand, they had lost that instinct which should have taught them to distinguish between different herbs, and consequently had fallen victims to the poisonous weeds with which the new soil abounded.

The next speculation in which we find our hero engaged is matrimony; for he now considered the possession of an heiress the fairest and easiest way of rising out of his increasing difficulties.

Nora Grantley was at this time decidedly the belle of the colony. But her large lustrous eyes and fringing lashes, and her rich brown locks inframing a complexion fair as the rose, were not her only charms; she had a mind simple as it was accomplished, and a heart warm as youth, innocence, and native goodness could make it. Better than all in the eyes of our colonist, she had a fortune, the amount of which was perfectly well known to Fred, as it was lodged in his brother's bank in England. It was precisely what he wanted—not investments of any kind, but hard cash at the disposal of the lady herself. Fred became painfully impatient to seize a prize apparently within his reach; and with anxious steps he hastened to make acquaintance with Major Grantley, the father of the young lady. Nora proved agreeable to the suit, the father encouraged it, and Fred was at length received as an acknowledged suitor. It had been well for Nora, however, had Fred never thought of her.

From the time of his uncle's death, Fred had become careless and imprudent in the choice of his companions, merely from a love of that flattery which, in the days of his uncle's power, had been profusely offered to him, and which he could no longer obtain but from those of a lower grade. Among the sycophants and parasites who were always about him, there was none so distinguished as George Morven—a young man of indifferent character, but possessing the seductive qualities of wit and a handsome person. He had missed Fred of late in their joyous haunts, and determined to learn the cause, he set off for La Reconnaissance, and soon overtook his friend, bent on the same journey. They spent the night in revelling, and when morning came, the negroes found the two gentlemen asleep in the open air, in a state which plainly told of their excesses. Now, the dew, or, as some have it, the moonlight, of tropical climates has generally a fatal effect upon those who sleep exposed to its influence, and Fred awoke ill, and with the muscles of

his face drawn completely awry. In the delirium of fever he raved continually about Nora, and about a little antelope brought to him by the captain of the bison cargo, and which, it seemed, during his last interview with Nora, he had promised to present to her next day. Morven, who, to do him justice, nursed his friend during his illness with brotherly care, renewed the conversation one day when he found the patient recovering, and offered to take the little creature to town with intelligence of his health to the lady, shrewdly remarking that it would keep him fresh in her memory. This offer was readily accepted, and many a message went and came from that day between Major Grantley's domicile and La Reconnaissance, until George Morven professed himself obliged to leave him to see after some affairs of his own in town. Being now left alone, Fred scarcely waited for the doctor's leave when he mounted his horse, and rode to town to see his Nora. The evening was bright and beautiful, and the road was lined with gay and fragrant blossoms; glittering birds twittered merrily on the boughs; and broad-winged butterflies were robbing the bells of the cactus, or sporting unconcernedly along, now alighting on the horse's neck, now dancing before our traveller's steps, as in joyous token of his coming bliss. Yielding to the pleasing influence, Fred mused on his future destiny, and the object which was to brighten it; and recollecting the taste which Nora had for binding her tresses with wild-grown wreaths, he tore from the palms the blooming garlands which twine about their trunks, and quickening his pace, arrived soon after at Major Grantley's by the courtyard gate, as it was customary with visitors riding. The first object he noticed was the antelope, which came bounding towards him, presenting her slender neck for the garlands which her master flung about her. Followed by the little favourite, he entered the house: but where was Nora? Alas! the place was desolate! Not a creature was to be seen, save one female domestic, who was standing at the door looking mournfully down the street. It was from this poor negro woman that Fred now learned the cause of the desolation around. Nora, the idol of so many, the good, the beautiful, the accomplished, had eloped with Morven, and the old major had left the house distracted to seek his child.

Some years afterwards I chanced to see Nora. Alas, how changed! She, the hard-working drudge, by turns cooking a scanty meal for her drunken husband, and scouring the floor, I could scarcely at first believe her to be the same with the beautiful heiress, reared with such lavish affection and tenderness! Her father? Alas! he had long sunk into the grave: and her fortune—it was gone! But to return to the disappointed lover. He, it is said, was so overpowered at the unexpected account, that he fell senseless on the floor. Much pity cannot in justice be accorded to him. A true lover would not have become a night reveller; a true lover would have shrunk from trusting to the mediation of an unprincipled boon companion. A suitor from unworthy motives, he only met his proper reward. The unhappy Frederick suffered a relapse from excess of grief; but he was soon abroad again, and actively looking about for some other means of improving his fortune. Indeed it was eminently required. The sugar had sunk more and more with every season; the planters no longer gave way to alarm; they were past that—they desponded; and Fred was fain at last to follow the general example, by rooting up the canes, to give place to some other produce. He now divided his estate between the planting of coffee and cocoa, at that time the two most profitable articles in the West India market; and so well did he manage, that it was not long before the precious plants began to flourish. But alas for his expectations, which had still outlived the signal failures of the past! One morning during his rambles among the cocoa walks, to his dismay he discovered all the buds to be devoured by caterpillars of an enormous size, which swarmed in such extra-

ordinary numbers as even to amaze the negroes themselves, accustomed as they are to tropical plagues. The coffee, too, was a failure; shrivelled and imperfect, the berries proved all valueless.

Amazed at a calamity which, of all the planters of that quarter, seemed to touch him alone, our colonist began to consider himself as the victim of his own negroes. He assembled them forthwith, examined them, accused them of dealing in Obeah magic, and punished them as though he had proved the crime. Yet what, in reality, was the cause? He had changed the cultivation of his estate from a kind which his negroes understood, to one of which both master and slaves were equally ignorant. From false notions of economy, he had not even allowed himself the assistance of a manager; and when the season came for clearing the leaves of insects, the cocoa bushes were ignorantly neglected, and consequently devoured before the time of harvest came round. As for the coffee, its cultivation proved a failure, because the site of La Reconnaissance was by no means adapted for its growth; a circumstance which Fred Hamilton had entirely overlooked. Thus still was misfortune traceable to some deficiency on his own part.

Having little to occupy him for a time, Fred began to collect all the fallen timber on the estate, which he was so far successful in selling, that the proceeds enabled him to embark in a speculation of another kind. He purchased a piece of land just outside the town, on the borders of a pleasant savanna, where the broad tufts of the bamboo and sheltering cinnamon make the air cool and fragrant. On this he erected a villa. The house was handsome, the garden, too, was charming. It had a Grenadilla arbour, patches of Spanish rose, and shrubs of the much-prized Irish brier, which scents the air with its leaves, though it refuses to bloom in the tropics. Then mimosas in abundance, trumpet and wax flowers, and a hundred others which he took care to introduce, to say nothing of a precious corner laid out for European vegetables, and which alone was enough to make the place desirable. He was not long in meeting with an advantageous offer for its purchase; and he was about to close the agreement, when a claimant most unexpectedly started up to dispute the title, which Fred had unfortunately neglected duly to examine. As matters stood, he might even then have extricated himself from the dilemma, had he listened to the counsels of a friend, who advised him to compound, and submit the matter to private arbitration, rather than engage in a suit; but Fred was tenacious, and would not yield an iota of what he held. So did the suit begin; and it may be pending yet for anything I know.

To meet the demands of the men of law, Fred found himself obliged to sell some of his negroes. He perceived with satisfaction that the slave market was rising. There happened to be in the harbour a ship recently arrived from Barbadoes with a cargo of slaves smuggled from that island; and Fred, calculating on the favour which the government officers were testifying to the captain, ventured on the purchase of a lot, which he intended to take down to the estate, feed into proper plight, and sell again at a profit. And so far he had succeeded in his plans, that they were already trained and managed to excellent condition for the market, when one morning, as he sat calculating his probable gains on their sale, a strange negro entered his hall and presented him a paper, an official despatch, proclaiming the Barbadian cargo free.

How such an inconsistency could take place, can only be explained by that partial administration so usual in colonies far from the controlling power of the mother country. The smuggling vessel had not only been allowed to enter the harbour unopposed, but the custom-house officers had passed the cargo, the registrar had entered the names of the negroes in his record, and even the protector of slaves had given the necessary license for their sale. But a private quarrel having arisen soon after between the latter gentleman and one of the pur-

chasers, for revenge, an inquiry was immediately instituted into the illegal proceedings of the late importation, in order that the protector's opponent should be summoned to pay the penalty of the offence. Suffice it to say, that more opposition was offered to the sentence than had been contemplated; public curiosity was roused, and the punishment intended only for one, was soon found necessary to extend to all those who had been engaged in the forbidden purchase. Remonstrance was vain—petitions were useless—the authorities had frowned; and even Fred, who hastened to town to solicit connivance, was forced to submit. Alas! he had bought those slaves on credit; his debts had already increased to such an amount that he began to despair in good earnest; and what was worse, with the loss of hope vanished much of that nice sense of honour and self-respect of which he had once enjoyed the reputation. Purchasers of the smuggled cargo attributed their losses to his unfortunate partnership in the concern, and reported their conviction to all the gossips of the place. His dealings were mistrusted, his rectitude questioned—nay, his very payments were looked upon with superstitious dislike. Women would sit in their balconies of a moonlight evening and relate long tales of his quarrels with the Evil One—how his new house was haunted, his cattle poisoned, his possessions cursed; and it was even asserted that winged demons had been seen flitting about his head as he was riding home one night in the gloom. At last even poor Fred's friends began to shun him—the weak, because they could not rise superior to public opinion; and the selfish, because he no longer brought them interest or honour.

Forsaken by all, Fred Hamilton was glad to turn to one who, being a despised man, and of the outcast race of mulattoes, he judged would only be too glad to have the honour of befriending him, a white man. Sam Bruton, flattered by his notice, showed himself willing to serve the planter; he lent him money in his distress, and daily transacted little matters to his advantage, which, owing to general prejudice, would otherwise have been neglected. Fred thought little of these things. Like all white people, he considered the coloured race born for his benefit, deeming it recompense enough to permit any service at their hands. And when he saw Bruton's sister, it was not love that drew his attention, but the hope of obtaining a female superintendent on the estate to tend the negro children, and visit the patients of the hospital. But Lolotte was beautiful: she had one of those houri-like southern faces which set one dreaming of Paradise. And modest she was withal, and humble in her demeanour, as became one of her rejected race. Hamilton became fascinated; and almost unconsciously he made use of expressions which gave the poor girl to suppose that she had conquered the prejudices of caste. The brother was frantic when he found he was only trifling with his sister's happiness.

It would have been easy to stop this annoyance in former days, when a white man might with impunity have inflicted Lynch law on a refractory mulatto; but the times were altered now—things were in a state of transition; scarcely any one knew his ground. The mulattoes had grown arrogant through government favour; and the planters, too well aware of this, shrank from quarrels, which, in the issue, would only humble them before a race of people they had hitherto trampled upon with impunity. Fred, therefore, saw the expediency of temporising, and with well-feigned candour he showed his books to the young coloured man, and explained the difficulty of his affairs. 'You see,' he said, 'I am on the brink of ruin—my only hope lies in the willingness of my relatives in England to help me; and you will understand the impolicy of displeasing them just at this moment by a marriage which they would never forgive: only wait a little till I can do it with impunity.' Bruton yielded, but he watched him night and day; and he soon found that Fred, whether disgusted with his own importunities, or advised by his friends,

was actually negotiating for a commission in the army, and preparing for a final and clandestine departure from the island. I remember one evening taking a stroll in company with some friends to Bruton's hut to see Lolotte, now broken-hearted and forsaken; for the little family, so well conducted and knit together with affection, had excited universal interest even among the race whose privilege it was to despise them. We found Lolotte reclining on a couch, with a rosary on the back of a chair near her, and a prayer-book on the seat. Her cheeks were sunken and haggard; her complexion, once so soft and golden, was now of an ashy paleness; and her large eyes shone with a light almost unearthly. She was hardly able to speak from exhaustion; yet when we rose to depart, on one of our party casting her eyes upon the prayer-book with a smile of approval, she made an effort to whisper, while her eyes filled with tears, 'It was for him I was praying: should you see him, say that Lolotte forgives him, and poor Bruton too has promised to forbear.' . . . She could say no more, and we hurried away, secretly rejoicing to feel that her sorrows would soon be at an end. Nor were we mistaken, for in a few days afterwards we caught a sight of Bruton passing our house clad in mourning. He was graver than usual; but his countenance was also calmer and more resigned. We knew then that it was all over; and a very little after, we heard of Fred as busily as ever engaged in studying tropical agriculture, from which we judged that he had given up his commission, and had once more settled down to his wonted interest and occupations on the estate.

Bruton, in the meantime, had not forgotten his sister's wrongs, and in his desire for revenge, had been plotting the final ruin of her destroyer. Aware of the state of Fred Hamilton's affairs, he had written a full account of them to Coleman, former proprietor of La Reconnaissance, and principal creditor of its present owner, than which a more effectual means of sinking his enemy could not be devised. And now that the estate was thriving, our planter's experience telling, and the harvest really ripening, Coleman, who for some years past had been unable to obtain his due instalments, arrived to claim the estate in person. And to complete the last link of Fred's misfortunes, no sooner were the forms of seizure complied with, than the general emancipation of slaves was proclaimed; so that, after all, Fred had not even the right to claim a shilling of the compensation money allowed to the slave-owners. The day on which he resigned La Reconnaissance, he borrowed a wagon to convey his movables to town, directing them to a hotel; while, with sorrow at his heart, he went by a bypath to take a last look at the estate. Strange that the same man who had but lately made such strenuous efforts to abandon the spot, should now feel such difficulty in summoning up resolution to leave it. He wandered up and down the walks he had planted like one in a dream, here pausing to contemplate the well-laden shrubs of cocoa, there turning to listen to the gurgling stream which watered them, or rushing senselessly through the tufts of Indian flag and tangled lianas which partly concealed the banks. So he continued till night came, and then he lay down beneath the tall coral-trees and slept till next mid-day, when, by mere chance, one of the negro women of the estate found him still on the ground, and burning with fever. With the help of a companion whom she called to her assistance, she carried him to her hut, where, with that instinctive kindness characteristic of the African, she tended him night and day, placing all her little gains and possessions at his command. But the hand of sorrow had pressed too heavily on his head, misfortune after misfortune had crushed his spirit, and he looked at the future with despair. Thus without a friend, without a home, without a hope on earth, received for charity into the hut of one of his own negroes, did the nephew of his Excellency the Governor of —, the brilliant secretary of 182—, the fortunate purchaser

of La Reconnaissance, now at the age of twenty-eight, sink broken-hearted into the grave.

Alas! how many an adventurer has gone forth like him, full of ambition, elated with hope, impatient of gain, and ended as he did, without a friend to close his eyes! A mournful lesson to those who feel inclined to leave the slow certainty of home advancement to pursue the brilliant phantom of 'El Dorado!' ♦

A too great love of gain, to the exclusion of every other thought and feeling, seems to have been our planter's defect. He might have succeeded in more settled countries; but here, the current of events was stronger than he could stem, and he had not genius to humour the stream till he could safely and conveniently swim to the shore.

As a relief to the melancholy catastrophe, we have pleasure in stating that those negroes who had been sold away from La Reconnaissance, sharing in the general boon of emancipation, were soon enabled to return to their old friends and relations; and we have since heard that many of them have even become small proprietors on that spot of land they had so richly deserved to inherit.

IMPORTANCE OF THE INSIGNIFICANT.

It is one of the marvellous arrangements of Providence, that results of the greatest magnitude and importance are not unusually caused by operations apparently so insignificant as to be reckoned scarcely worthy of notice. Nothing, however, is really insignificant—all has a meaning—all tends to one harmonious whole in the order of creation.

Some beautiful illustrations of this proposition are to be found in the animal kingdom, particularly in the immense and wonderful influence of minute animated organisms upon the actual form and mass of the globe! The chalk formation fills every reflective mind with wonder. The chalk-beds of England are many hundred feet thick, and many miles in extent. Who raised this wall of white around our coast? Who piled up those precipitous masses, from which all the labour and skill of man can only detach a few comparatively insignificant morsels? 'We did!' utter a myriad-million animalcules, whose dead bodies we thus behold. It is beyond conception; but the microscope assures us of the fact. These vast beds are composed of the shells of infusory animalcules. A 'line' is the 12th part of an inch. Now these creatures vary from the 12th to the 280th part of a line in thickness! It has been calculated that ten millions of their dead bodies lie in a cubic inch! 'Singly,' says a popular writer, 'they are the most unimportant of all animals; in the mass, forming as they do such enormous strata over a large part of the earth's surface, they have an importance greatly exceeding that of the largest and noblest of the beasts of the field.' Theirs is a safe humility; for while the greater creatures have many of them become extinct, and left no posterity, the descendants of these ancient earth-architects live and thrive to this very hour. The polishing-slate, or tripoli of Bilin, presents us with another instance in point. The investigations of that greatest of microscopical observers, Professor Ehrenberg, have shown that this substance consists almost entirely of an aggregation of infusoria in layers, without any connecting medium. These are much more minute than the chalk animalcules. A cubic line contains about twenty-three millions of them, and a cubic inch has been calculated to be the cenotaph of forty thousand millions of these beings! The weight of a cubic inch is about 220 grains, and that of the siliceous shield of a single animalcule is estimated at the

187,000,000th part of a grain! The infusorial rock at Bilin forms a bed fourteen feet in thickness, and about fifty hundredweight is annually consumed of it at Berlin for different purposes. Two origins are now ascribed to limestone—one, that of chemical precipitation; the other, which has a direct connection with our subject, ascribes the formation to the labours of the infusoria. There can be no doubt that many of the enormous beds of this substance with which we are familiar are the results of the accumulation of innumerable millions of these tiny creatures. They swarm in all waters, indifferently in salt as in fresh; and secreting from the lime held in solution by such water the necessary material for their shields or calcareous skeletons, they form by their enormous aggregation, in process of time, the vast strata of which we speak. For this purpose, it is necessary that they should be capable of multiplying immensely; and this they do by the different processes of spontaneous fissuration, gemmation, and the development of ova. The white calcareous earth so common at the bottoms of bogs and morasses has its origin in the ceaseless labours of these creatures; and the 'bog-iron ore' of geologists consists of the ferruginous shields of others. Thus, as has been aptly remarked by the old Latin proverb, 'iron, flint, and lime, all formed by worms,' which was probably a sly sarcasm against philosophy, modern science has shown to be actually true in the history of the animalcules. The Great Pyramid of Egypt has been looked upon by men as a miracle of human power and skill: yet every stone in its composition is a greater far, for the limestone of which this vast structure is built was erected long ago by an army of humble animalcules more numerous than all the hosts of a thousand Pharaohs. It has been finely said by Young—

'Where is the dust that has not been alive!'

though perhaps he little knew the wide application of the truth he was enunciating. In Lapland, we are told that in certain places there exists a stratum of earth called *bergmehl*, full of fossil animalcules. It contains four per cent. of animal matter, for the sake of which the wretched inhabitants, when hard pressed for food, collect this earth, and mixing it up with a portion of the bark of trees ground to powder, use it as food. The town of Richmond in Virginia is entirely built on a bed of siliceous marl composed of these creatures, and on the average about twenty feet in thickness.

From the consideration of these stupendous results of animalcule labour, we may turn to the equally interesting one of that of the zoophytes. When we mention the term coral formations, it will certainly convey to the major part of our readers that impression of the vast importance of apparently insignificant beings which we desire, since, thanks to the interesting and popular character of many of our valuable scientific works, much information on the subject is now abroad. Let us, however, mention a few of the remarkable works executed by these indefatigable labourers. Captain Flinders describes a coral-reef on the east coast of New Holland which is 1000 miles long. In one part it is unbroken for a distance of 350 miles. Enormous masses of this structure also brave the fury of the wide-spread waters of the Pacific. These groups are from 1100 to 1200 miles long, by 300 or 400 in breadth. The following extract from that most interesting work, 'Darwin's Journal,' will convey a good idea of the extent of these labours in one spot—Keeling Island, which is an entire mass of coral.—'Such formations rank high amongst the wonderful objects of this world.

Captain Fitzroy found no bottom with a line 7200 feet long, at a distance of only 2200 yards from the shore. Hence this island forms a lofty submarine mountain, with sides steeper even than the most abrupt volcanic cone. The saucer-shaped summit is ten miles across; and every single atom, from the least particle to the largest fragment of rock in this great hill—which, however, is small compared with very many other lagoon islands—bears the stamp of having been subject to organic arrangement. We feel surprised,' he adds, 'when travellers tell us of the vast dimensions of the Pyramids and other great ruins; but how utterly insignificant are the greatest of them when compared to these mountains of stone accumulated by the agency of various minute and tender animals.'

The entomologist, jealous for the honour of his science, will tell us that a similar lesson may be learned by equally striking illustrations from the page of insect life; nor is it a violation of our prefatory compact to include the displays of insect power under the dynamics of insignificance. When countries have been shaved of their increase, when kings and councils have been perplexed, and whole nations have trembled, at the sound of an insect's wing, we are justified in giving their deeds a record in this place and on this occasion. Let him that can count the leaves of the thickest forest despise, if he can, the powers of that legion of caterpillars of which Reaumur speaks as having brought a premature winter upon a dense wood in France which he visited. Every tree was overrun with them; and in a brief time, from the refreshing green of spring, the whole scene assumed the parched brown aspect of late autumn. Such was the alarm excited, that an act of the government was called forth, decreeing that everybody should assist in the extermination of the insects. But they were not to be annihilated by 'act of parliament': cold and rain killed them. The Hessian fly, supposed to have been carried by the far less formidable Hessian troops from Germany, committed for a length of time the most awful ravages in North America. At one period it was thought they would annihilate the culture of wheat altogether. They came in enormous numbers, thickening the very air, crossing lakes and rivers like a cloud. In a tumbler of beer, 500 met death by drowning! The privy council, we are told, met day by day to consult what measures could be adopted to destroy these ravagers. Expresses were despatched to France, Austria, Prussia, and America, for full information; and the minutes of council and necessary documents fill upwards of 200 pages. All this about an insignificant fly! The weevils, likewise, have an evil name for their destroying powers. Every voyager knows them, and has watched their manœuvres in his biscuits, or has been on the point of swallowing hundreds in his soup. A great brewer used to say that he collected them out of his granaries by bushels; which cannot be wondered at, when we remember that a single pair will, in the course of one year, become surrounded with a family of 6000! Our grapes are often cut down for us, and withered before their time, by the larvæ of other insects. In the course of the last century they multiplied so excessively in Sweden, that numbers of meadows became white and dry, as if scorched. The larvæ of our childhood's friend, 'Daddy long-legs,' some years ago entirely destroyed hundreds of acres of the best and richest pasture-land, all becoming brown, dry, and dead. A piece of turf, a square foot in size, when examined, contained the enormous number of 210 grubs! After all, what are

these to the locusts, that oppressive scourge with which Providence occasionally visits nations? To quote a single instance:—In Russia, in 1650, they came at three points in vast multitudes; they darkened the very air, covered the earth, and in some places their dead bodies formed a stratum four feet deep; the trees literally bent under them, and were of course stripped clean in a very little time. On one occasion they are said to have been the indirect causes of the death of about a million men and animals. Surely here is a display of power which redeems insects from the stigma of insignificance!

But this is not all. The insect known as the *Teredo navalis* commits a more subtle, but scarcely less terrible work upon the wooden structures of our piers. The piers of Holland are suffering immensely from the destroying powers of this humble insect; and apprehensions are seriously entertained that, by its injuring the timber-work of the dams, the day may come when the country will be flooded. The authors of the 'Introduction to Entomology' tell us that the piers of Bridlington Harbour, in our own country, are going rapidly to ruin by the attacks of a little wood-louse! In three years they reduced a three-inch plank to less than an inch in thickness. What will be thought of our subject when we state that a ship of the line, a British man-of-war, was attacked by insects, and the vast structure more roughly handled than she had been in the severest action? So seriously, indeed, had she been injured, that it was only by firmly lashing her together that she could be saved from foundering with all on board! And lastly, the *termites*, or white ants, are worse still. Think of an army of puny insects sweeping away every relic of a village, or reducing a monarch of the forest to the thickness of brown paper; or, more audacious still, threatening the gorgeous palace of the governor-general of India with ruin! We may well join, then, with Mr Lyell, while wondering at the vast and often suddenly-created powers of the insect world, in saying, 'If, for the sake of employing on different but rare occasions a power of 200 horses, we were under the necessity of feeding all these animals at great cost in the intervals, we should greatly admire the invention of such a machine as the steam-engine, which was capable at any moment of exerting the same degree of strength without any consumption of food during the periods of inaction. The same kind of admiration is excited when we contemplate the powers of insect life, in the creation of which the Author of Nature has been so prodigal. A scanty number of minute individuals, to be detected only by careful research, are ready in a few days, weeks, or months, to give birth to myriads; but no sooner has the destroying commission been executed, than the gigantic power becomes dormant.'

Our final illustrations may be taken from the kingdom of inorganic nature. Our endeavour is to show the vast energies of the expansive force of such an insignificant thing as a drop of frozen water, or a foot of heated rock. Whoever has read Scoresby's interesting and valuable work on the arctic regions, must have been struck with the account he gives of the broken state of the rocks in Spitzbergen. On landing, he ascended the beach towards several hills of some elevation; but he found that climbing was almost impossible, in consequence of the excessively loose state of the stones on the surface. It was in vain to attempt to walk, as the feet lost their hold, and the traveller came down in a shower of stones. The only pace to be adopted was that of a sort of jumping run,

which proved inordinately fatiguing. 'These rocks,' he writes, 'appear solid in the distance, but on examination, they were found to be full of fractures in every direction, so that it was with difficulty that a specimen of *five or six pounds* in a solid mass could be obtained. The least movement sent floods of stones down the rock. Cliffs of a thousand feet were found fissured in every direction; and toward the sea-edge, stones weighing more than two or three ounces each could not be obtained. Darwin makes the same observation on Terra del Fuego and within the Andes. Here, he says, he often observed that where the rock was covered with snow, its surface was shivered in an extraordinary manner into small angular fragments. On the Cordilleras, the rock crumbles in great quantities, and masses of detritus slide down every spring like great avalanches. There can be no doubt that this enormous destruction of rock is due to a very simple cause. Many of our public buildings suffer in a similar manner; and in the severe winters of Quebec, the most serious damage is done to the granite piers by the same force. Yet the power which thus levels the great mountains by degrees, and brings them to communion with the dust of the lowly earth, is but the expansion of water, which, becoming infiltrated into their substance, or dropping into crevices, rends them asunder, when it is in the act of freezing, with a force nothing can resist. How important an agent this is in the work of renewing the earth we need scarcely say.

From certain experiments made in America by a gentleman of practical scientific research, it appears that it is impossible, in countries having a variation of more than 90 degrees Fahrenheit annual temperature, to construct a coping of stones five feet long in which the joints will be water-tight. Mr Lyell, proceeding on the calculations arrived at in these experiments, states that if we can suppose a mass of sandstone a mile in thickness to have its temperature raised 200 degrees Fahrenheit, it would lift a superincumbent layer of rock to the height of ten feet. 'But suppose a part of the earth's crust 100 miles thick, and equally expandable, the temperature of which was raised 600 or 700 degrees. This might produce an elevation of between 2000 and 3000 feet. The cooling of the same mass, again, might afterwards cause the overlying rocks to sink down again, and resume their original position. By such agency we might explain the gradual rise of Scandinavia.' Calculations have been made by geologists which appear to account for the elevation of land in Sweden by a rise of only 3 degrees temperature (Reaumur), supposing the stratum to be 140,000 feet thick. Upon a similar supposition, the rise and fall of the waters of the Caspian Sea might be explained, supposing its bed subject to alternate elevations and depressions of temperature. Again, if the strata were principally clay, as it is well known that that substance contracts when heated, we might account for the subsidence of land on the supposition that the clay strata were contracting under the influence of heat. No one at all acquainted with the enormous, the, in truth, immeasurable force of contraction and expansion under the influence of caloric, will feel a doubt that the cause assigned is at least adequate to the effects produced. Yet how insignificant a thing an icicle! how apparently inappreciable the amount of increase in a heat-expanded stone!

When all creation inculcates the same truth, it would be manifestly easy to multiply examples by rambling over many other equally interesting fields of study. But to give a complete view of the subject is neither within the scope, nor is it the legitimate object, of an 'article.' It appears, indeed, as if the wisdom and power of the Creator were in nothing more manifest than in the astonishing force He has committed to the charge, not of the great and mighty of this world of nature, but to the humble and individually feeble insect or animalcule. The remark of Sir John Herschel forms an apposite conclusion to our paper:—'To the

natural philosopher there is no natural object that is unimportant or trifling. From the least of nature's works he may learn the greatest lessons.'

A FRENCH ODDITY.

It was a warm sunny afternoon in the beginning of May, when, leaving my little chamber in the Rue des Beaux Arts, I bethought me of a stroll in the Tuileries Gardens. I sauntered along the quays on my side the Seine, now looking at a print, now stopping at a book-stall, until I came to the Pont Neuf, by which I crossed the water, and then proceeded direct to the gardens. The fountains were showering their bright rain in the sunshine, the parterre had been freshly done up, and the grass was vividly green; even the windows of the palace had all been mended, so as to show no signs of revolutionary violence. Everything looked neat, and beautiful, and pleasant. Above all was the clear crystal air of Paris, the atmosphere of which gives a transparency, and breathes an elasticity, which is preciously peculiar to the fair city of the Seine. I loitered a moment over the few flowers, and then passed on to the sunny dry parts, by the sides of which chairs are placed, and furnished at a sou a piece to those who desire their accommodation. On these were seated a bright array of French mammas, with their exquisite bonnets, and the hues of their dress so chastely chosen; and by them their nurses, in their various provincial costumes, with caps piled up with lace in all grotesquely graceful fashions, and arrayed in colours bright and decided, making the scene quite picturesque and piquant. Around played the children, little bonny brunettes or blushing blondes, full of gay grace or pretty pettishness. I could not, however, help again observing, as I had done the day before, while taking the same walk with my friend Elihu Burritt, the predominance of pugnacious playthings among the boys. Each little lad had a tiny tricolour, or a bit of a drum, or a tin sword by his side, supported duly by scabbard and belt. Many had guns, and some of these had even metal bayonets. French fame and French folly had already entered those little heads. It is a gay and pleasing sight, however—mammas, nurses, and children, in those sunny Tuileries Gardens. I thought of my own 'wee bairnies' and walked on.

I passed into the shade under the splendid chestnut trees—then brightly green in foliage, and beginning to show their groups of snowy-white flowers, delicately tinted with a blushing pink—to the right of the gardens from whence I had entered. I sat down on one of the fixed stone seats, at the foot of a chestnut which had perhaps the biggest bole and the most spreading umbrage of any in the place, and had just perused the third page of the last new revolutionary pamphlet, when my attention was distracted by a buzz and suppressed titter in the nearest path. I looked, and saw all eyes turned upon a strange figure which was strutting down the middle of the pathway. It was that of a young man, with an odd conformation of head, the forehead retreating, and the crown low, hair almost colourless, and without either hat or cap. He was dressed in a bright green coat with gilt buttons; he wore a red neckcloth, with the collar slightly turned over; and in one hand he carried an immense opera-glass, and in the other a switch of a cane, both of which he used in a most ridiculous fashion.

The poor creature was evidently of weak intellect. It was not 'Poor Joe,' down in our woodland village north of the Orwell; but his Sillyness of the Seine, fine in his folly, not *un sot*, but *un simple*, cackling with conceit, a goose of glory. On he promenaded along the path, apparently unaccompanied, except by the glances of the curious. Wishing to study a specimen of the French fool, I rose and followed at a little distance, skirting along the trees, so as to be unobserved by my subject, and thus to avoid the possibility of giving him pain. Rumour ran before him,

and fame followed him. He by no means avoided attraction. Now he grimaced with his hand, smoothing down his hairless chin: now he twirled his little yellow cane in all kinds of curious circles, until it flew from his hand, and he was compelled to the undignified action of stooping to pick it up: now he seemed to be humming a song, sensibly to his own satisfaction. He was in his greatest glory, however, with his opera-glass. Every now and then he applied it to his eye, and took a sweeping survey of everything within sight. As ladies approached, he exhibited himself to perfection. He was evidently fascinated with the fair; and when any appeared within about eight or ten yards of him, he halted, drew himself up in a position in which his two legs were close together, and duly placing his cane under one arm, deliberately levelled the barrel of his glass at the fresh faces which fronted him. Having thus done execution, to the dismay of some, and to the laughter of others, and to his own entire satisfaction, he lowered his glass, and jauntily journeyed on.

Fate, however, follows fame, and glory glides away. Some *gamins*, observing our hero, followed him, evidently having an intelligence among themselves, for some time closely. At length he entered the circular walk at the end of the gardens nearest the Champs Elysées. Here some of the lads continued to follow his steps, while others went round the other way, on purpose to meet him. Our hero had fallen into the trap. He continued his round, and was met, as intended, by the oldest lad, who, touching his cap—for the French are ever polite, even in fun—said, 'I hope monsieur is enjoying his promenade?' 'Yes, yes, monsieur,' was the answer, for the French even say *monsieur* to boys of five or six. A few more words were exchanged, which I did not catch, and then, 'Will you oblige me with your arm?' said the dirty, ragged gamin. It was enough. Our hero was off. In an instant his self-satisfied look was changed to one of the extremest distress. His walk, before so smart, so stylish, or so solemn, was metamorphosed into an exit composed of shuffling, wading, swimming, running, and flying. His opera-glass was plunged into his pocket, his cane held tightly in his hand, and with his arms rowing like awkward wings, his knees knocking together, his head poked out, and his back bent in, he either fled or flew, and I soon lost sight of the French fool amid the chest-nuts. 'Will you oblige me with your arm, monsieur?' said the gamin; but love of fame and vainglory would have nothing to do with such liberty, equality, and fraternity. In walking home, I thought that the poor French fool was, after all, only an exaggerated type of the defects in his national character; and that beneath the fact which had passed before me something of a moral lay concealed—namely, that republican institutions would have considerable difficulty in harmonising with French foolery.

DR CHANNING.

DR CHANNING'S writings have been widely diffused, and have exerted a remarkable influence in this country as well as in America. Our natural desire to know the history of a mind the workings of which have been so powerful, and to see how far the lofty ideal of a writer is embodied in his own life, is gratified by a copious memoir of him just published by his nephew. We shall extract a short account of him from this large work, which is reprinted in England, under the protection of a late copyright law.

William Ellery Channing was born at Newport, Rhode Island, United States, on the 7th of April 1780. His maternal grandfather, William Ellery, was a man of eminence, and at one period a member of Congress. He lived to the age of ninety-three, and his beneficial influence was gratefully acknowledged by his namesake. His father, William Channing (whose grand-

father emigrated from Dorsetshire in 1712), was an able lawyer, and attorney-general of his native state. He was an hospitable, benevolent, and religious man, and had deep horror at profaneness. His son 'owed it to him, that though living in the atmosphere of this vice, no profane word ever passed his lips.' His wife, who lived to the age of eighty-two, and was treated by Dr Channing with great filial reverence, was remarkable for her rectitude and simplicity of character, and for an entire truthfulness too rarely to be found. She exercised a scrupulous thoroughness in her domestic details, and was somewhat rigid in her discipline. William was early remarkable for purity and self-command: he avoided bad company, and was accustomed, in a gentle tone, which removed offence, to rebuke all obscenity and profaneness. He was early actuated by the rule—not to let the left hand know what his right hand did. He had a peculiar regard for the rights and feelings of others; and his tenderness was manifested in his treatment of animals; and he was equally distinguished by noble-heartedness and courage. These features of his character are displayed in interesting anecdotes. His father's death in 1793, which left his family in very reduced circumstances, stimulated his independent energy and foresight for others; but a shade of premature seriousness was given to his temper.

At fourteen, he entered Harvard University, at Cambridge, near Boston, United States. As a boy, he was noted rather for his contemplative habits than for his attainments. He had not been a quick scholar, and his anxiety to understand thoroughly whatever was presented to him gave him the appearance of dulness. It is said that he found the difficulties of acquiring Latin to be insurmountable, until an assistant in his father's office, taking pity on the plodding boy, gave him such assistance as helped him forward. The first step being taken, his progress in the classics was rapid; but his chief taste was philosophy; and with noble aspirations, he possessed an early ardour for freedom. As a student, he was remarkable for the eloquence and beauty of his compositions.

Those who knew him in after-life as a frail, attenuated invalid, would hardly recognise this description of him by his fellow-student Washington Allston, the poet-painter:—'Though small in stature, his person at that time was rather muscular than slender. I should think it was even athletic, from the manner in which he prolonged the contests with heavier antagonists in the wrestling-matches that were then common among the students; and for animal spirits he was no less remarkable than for his intellectual enthusiasm, amounting occasionally to unrestrained hilarity, but never passing the bounds of propriety. I well remember his laugh, which could not have been heartier without being ostreperous.' He records with deep gratitude that he was preserved from the contagion that surrounded him. 'The state of morals among the students was anything but good; but poverty, a dread of debt, well-chosen friends, the pleasures of intellectual improvement, regard to my surviving parent, and an almost instinctive shrinking from gross vice, to which natural timidity and religious principle contributed not a little, proved effectual safeguards. Had the bounds of purity once been broken, I know not that I should ever have returned to virtue.' He and his friend Story (afterwards an eminent judge) declined the use of wine even at convivial entertainments.

His classmates urged him to apply himself to law, as affording the best field for his eloquence; but he writes, 'In my senior year, the prevalence of infidelity, imported from France, led me to inquire into the evidences of Christianity, and then I found for what I was made. My heart embraced its great objects with an interest which has been increasing to this hour.'

After leaving college, at the age of eighteen, he spent part of two years at Richmond, Virginia, as tutor to the

family of Mr Randolph, a gentleman of station. This period exerted an important influence over his whole life. He saw quite a different phase of society, and heard opinions which were new to him. He admired a generosity and frankness which contrasted favourably with the avarice and calculating prudence of the north. He was, however, disgusted by the sensuality that prevailed, and saw that the demoralising influences of slavery, which, however, had not reached their subsequent enormity, extended to the master as well as to his victim.

'Absorbed in the duty of teaching during the day, and living much apart from the family, Mr Channing was prompted by his wish for quick advancement to pass most of the night in study. He usually remained at his desk till two or three in the morning, and often saw the day break before retiring to rest. He had also gained from the Stoics, and from his own pure standard of virtue, ascetic notions of curbing the animal nature, and of hardening himself for difficult duties. For the purpose of overcoming effeminacy, he accustomed himself to sleep on the bare floor, and would spring up at any hour of waking to walk about in the cold.' He suffered from insufficient clothing, as he did not allow himself to use the money sent him from home; and he spent his salary in the purchase of books. He found himself too meanly clad to accept the invitations which would have cheered his spirits. 'This slight experience of poverty sank deep into his memory, and gave him through life most tender compassion for the needy.' He 'passed through intellectual and moral conflicts, through excitements of heart and mind, so absorbing, as often to banish sleep, and to destroy almost wholly the power of digestion.' He 'was worn well-nigh to a skeleton.' From his ignorance of the laws of nature, he sinned against his bodily constitution, and suffered accordingly. In his system were planted the germs of disease, the growth of which overshadowed his whole life, and greatly diminished his powers of usefulness.

On his return from Richmond, a thin and pallid invalid, he remained a year and a half at home, pursuing his theological studies, and instructing one or two pupils. He had access to a valuable public library; and what was of more consequence to one of his susceptible temperament, to a fine sea-coast; which he visited, not like Demosthenes, to make his eloquence audible amidst the waves, but to awaken his soul by the voice of nature. 'No spot on earth,' he says, 'has helped to form me so much as that beach: there I lifted up my voice in praise amidst the tempest: there, softened by beauty, I poured out my thanksgiving and contrite confessions: there, in reverential sympathy with the mighty power around me, I became conscious of the power within: there, struggling thoughts and emotions broke forth, as if moved to utterance by nature's eloquence of the winds and waves: there began a happiness, surpassing all worldly pleasures, all gifts of fortune—the happiness of communing with the works of God.' This delight in nature pervaded his life; and many portions of his biography manifest his enthusiasm for scenery, and his discriminating perception of its peculiar beauties.

In 1808 he resided at Cambridge as regent of the college, an office the duty of which was to exercise a general superintendence over the building in which he lived, and which allowed him ample time for self-improvement. At this period he seems to have read less than he thought and wrote. He thought it better that a few thoughts should be clearly impressed on his mind, than that he should be lost in the chaos of universal knowledge, which had hitherto distracted him. The unsleeping vigilance of conscience which distinguished his moral also pervaded his intellectual nature. He would not rest content in superficial glimpses of a truth, but desired to view it in all its bearings, and listened with the utmost candour to every objection. He had an 'unappeasable desire to obtain such a view of any subject as should have coherent wholeness in itself, and

be at unity with other views which he regarded as established.' When he read, he had his pen in hand, and noted questions, hints, statements, germs of interesting views, &c. which were afterwards accurately classified. And when engaged in thought, he would write down what occurred to him, as a means of gaining clearness and definiteness.
